A General Plan of Instruction

A basic understanding of measurement suggests how to help children develop a conceptual knowledge of measuring.

Conceptual Knowledge to Develop	Type of Activity to Use
1. Understand the attribute being measured.	1. Make comparisons based on the attribute.
2. Understand how filling, covering, matching, or making other comparisons of an attribute with units produces what is called a measure.	2. Use physical models of measuring units to fill, cover, match, or make the desired comparison of the attribute with the unit.
3. Understand the way measuring instruments work.	3. Make measuring instruments and use them along with actual unit models to compare how each works.

Van de Walle, John A. (2001). Elementary and middle school mathematics: Teaching developmentally. New York: Addison Wesley Longman, Inc.

STAGES IN THE DEVELOPMENT OF MEASUREMENT

COMPARISON

- Direct - contrast/comparison
- Seriation - order by size, mass, area etc.
- Indirect (length only)

NON-STANDARD

- Quantification
- Constant Unit

STANDARD – SI Units

Area Measurement

Area of a Rectangle = # of squares in each row

X

of rows

In this rectangle, there are six squares in the first row, so there must be six squares in every row. There are three rows. The area is $6 \times 3 = 18$ square units.

When we have a figure for which there is no area formula, we arrange the shape to get a figure for which we have an area formula.

Volume Measurement

Volume = # of cubes in the first layer

X

of layers

When we have a shape for which we do not have a volume formula, we arrange the volume into a shape for which we do have a formula.

Estimation & Measurement

“Measurement Sense”

Strategies:
Referents
Chunking
Unitizing

Real life Application

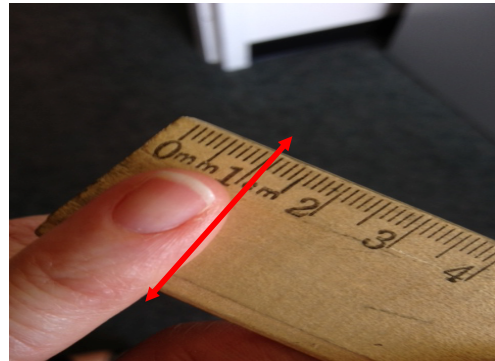

Referents

About how long is...

1 cm?

About the width of
your

10 cm?

About the width of
your

10,000 cm or 100 m?

About the length of a ...

100 cm or 1 m?

About the height of a ...

1000 cm or 10 m?

About the height of a ...

Your turn:

Name another "thing" that is about as long as

1 cm _____

10 cm _____

10,000 cm or 100 m _____

100 cm or 1 m _____

1000 cm or 10 m _____

How Many Jelly Beans

This jar is full of jelly beans

Estimate about how many jelly beans are in the jar _____

This cup holds about 25 jelly beans.

Four cups of jelly beans have been poured into the jar.

About how many jelly beans do you think are in the jar now? _____

One cup of jelly beans has been poured in the jar.

Now estimate about how many jelly beans are in the jar _____

How to Teach Measurement

- Measure frequently and often using real problems when ever possible
- Actively “DO” and experiment rather than passively observe
- Emphasize the important ideas of measurement that transfer or work across measurement systems
- Include estimation in the development of measurement
