# CONTENTS

Welcome to Pre-Health Sciences Mathematics 1!	xi
Acknowledgements	xii
About This Book	xiv

## Unit 1: The Real Numbers and Introduction to Algebra

1.0 Introduction	3
1.1 Introduction to Whole Numbers	4
1.2 Introduction to the Language of Algebra	33
1.3 Integers	73
1.4 Fractions	147
1.5 Decimals	201
1.6 The Real Numbers	241
1.7 Properties of Real Numbers	277
1.8 Unit Sources	313

## Unit 2: Measurement

2.0 Introduction	317
2.1 Systems of Measurement	319
2.2 Accuracy, Precision, and Rounding Rules	366
2.3 Scientific Notation	387
2.4 More Unit Conversions and Rounding Rules	403
2.5 Unit Sources	423

## Unit 3: Solving Linear Equations, Graphs of Linear Equations, and Applications of Linear Functions

3.0 Introduction	427
3.1 Solve Equations Using the Subtraction and Addition Properties of Equality	430
3.2 Solve Equations using the Division and Multiplication Properties of Equality	455
3.3 Solve Equations with Variables and Constants on Both Sides	482
3.4 Use a General Strategy to Solve Linear Equations	500
3.5 Solve Equations with Fractions or Decimals	522
3.6 Solve a Formula for a Specific Variable	542
3.7 Use a Problem-Solving Strategy and Applications	563
3.8 Solve Mixture and Uniform Motion Applications	619
3.9 Graph Linear Equations in Two Variables	664
3.10 Slope of a Line	754
3.11 Find the Equation of a Line	844
3.12 Linear Functions and Applications of Linear Functions	873
3.13 Unit Sources	891

## Unit 4: Systems of Linear Equations

4.0 Introduction	895
4.1 Solve Systems of Equations by Graphing	896
4.2 Solve Systems of Equations by Substitution	936
4.3 Solve Systems of Equations by Elimination	966
4.4 Solve Applications with Systems of Equations	993
4.5 Solve Mixture Applications with Systems of Equations	1021
4.6 Unit Sources	1040

## Unit 5: Introduction to Polynomials

5.0 Introduction	1043
5.1 Add and Subtract Polynomials	1044
5.2 Use Multiplication Properties of Exponents	1068
5.3 Multiply Polynomials	1091
5.4 Special Products	1120
5.5 Divide Monomials	1144
5.6 Divide Polynomials	1203
5.7 Introduction to Graphing Polynomials	1229
5.8 Unit Sources	1252

## Unit 6: Geometry and Trigonometry

6.0 Introduction	1255
6.1 Use Properties of Angles, Triangles, and the Pythagorean Theorem	1256
6.2 Use Properties of Rectangles, Triangles, and Trapezoids	1299
6.3 Solve Geometry Applications: Circles and Irregular Figures	1345
6.4 Solve Geometry Applications: Volume and Surface Area	1367
6.5 Sine, Cosine and Tangent Ratios and Applications of Trigonometry	1405
6.6 Unit Sources	1438

## Extra Practice Problems

Exercises: Introduction to Whole Numbers (1.1)	1443
Exercises: Introduction To the Language of Algebra (1.2)	1461
Exercises: Integers (1.3)	1480
Exercises: Fractions (1.4)	1495
Exercises: Decimals (1.5)	1534

Exercises: The Real Numbers (1.6)	1557
Exercises: Properties of Real Numbers (1.7)	1573
Exercises: Systems of Measurement (2.1)	1593
Exercises: Accuracy, Precision, and Rounding Rules (2.2)	1610
Exercises: Scientific Notation (2.3)	1620
Exercises: More Unit Conversions and Rounding Rules (2.4)	1628
Exercises: Solve Equations Using the Subtraction and Addition Properties of Equality (3.1)	1634
Exercises: Solve Equations using the Division and Multiplication Properties of Equality (3.2)	1648
Exercises: Solve Equations with Variables and Constants on Both Sides (3.3)	1665
Exercises: Use a General Strategy to Solve Linear Equations (3.4)	1675
Exercises: Solve Equations with Fractions or Decimals (3.5)	1689
Exercises: Solve a Formula for a Specific Variable (3.6)	1699
Exercises: Use a Problem-Solving Strategy and Applications (3.7)	1711
Exercises: Solve Mixture and Uniform Motion Applications (3.8)	1740
Exercises: Graph Linear Equations in Two Variables (3.9)	1757
Exercises: Slope of a Line (3.10)	1830
Exercises: Find the Equation of a Line (3.11)	1880
Exercises: Linear Functions and Applications of Linear Functions (3.12)	1906
Exercises: Solve Systems of Equations by Graphing (4.1)	1925
Exercises: Solve Systems of Equations by Substitution (4.2)	1940
Exercises: Solve Systems of Equations by Elimination (4.3)	1951
Exercises: Solve Applications with Systems of Equations (4.4)	1964
Exercises: Solve Mixture Applications with Systems of Equations (4.5)	1976
Exercises: Add and Subtract Polynomials (5.1)	1985
Exercises: Use Multiplication Properties of Exponents (5.2)	2002
Exercises: Multiply Polynomials (5.3)	2035
Exercises: Special Products (5.4)	2057
Exercises: Divide Monomials (5.5)	2068
Exercises: Divide Polynomials (5.6)	2089

Exercises: Use Properties of Angles, Triangles, and the Pythagorean Theorem (6.1)	2100
Exercises: Use Properties of Rectangles, Triangles, and Trapezoids (6.2)	2117
Exercises: Solve Geometry Applications: Circles and Irregular Figures (6.3)	2135
Exercises: Solve Geometry Applications: Volume and Surface Area (6.4)	2153
Exercises: Sine, Cosine and Tangent Ratios and Applications of Trigonometry (6.5)	2165
Versioning History	2179
Glossary Terms	2180

# WELCOME TO PRE-HEALTH SCIENCES MATHEMATICS 1!

---

Welcome to Pre-Health Sciences (PHS), and in particular, to MATH-1024!

In this course, we will cover the following topics.

- [Unit 1: The Real Numbers and Introduction to Algebra](#)
- [Unit 2: Measurement and Rounding Rules](#)
- [Unit 3: Solving Linear Equations, Graphs of Linear Equations, and Applications of Linear Functions](#)
- [Unit 4: Systems of Linear Equations](#)
- [Unit 5: Introduction to Polynomials](#)
- [Unit 6: Geometry and Trigonometry](#)

Through our coverage of these topics, we will have the main goal of developing resilience, critical thinking skills, and self-directed learning skills. In addition to these transferable skills, we will aim to develop your attention to detail, determination, time management skills, as well as your mental mathematics skills.

In health care, making a small calculation error can be life threatening, and therefore, it is essential that we develop our intuition with numbers and mathematics throughout the PHS math program. To do this, we will often work without a calculator to improve on our mathematical abilities.

Mathematics can be challenging, and it is critical that students keep an open-mind and remain positive. Remember that it takes a lot of practice to develop these foundational skills, so if you do not succeed right away, stay patient, ask for help, and keep working hard!

# ACKNOWLEDGEMENTS

---

This open textbook has been compiled and adapted by Sav Spilotro, in partnership with the [OER Design Studio](#) and the Library Learning Commons at [Fanshawe College](#) in London, Ontario. This work is part of the FanshaweOpen learning initiative and is made available through a [Creative Commons Attribution-ShareAlike 4.0 International License](#) unless otherwise noted.

## Collaborators

This project was a collaboration between the author and the team in the OER Design Studio at Fanshawe. The book was significantly re-formatted in Pressbooks to ensure accessibility.

The following staff and students were involved in the creation of this project:

- Catherine Steeves – *Instructional Designer*
- Melanie Mitchell Sparkes – *Instructional Design Student*
- Fere Zohari – *Instructional Design Student*
- Alyssa Giles – *Graphic Design Student*
- Salma Habib- *Graphic Design Student*
- Robert Armstrong – *Graphic Design*
- Shauna Roch – *Project Lead*

# ABOUT THIS BOOK

---

## Changes From Adapted Resource

Overall significant work was done on this version of the text to improve the accessibility and format from the import from Open Stax and other resources.

All mathematical notation was written in LaTeX to allow for MathJax functionality. MathJax provides the following accessibility features:

- Automatic magnification on hover
- Text-to-speech options
- Collapsible math
- Highlight, foreground, and background customization
- The ability to translate math into other syntaxes
- MathJax options in over 20 languages

See the full extent of MathJax's accessibility features in [their documentation](#).

In addition the following formatting changes were made:

- The majority of images that included math were replaced with LaTeX
- Images were recolored for contrast
- Examples were reformatted into steps for ease of understanding

Specific content changes from the adapted resources can be found in the table below.

- 
- Unit 1** All sections from [Elementary Algebra 2e](#) Combined the Fractions sections into one.
- Section 2.1* – Combined parts from [Elementary Algebra 2e](#) Section 1.10 with Mathematics for Public and Occupational Health Professionals (1.3 Measurement Systems) and Business/Technical Mathematics (6.1) examples related to health care taken and included in section. Order of the parts was changed as well to put metric system first and then the U.S./Imperial system. Extended some tables to include extra metric prefixes.
- Unit 2** Edited for readability.
- Section 2.2* -Added some content on exact vs inexact numbers, and rounding with mixed operations.
- Section 2.3*– Added small section on scientific notation and significant figures and some examples to include how to preserve significant figures in scientific notation and decimal notation.
- Section 2.4* – Examples and content from Rounding Rules When Converting Within the Same System of Measurement created.
- Unit 3** Most sections are adapted from [Elementary Algebra 2e](#). Some sections were combined from chapters 3 and 4 and some content was rearranged.
- Unit 4** All sections adapted from Elementary algebra chapter 5. Some sections combined.
- Unit 5** All sections from [Elementary Algebra 2e](#) chapter 6.
- Section 5.8 was created. Graphs created using desmos.com graphing calculator.
- Unit 6** Images added to provide a health profession perspective.
- 

## Accessibility Statement

We are actively committed to increasing the accessibility and usability of the textbooks we produce. Every attempt has been made to make this OER accessible to all learners and is compatible with assistive and adaptive technologies. We have attempted to provide closed captions, alternative text, or multiple formats for on-screen and off-line access.

The web version of this resource has been designed to meet [Web Content Accessibility Guidelines 2.0](#), level AA. In addition, it follows all guidelines in [Appendix A: Checklist for Accessibility](#) of the [Accessibility Toolkit – 2nd Edition](#).

In addition to the web version, additional files are available in a number of file formats including PDF, EPUB (for eReaders), and MOBI (for Kindles).

If you are having problems accessing this resource, please contact us at [oes@fanshawec.ca](mailto:oes@fanshawec.ca).

Please include the following information:

- The location of the problem by providing a web address or page description
- A description of the problem
- The computer, software, browser, and any assistive technology you are using that can help us diagnose and solve your issue (e.g., Windows 10, Google Chrome (Version 65.0.3325.181), NVDA screen reader)

## Feedback

To provide feedback on this text please contact **oes@fanshawec.ca**.

Pedrosa, L. (2019, July 10). MathJax: now available on PressbooksEDU. Pressbooks. <https://pressbooks.com/new-features/mathjax-now-available-on-pressbooksedu/>

# UNIT 1: THE REAL NUMBERS AND INTRODUCTION TO ALGEBRA

## Chapter Outline

- [1.0 Introduction](#)
- [1.1 Introduction to Whole Numbers](#)
- [1.2 Introduction to the Language of Algebra](#)
- [1.3 Integers](#)
- [1.4 Fractions](#)
- [1.5 Decimals](#)
- [1.6 The Real Numbers](#)
- [1.7 Properties of Real Numbers](#)
- [1.8 Unit Sources](#)

# 1.0 INTRODUCTION

---

Figure 1.0.1 In order to be structurally sound, the foundation of a building must be carefully constructed.  
Photo by [Open Stax CC-BY 4.0](#)

In order to be structurally sound, the foundation of a building must be carefully constructed. Just like a building needs a firm foundation to support it, your study of algebra needs to have a firm foundation. To ensure this, we begin this book with a review of arithmetic operations with whole numbers, integers, fractions, and decimals, so that you have a solid base that will support your study of algebra.

# 1.1 INTRODUCTION TO WHOLE NUMBERS

## Learning Objectives

By the end of this section, you will be able to:

- Use place value with whole numbers
- Identify multiples and apply divisibility tests
- Find prime factorizations and least common multiples

As we begin our study of elementary algebra, we need to refresh some of our skills and vocabulary. This chapter will focus on whole numbers, integers, fractions, decimals, and real numbers. We will also begin our use of algebraic notation and vocabulary.

## Use Place Value with Whole Numbers

The most basic numbers used in algebra are the numbers we use to count objects in our world: 1, 2, 3, 4, and so on. These are called the **counting numbers**. Counting numbers are also called *natural numbers*. If we add zero to the counting numbers, we get the set of whole numbers.

Counting Numbers: 1, 2, 3, ...

Whole Numbers: 0, 1, 2, 3, ...

The notation “...” is called ellipsis and means “and so on,” or that the pattern continues endlessly.

The numbers on the **number line** get larger as they go from left to right and smaller as they go from right to left. While this number line shows only the whole numbers 0 through 6, the numbers keep going without end.

Our number system is called a place value system, because the value of a digit depends on its position in a

number. Figure 1.1 shows the place values. The place values are separated into groups of three, which are called periods. The periods are *ones*, *thousands*, *millions*, *billions*, *trillions*, and so on. In a written number, commas separate the periods.

Place Value														
Trillions			Billions			Millions			Thousands			Ones		
Hundred trillions	Ten trillions	Trillions	Hundred billions	Ten billions	Billions	Hundred millions	Ten millions	Millions	Hundred thousands	Ten thousands	Thousands	Hundreds	Tens	Ones
								5	2	7	8	1	9	4

Figure 1.1

### Example 1.1.1

In the number 63,407,218, find the place value of each digit:

- 7
- 0
- 1
- 6
- 3

#### Solution

Place the number in the place value chart:

Trillions			Billions			Millions			Thousands			Ones		
Hundred trillions	Ten trillions	Trillions	Hundred billions	Ten billions	Billions	Hundred millions	Ten millions	Millions	Hundred thousands	Ten thousands	Thousands	Hundreds	Tens	Ones
							6	3	4	0	7	2	1	8

Figure 1.2

- The 7 is in the thousands place.
- The 0 is in the ten-thousands place.
- The 1 is in the tens place.
- The 6 is in the ten-millions place.
- The 3 is in the millions place.

## Try It

1) For the number 27,493,615, find the place value of each digit:

- 2
- 1
- 4
- 7
- 5

## Solution

- a. ten millions
- b. tens
- c. hundred thousands
- d. millions
- e. ones

2) For the number 519,711,641,328, find the place value of each digit:

- a. 9
- b. 4
- c. 2
- d. 6
- e. 7

### Solution

- a. billions
- b. ten thousands
- c. tens
- d. hundred thousands
- e. hundred millions

When you write a check, you write out the number in words as well as in digits. To write a number in words, write the number in each period, followed by the name of the period, without the *s* at the end. Start at the left, where the periods have the largest value. The ones period is not named. The commas separate the periods, so wherever there is a comma in the number, put a comma between the words (see below). The number 74,218,369 is written as seventy-four million, two hundred eighteen thousand, three hundred sixty-nine.

$$\underbrace{74}, \underbrace{218}, \underbrace{369} \xleftarrow{\text{periods}}$$

*millions   thousands   ones*

74 → *Seventy – four million,*

218 → *two hundred eighteen thousand,*

369 → *three hundred sixty nine*

## HOW TO

### Name a Whole Number in Words

1. Start at the left and name the number in each period, followed by the period name.
2. Put commas in the number to separate the periods.
3. Do not name the ones period

### Example 1.1.2

Name the number 8,165,432,098,710 using words.

#### Solution

**Step 1: Name the number in each period, followed by the period name.**

8	,	165	,	432	,	098	,	710
trillions		billions		millions		thousands		ones

8 → *Eight trillion,*

165 → *One hundred sixty – five billion,*

432 → *Four hundred thrity – two million,*

098 → *Ninety – eight thousand,*

710 → *seven hundred ten*

**Step 2: Put the commas in to separate the periods.**

So, 8,165,432,098,710 is named as eight trillion, one hundred sixty-five billion, four hundred thirty-two million, ninety-eight thousand, seven hundred ten.

## Try It

3) Name the number 9,258,137,904,061 using words.

**Solution**

Nine trillion, two hundred fifty-eight billion, one hundred thirty-seven million, nine hundred four thousand, sixty-one.

4) Name the number 17,864,325,619,004 using words.

**Solution**

Seventeen trillion, eight hundred sixty-four billion, three hundred twenty-five million, six hundred nineteen thousand four.

We are now going to reverse the process by writing the digits from the name of the number. To write the number in digits, we first look for the clue words that indicate the periods. It is helpful to draw three blanks for the needed periods and then fill in the blanks with the numbers, separating the periods with commas.

## HOW TO

### Write a Whole Number Using Digits

1. Identify the words that indicate periods. (Remember, the ones period is never named.)
2. Draw three blanks to indicate the number of places needed in each period. Separate the periods by commas.
3. Name the number in each period and place the digits in the correct place value position.

### Example 1.1.3

Write *nine billion, two hundred forty-six million, seventy-three thousand, one hundred eighty-nine* as a whole number using digits.

#### Solution

##### Step 1: Identify the words that indicate periods.

Except for the first period, all other periods must have three places. Draw three blanks to indicate the number of places needed in each period.

##### Step 2: Separate the periods by commas.

Then write the digits in each period.

<i>billions</i> <i>nine billion</i>	<i>millions</i> <i>two hundred forty-six million</i>	<i>thousands</i> <i>seventy-three thousand</i>	<i>ones</i> <i>one hundred eighty-nine</i>
9	246	073	189

The number is 9,246,073,189.

### Try It

5) Write the number two billion, four hundred sixty-six million, seven hundred fourteen thousand, fifty-one as a whole number using digits.

#### Solution

2,466,714,051

6) Write the number eleven billion, nine hundred twenty-one million, eight hundred thirty thousand, one hundred six as a whole number using digits.

#### Solution

11,921,830,106

In 2013, the U.S. Census Bureau estimated the population of the state of New York as 19,651,127. We could say the population of New York was approximately 20 million. In many cases, you don't need the exact value; an approximate number is good enough.

The process of approximating a number is called rounding. Numbers are rounded to a specific place value, depending on how much accuracy is needed. Saying that the population of New York is approximately 20 million means that we rounded to the millions place.

### Example 1.1.4

Round 23,658 to the nearest hundred.

#### Solution

**Step 1: Locate the given place value with an arrow. All digits to the left do not change.**

Locate the hundreds place 23,658.

Hundredths place. 23, 658  
↑

**Step 2: Underline the digit to the right of the given place value.**

Underline the 5, which is to the right of the hundreds place.

Hundredths place. 23, 658

**Step 3: Is this digit greater than or equal to 5?**

Yes – add 1 to the digit in the given place value.

Add 1 to the 6 in the hundred place, since 5 is greater than or equal to 5.

Add 1. 23, 658

**Step 4: Replace all digits to the right of the given place with zeros.**

Replace all digits to the right of the hundreds place with zeros.

Replace with zeros. 23,**700**

## Try It

7) Round to the nearest hundred: 17,852.

**Solution**

17,900

8) Round to the nearest hundred: 468,751.

**Solution**

468,800

## Round Whole Numbers.

1. Locate the given place value and mark it with an arrow. All digits to the left of the arrow do not change.
2. Underline the digit to the right of the given place value.
3. Is this digit greater than or equal to 5?
  - Yes—add 1 to the digit in the given place value.
  - No—do *not* change the digit in the given place value.
4. Replace all digits to the right of the given place value with zeros.

## Examples 1.1.5

Round 103,978 to the nearest:

- a. hundred
- b. thousand
- c. ten thousand

### Solution

a.

**Step 1: Locate the hundreds place in 103,978.**

**Hundreds place:** 103, 978

**Step 2: Underline the digit to the right of the hundreds place.**

**Hundreds place:** 103, 978

**Step 3: Since 7 is greater than or equal to 5, add 1 to the 9. Replace all digits to the right of the hundreds place with zeros.**

$$\text{Hundreds place: } 103, \boxed{\begin{array}{l} \textcolor{red}{9} \\ \underbrace{\phantom{00}} \text{Add 1} \\ 9+1=10 \\ \text{replace 9 with 0} \\ \text{and carry the 1} \end{array}} \overbrace{78}^{\text{replace with 0s}} = 104,000$$

So, 104,000 is 103,978 rounded to the nearest hundred.

b.

**Step 1: Locate the thousands place and underline the digit to the right of the thousands place.**

**Thousands place:** 10 3, 978

**Step 2: Since 9 is greater than or equal to 5, add 1 to the 3. Replace all digits to the right of the hundreds place with zeros.**

$$\text{Thousands place: } 10 \boxed{\begin{array}{l} \textcolor{red}{3} \\ \underbrace{\phantom{00}} \text{Add 1} \\ 3+1=4 \\ \text{replace 3 with 4} \end{array}} \overbrace{978}^{\text{replace with 0s}} = 104,000$$

So, 104,000 is 103,978 rounded to the nearest thousand.

c.

**Step 1: Locate the ten thousands place and underline the digit to the right of the ten thousands place.**

Ten thousands place: 103,978

**Step 2: Since 3 is less than 5, we leave the 0 as is, and then replace the digits to the right with zeros.**

100,000

So, 100,000 is 103,978 rounded to the nearest ten thousand.

## Try It

9) Round 206,981 to the nearest:

- a. hundred
- b. thousand
- c. ten thousand.

### Solution

- a. 207,000
- b. 207,000
- c. 210,000

10) Round 784,951 to the nearest:

- a. hundred
- b. thousand
- c. ten thousand.

### Solution

- a. 785,000
- b. 785,000
- c. 780,000

## Identify Multiples and Apply Divisibility Tests

The numbers 2, 4, 6, 8, 10, and 12 are called multiples of 2. A multiple of 2 can be written as the product of a counting number and 2.

2	$2 \cdot 1$
4	$2 \cdot 2$
6	$2 \cdot 3$
8	$2 \cdot 4$
10	$2 \cdot 5$
12	$2 \cdot 6$

Similarly, a multiple of 3 would be the product of a counting number and 3.

3	$3 \cdot 1$
6	$3 \cdot 2$
9	$3 \cdot 3$
12	$3 \cdot 4$
15	$3 \cdot 5$
18	$3 \cdot 6$

We could find the multiples of any number by continuing this process.

Table. 1.1 shows the multiples of 2 through 9 for the first 12 counting numbers.

Table 1.1

Counting Number	1	2	3	4	5	6	7	8	9	10	11	12
Multiples of 2	2	4	6	8	10	12	14	16	18	20	22	24
Multiples of 3	3	6	9	12	15	18	21	24	27	30	33	36
Multiples of 4	4	8	12	16	20	24	28	32	36	40	44	48
Multiples of 5	5	10	15	20	25	30	35	40	45	50	55	60
Multiples of 6	6	12	18	24	30	36	42	48	54	60	66	72
Multiples of 7	7	14	21	28	35	42	49	56	63	70	77	84
Multiples of 8	8	16	24	32	40	48	56	64	72	80	88	96
Multiples of 9	9	18	27	36	45	54	63	72	81	90	99	108
Multiples of 10	10	20	30	40	50	60	70	80	90	100	110	120

## Multiple of a Number

A number is a **multiple** of  $n$  if it is the product of a counting number and  $n$ .

Another way to say that 15 is a multiple of 3 is to say that 15 is divisible by 3. That means that when we divide 3 into 15, we get a counting number. In fact,  $15 \div 3$  is 5, so 15 is  $15 \times 3$ .

## Divisible by a Number

If a number  $m$  is a multiple of  $n$ , then  $m$  is **divisible** by  $n$ .

Look at the multiples of 5 in Table 1.1. They all end in 5 or 0. Numbers with last digit of 5 or 0 are divisible by 5. Looking for other patterns in Table 1.1 that shows multiples of the numbers 2 through 9, we can discover the following divisibility tests:

## Divisibility Tests

A number is divisible by:

- 2 if the last digit is 0, 2, 4, 6, or 8.
- 3 if the sum of the digits is divisible by 3.
- 4 if the last two digits are divisible by 4.
- 5 if the last digit is 5 or 0.
- 6 if it is divisible by both 2 and 3.
- 8 if it is divisible by 2 and 4.
- 9 if the sum of the digits is divisible by 9.
- 10 if it ends with 0.

### Example 1.1.6

Is 5,625 divisible by 2? By 3? By 5? By 6? By 10?

**Solution**

**Step 1: Is 5,625 divisible by 2?**

No.

**Step 2: Does it end in 0,2,4,6, or 8?**

5,625 is not divisible by 2.

**Step 3: Is 5,625 divisible by 3?**

Yes. 5,625 is divisible by 3.

**Step 4: What is the sum of the digits?**

$$5 + 6 + 2 + 5 = 18$$

**Step 5: Is the sum divisible by 3?**

Yes, 18 is divisible by 3.

**Step 6: Is 5,625 divisible by 5 or 10?**

5,625 is divisible by 5 but not by 10.

**Step 7: What is the last digit?**

It is 5.

**Step 8: Is 5,625 divisible by 6?**

No, it is not.

**Step 9: Is it divisible by both 2 or 3?**

No, 5,625 is not divisible by 2, but it is divisible by 3.

## Try It

11) Determine whether 4,962 is divisible by 2, by 3, by 5, by 6, and by 10.

**Solution**

By 2, 3, and 6.

12) Determine whether 3,765 is divisible by 2, by 3, by 5, by 6, and by 10.

**Solution**

By 3 and 5.

## Find Prime Factorizations and Least Common Multiples

In mathematics, there are often several ways to talk about the same ideas. So far, we've seen that if  $m$  is a multiple of  $n$ , we can say that  $m$  is divisible by  $n$ . For example, since 72 is a multiple of 8, we say 72 is divisible by 8. Since 72 is a multiple of 9, we say 72 is divisible by 9. We can express this still another way.

Since  $8 \times 9 = 72$ , we say that 8 and 9 are **factors** of 72. When we write  $72 = 8 \times 9$ , we say we have factored 72.

$$\underbrace{8 \times 9}_{\text{factors}} = \underbrace{72}_{\text{product}}$$

Other ways to factor 72 are  $1 \cdot 72$ ,  $2 \cdot 36$ ,  $3 \cdot 24$ ,  $4 \cdot 18$ , and  $6 \cdot 12$ . Seventy-two has many factors: 1, 2, 3, 4, 6, 8, 9, 12, 18, 36, and 72.

## Factors

If  $a \cdot b = m$  then  $a$  and  $b$  are factors of  $m$ .

Some numbers, like 72, have many factors. Other numbers have only two factors.

A **prime number** is a counting number greater than 1, whose only factors are 1 and itself.

A **composite number** is a counting number that is not prime. A composite number has factors other than 1 and itself.

The **counting numbers** from 2 to 19 are listed in the below table, with their factors. Make sure to agree with the “prime” or “composite” label for each!

Number	Factors	Prime or Composite
2	1,2	Prime
3	1,3	Prime
4	1,2,4	Composite
5	1,5	Prime
6	1,2,3,6	Composite
7	1,7	Prime
8	1,2,4,8	Composite
9	1,3,9	Composite
10	1,2,5,10	Composite
11	1,11	Prime
12	1,2,3,4,6,12	Composite
13	1,13	Prime
14	1,2,7,14	Composite
15	1,3,5,15	Composite
16	1,2,4,8,16	Composite
17	1,17	Prime
18	1,2,3,6,9,18	Composite
19	1,19	Prime

The prime numbers less than 20 are 2, 3, 5, 7, 11, 13, 17, and 19. Notice that the only even prime number is 2.

A composite number can be written as a unique product of primes. This is called the prime factorization of the number. Finding the **prime factorization** of a composite number will be useful later in this course.

## Prime Factorization

The prime factorization of a number is the product of prime numbers that equals the number. These prime numbers are called the prime factors.

To find the prime factorization of a composite number, find any two factors of the number and use them to create two branches. If a factor is prime, that branch is complete. Circle that prime!

If the factor is not prime, find two factors of the number and continue the process. Once all the branches have circled primes at the end, the factorization is complete. The composite number can now be written as a product of prime numbers.

### Example 1.1.7

Factor 48.

#### Solution

4 and 8 are not prime. Break them each into two factors.

2 and 3 are prime, so circle them.

**Step 1: Find two factors whose product is the given number. Use these numbers to create two branches.**

$$48 = 2 \times 24 \quad \begin{array}{c} 48 \\ \swarrow \quad \searrow \\ 2 \quad 24 \end{array}$$

**Step 2: If a factor is prime, that branch is complete. Circle the prime.**

2 is prime. Circle the prime.

$$\begin{array}{c} 48 \\ \swarrow \quad \searrow \\ \boxed{2} \quad 24 \end{array}$$

**Step 3: If a factor is not prime, write it as the product of two factors and continue the process.**

24 is not prime break it into 2 more factors. 4 and 6 are not prime. Break them each into two factors.

$$\begin{array}{c} 48 \\ \swarrow \quad \searrow \\ \boxed{2} \quad 24 \\ \quad \swarrow \quad \searrow \\ \quad 4 \quad 6 \end{array}$$

2 and 3 are prime, so circle them.

$$\begin{array}{c} 48 \\ \swarrow \quad \searrow \\ \boxed{2} \quad 24 \\ \quad \swarrow \quad \searrow \\ \quad 4 \quad 6 \\ \quad \swarrow \quad \searrow \quad \swarrow \quad \searrow \\ \quad \boxed{2} \quad \boxed{2} \quad \boxed{2} \quad \boxed{3} \end{array}$$

**Step 4: Write the composite number as the product of all the circled primes.**

$$48 = 2 \times 2 \times 2 \times 2 \times 3$$

---

We say  $2 \cdot 2 \cdot 2 \cdot 2 \cdot 3$  is the prime factorization of 48. We generally write the primes in ascending order. Be sure to multiply the factors to verify your answer!

If we first factored 48 in a different way, for example as  $6 \cdot 8$ , the result would still be the same. Finish the prime factorization and verify this for yourself.

## Try It

13) Find the prime factorization of 80.

**Solution**

$2 \cdot 2 \cdot 2 \cdot 2 \cdot 5$

14) Find the prime factorization of 60.

**Solution**

$2 \cdot 2 \cdot 3 \cdot 5$

## Find the Prime Factorization of a Composite Number.

1. Find two factors whose product is the given number, and use these numbers to create two branches.
2. If a factor is prime, that branch is complete. Circle the prime, like a bud on the tree.
3. If a factor is not prime, write it as the product of two factors and continue the process.
4. Write the composite number as the product of all the circled primes.

### Example 1.1.8

Find the prime factorization of 252.

**Solution**

**Step 1: Find two factors whose product is 252. 12 and 21 are not prime.**

Break 12 and 21 into two more factors. Continue until all primes are factored.

$$252 \left\{ \begin{array}{l} 12 \left\{ \begin{array}{l} 6 \left\{ \begin{array}{l} 3 \\ 2 \end{array} \right. \\ 2 \end{array} \right. \\ 21 \left\{ \begin{array}{l} 3 \\ 7 \end{array} \right. \end{array} \right.$$

**Step 2: Write 252 as the product of all the circled primes.**

$$252 = 2 \cdot 2 \cdot 3 \cdot 3 \cdot 7$$

### Try It

15) Find the prime factorization of 126.

**Solution**

$$2 \cdot 3 \cdot 3 \cdot 7$$

16) Find the prime factorization of 294.

**Solution**

$$2 \cdot 3 \cdot 7 \cdot 7$$

One of the reasons we look at multiples and primes is to use these techniques to find the least common multiple

of two numbers. This will be useful when we add and subtract fractions with different denominators. Two methods are used most often to find the least common multiple and we will look at both of them.

The first method is the Listing Multiples Method. To find the least common multiple of 12 and 18, we list the first few multiples of 12 and 18:

**12:** 12, 24, **36**, 48, 60, **72**, 84, 96, **108**...

**18:** 18, **36**, 54, **72**, 90, **108**...

**Common Multiples:** **36**, **72**, **108**...

**Least Common Multiple:** **36**

Notice that some numbers appear in both lists. They are the *common multiples* of 12 and 18.

We see that the first few common multiples of 12 and 18 are 36, 72, and 108. Since 36 is the smallest of the common multiples, we call it the **least common multiple**. We often use the abbreviation LCM.

## Least Common Multiple

The least common multiple (LCM) of two numbers is the smallest number that is a multiple of both numbers.

The procedure box lists the steps to take to find the LCM using the prime factors method we used above for 12 and 18.

## HOW TO

### Find the Least Common Multiple by Listing Multiples.

1. List several multiples of each number.
2. Look for the smallest number that appears on both lists.
3. This number is the LCM.

### Example 1.1.9

Find the least common multiple of 15 and 20 by listing multiples.

**Solution**

**Step 1: Make lists of the first few multiples of 15 and of 20, and use them to find the least common multiple.**

15: 15, 30, 45, 60, 75, 90, 105, 120

20: 20, 40, 60, 80, 100, 120, 140, 160

**Step 2: Look for the smallest number that appears in both lists.**

The first number to appear on both lists is 60, so 60 is the least common multiple of 15 and 20.

---

Notice that 120 is in both lists, too. It is a common multiple, but it is not the *least* common multiple.

### Try It

17) Find the least common multiple by listing multiples: 9 and 12.

**Solution**

36

18) Find the least common multiple by listing multiples: 18 and 24.

**Solution**

72

Our second method to find the least common multiple of two numbers is to use The Prime Factors Method. Let's find the LCM of 12 and 18 again, this time using their prime factors.

**Example 1.1.10**

Find the Least Common Multiple (LCM) of 12 and 18 using the prime factors method.

**Solution**

*Step 1:* Write each number as a product of primes.

**Step 2:** List the primes of each number. Match primes vertically when possible.

List the primes of 12.

$$12 = 2 \times 2 \times 3$$

List the primes of 18. Line up with the primes of 12 when possible. If not create a new column.

$$18 = 2 \times 3 \times 3$$

**Step 3:** Bring down the number from each column.

$$12 = 2 \times 2 \times 3$$

$$18 = 2 \times \quad 3 \times 3$$

$$LCM = 2 \times 2 \times 3 \times 3$$

**Step 4:** Multiply the factors.

$$LCM = 36$$

Notice that the prime factors of 12 ( $2 \cdot 2 \cdot 3$ ) and the prime factors of 18 ( $2 \cdot 3 \cdot 3$ ) are included in the LCM ( $2 \cdot 2 \cdot 3 \cdot 3$ ). So 36 is the least common multiple of 12 and 18.

By matching up the common primes, each common prime factor is used only once. This way you are sure that 36 is the *least* common multiple.

## Try It

19) Find the LCM using the prime factors method: 9 and 12.

**Solution**

36

20) Find the LCM using the prime factors method: 18 and 24.

**Solution**

72

## HOW TO

### Find the Least Common Multiple Using the Prime Factors Method.

1. Write each number as a product of primes.
2. List the primes of each number. Match primes vertically when possible.
3. Bring down the columns.
4. Multiply the factors.

## Example 1.1.11

Find the Least Common Multiple (LCM) of 24 and 36 using the prime factors method.

**Solution**

**Step 1: Find the primes of 24 and 36.**

Match primes vertically when possible.

**Step 2: Bring down all columns.**

$$24 = 2 \times 2 \times 2 \times 3$$

$$36 = 2 \times 2 \times 3 \times 3$$

**Step 3: Multiply the factors.**

$$LCM = 2 \times 2 \times 2 \times 3 \times 3$$

$$LCM = 72$$

The LCM of 24 and 36 is 72.

## Try It

21) Find the LCM using the prime factors method: 21 and 28.

**Solution**

84

22) Find the LCM using the prime factors method: 24 and 32.

**Solution**

96

## Key Concepts

- **Place Value**

- **Name a Whole Number in Words**

1. Start at the left and name the number in each period, followed by the period name.
2. Put commas in the number to separate the periods.
3. Do not name the ones period.

- **Write a Whole Number Using Digits**

1. Identify the words that indicate periods. (Remember the ones period is never named.)
2. Draw 3 blanks to indicate the number of places needed in each period. Separate the periods by commas.
3. Name the number in each period and place the digits in the correct place value position.

- **Round Whole Numbers**

1. Locate the given place value and mark it with an arrow. All digits to the left of the arrow do not change.
2. Underline the digit to the right of the given place value.
3. Is this digit greater than or equal to 5?
  - Yes—add 1 to the digit in the given place value.
  - No—do *not* change the digit in the given place value.
4. Replace all digits to the right of the given place value with zeros.

- **Divisibility Tests:** A number is divisible by:

- 2 if the last digit is 0, 2, 4, 6, or 8.
- 3 if the sum of the digits is divisible by 3.
- 5 if the last digit is 5 or 0.
- 6 if it is divisible by both 2 and 3.
- 10 if it ends with 0.

- **Find the Prime Factorization of a Composite Number**

1. Find two factors whose product is the given number, and use these numbers to create two branches.
2. If a factor is prime, that branch is complete. Circle the prime, like a bud on the tree.
3. If a factor is not prime, write it as the product of two factors and continue the process.
4. Write the composite number as the product of all the circled primes.

- **Find the Least Common Multiple by Listing Multiples**

1. List several multiples of each number.
2. Look for the smallest number that appears on both lists.
3. This number is the LCM.

- **Find the Least Common Multiple Using the Prime Factors Method**

1. Write each number as a product of primes.
2. List the primes of each number. Match primes vertically when possible.
3. Bring down the columns.
4. Multiply the factors.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=60#h5p-1>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## Glossary

### composite number

A composite number is a counting number that is not prime. A composite number has factors other than 1 and itself.

### counting numbers

The counting numbers are the numbers 1, 2, 3, ...

### divisible by a number

If a number  $m$  is a multiple of  $n$ , then  $m$  is divisible by  $n$ . (If 6 is a multiple of 3, then 6 is divisible by 3.)

### factors

If  $a \times b = m$ , then ( $a$  and  $b$ ) are factors of  $m$ . Since  $3 \times 4 = 12$ , then 3 and 4 are factors of 12.

### least common multiple

The least common multiple of two numbers is the smallest number that is a multiple of both numbers.

### multiple of a number

A number is a multiple of  $n$  if it is the product of a counting number and  $n$ .

### number line

A number line is used to visualize numbers. The numbers on the number line get larger as they go from left to right, and smaller as they go from right to left.

### origin

The origin is the point labelled 0 on a number line.

### prime factorization

The prime factorization of a number is the product of prime numbers that equals the number.

### prime number

A prime number is a counting number greater than 1, whose only factors are 1 and itself.

### **whole numbers**

The whole numbers are the numbers 0, 1, 2, 3, ....

# 1.2 INTRODUCTION TO THE LANGUAGE OF ALGEBRA

## Learning Objectives

By the end of this section, you will be able to:

- Use variables and algebraic symbols
- Simplify expressions using the order of operations
- Evaluate an expression
- Identify and combine like terms
- Translate an English phrase to an algebraic expression

## Use Variables and Algebraic Symbols

Suppose this year Greg is 20 years old and Alex is 23. You know that Alex is 3 years older than Greg. When Greg was 12, Alex was 15. When Greg is 35, Alex will be 38. No matter what Greg's age is, Alex's age will always be 3 years more, right? In the language of algebra, we say that Greg's age and Alex's age are **variables** and the 3 is a **constant**. The ages change ("vary") but the 3 years between them always stays the same ("constant"). Since Greg's age and Alex's age will always differ by 3 years, 3 is the *constant*.

In algebra, we use letters of the alphabet to represent variables. So if we call Greg's age  $g$ , then we could use  $g + 3$  to represent Alex's age.

Greg's age	Alex's age
12	15
20	23
35	38
$g$	$g + 3$

## Variable

A variable is a letter that represents a number whose value may change.

## Constant

A constant is a number whose value always stays the same.

To write algebraically, we need some operation symbols as well as numbers and variables. There are several types of symbols we will be using.

There are four basic arithmetic operations: addition, subtraction, multiplication, and division. We'll list the symbols used to indicate these operations below table. You'll probably recognize some of them.

Operation	Notation	Say:	The result is...
Addition	$a + b$	$a$ plus $b$	the sum of $a$ and $b$
Subtraction	$a - b$	$a$ minus $b$	the difference of $a$ and $b$
Multiplication	$a \times b$	$a$ times $b$	the product of $a$ and $b$
Division	$a \div b$	$a$ divided by $b$	the quotient of $a$ and $b$ , $a$ is called the dividend, and $b$ is called the divisor

We perform these operations on two numbers. When translating from symbolic form to English, or from English to symbolic form, pay attention to the words “of” and “and.”

- The *difference of* 9 and 2 means subtract 9 and 2, in other words, 9 minus 2, which we write symbolically as  $9 - 2$ .
- The *product of* 4 and 8 means multiply 4 and 8, in other words 4 times 8, which we write symbolically as  $4 \times 8$ .

In algebra, the cross symbol,  $\times$ , is not used to show multiplication because that symbol may cause confusion.

Does  $3xy$  mean  $3 \times y$  ('three times  $y$ ') or  $(3 \times x \times y)$  ('three times  $x$  times  $y$ ') To make it clear, use  $\cdot$  or parentheses for multiplication.

When two quantities have the same value, we say they are equal and connect them with an equal sign.

## Equality Symbol

$a = b$  is read "a is equal to b"

The symbol "=" is called the equal sign.

On the number line, the numbers get larger as they go from left to right. The number line can be used to explain the symbols "<" and ">".

## Inequality Symbols

$a < b$  is read "a is less than b".

This means a is to the left of b on the number line.

$a > b$  is read a is greater than b.

This means a is to the right of b on the number line.

The expressions  $a < b$  or  $a > b$  can be read from left to right or right to left, though in English we usually read from left to right (Figure 1.2). In general,  $a < b$  is equivalent to  $a > b$ . For example  $7 < 11$  is equivalent to  $11 > 7$ . And  $a > b$  is equivalent to  $a < b$ . For example  $17 > 4$  is equivalent to  $4 < 17$ .

Figure 1.2

Inequality Symbols	Words
$a \neq b$	$a$ is <i>not equal to</i> $b$
$a < b$	$a$ is <i>less than</i> $b$
$a \leq b$	$a$ is <i>less than or equal to</i> $b$
$a > b$	$a$ is <i>greater than</i> $b$
$a \geq b$	$a$ is <i>greater than or equal to</i> $b$

### Example 1.2.1

Translate from algebra into English:

- a.  $17 < 26$
- b.  $8 \neq 17$
- c.  $12 > (27 \div 3)$
- d.  $y + 7 \leq 19$

#### Solution

- a.  $17 < 26$

17 is less than 26

- b.  $8 \neq 17$

8 is not equal to 17

- c.  $12 > (27 \div 3)$

12 is greater than 27 divided by 3

- d.  $y + 7 \leq 19$

$y$  plus 7 is less than or equal to 19

### Try It

1) Translate from algebra into English:

- a.  $14 \leq 27$
- b.  $19 - 2 \neq 8$

c.  $12 > 4 \div 2$

d.  $x - 7 < 1$

**Solution**

a. 14 is less than or equal to 27

b. 19 minus 2 is not equal to 8

c. 12 is greater than 4 divided by 2

d.  $x$  minus 7 is less than 1

2) Translate from algebra into English:

a.  $19 \geq 15$

b.  $7 = 12 - 5$

c.  $15 \div 3 < 8$

d.  $y + 3 > 6$

**Solution**

a. 19 is greater than or equal to 15

b. 7 is equal to 12 minus 5

c. 15 divided by 3 is less than 8

d.  $y$  plus 3 is greater than 6

Grouping symbols in algebra are much like the commas, colons, and other punctuation marks in English. They help to make clear which expressions are to be kept together and separate from other expressions. We will introduce three types now.

## Grouping Symbols

Parentheses ()

Brackets []

Braces {}

Here are some examples of expressions that include grouping symbols. We will simplify expressions like these later in this section.

$$8(14 - 8)$$

What is the difference in English between a phrase and a sentence? A phrase expresses a single thought that is incomplete by itself, but a sentence makes a complete statement. “Running very fast” is a phrase, but “The football player was running very fast” is a sentence. A sentence has a subject and a verb. In algebra, we have *expressions* and *equations*.

## Expression

An expression is a number, a variable, or a combination of numbers and variables using operation symbols.

An **expression** is like an English phrase. Here are some examples of expressions:

Expression	Words	English Phrase
$3 + 5$	3 plus 5	the sum of three and five
$n - 1$	$n$ minus one	the difference of $n$ and one
$6 \times 7$	6 times 7	the product of six and seven
$\frac{x}{y}$	$x$ divided by $y$	the quotient of $x$ and $y$

Notice that the English phrases do not form a complete sentence because the phrase does not have a verb.

An **equation** is two expressions linked with an equal sign. When you read the words the symbols represent in an equation, you have a complete sentence in English. The equal sign gives the verb.

## Equation

An equation is two expressions connected by an equal sign.

Here are some examples of equations.

Equation	English Sentence
$3 + 5 = 8$	The sum of three and five is equal to eight.
$n - 1 = 14$	$n$ minus one equals fourteen.
$6 \times 7 = 42$	The product of six and seven is equal to forty-two.
$x = 53$	$x$ is equal to fifty-three.
$y + 9 = 2y - 3$	$y$ plus nine is equal to two $y$ minus three.

### Example 1.2.2

1) Determine if each is an expression or an equation:

- a.  $2(x + 3) = 10$
- b.  $4(y - 1) + 1$
- c.  $x \div 25$
- d.  $y + 8 = 40$

#### Solution

- a.  $2(x + 3) = 10$ . This is an equation—two expressions are connected with an equal sign.
- b.  $4(y - 1) + 1$ . This is an expression—no equal sign.

c.  $x \div 25$ . This is an expression—no equal sign.

d.  $y + 8 = 40$ . This is an equation—two expressions are connected with an equal sign.

## Try It

3) Determine if each is an expression or an equation:

a.  $3(x - 7) = 27$

b.  $5(4y - 2) - 7$

### Solution

a. equation

b. expression

4) Determine if each is an expression or an equation:

a.  $y^3 \div 14$

b.  $4x - 6 = 22$

### Solution

a. expression

b. equation

Suppose we need to multiply 2 nine times. We could write this as  $2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2$ . This is tedious and it can be hard to keep track of all those 2s, so we use exponents. We write  $2 \times 2 \times 2$  as  $2^3$  and  $2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2 \times 2$  as  $2^9$ . In expressions such as  $2^3$  the 2 is called the *base* and the 3 is called the *exponent*. The exponent tells us how many times we need to multiply the base.

$$\text{base} \leftarrow 2^3 \rightarrow \text{exponent}$$

means multiply 2 by itself, three times, as in  $2 \times 2 \times 2$

We read  $2^3$  as “two to the third power” or “two cubed.”

We say  $2^3$  is in *exponential notation* and  $2 \times 2 \times 2$  is in *expanded notation*.

## Exponential Notation

$a^n$  means multiply  $a$  by itself,  $n$  times.

$base \leftarrow a^{n \rightarrow \text{exponent}}$

$$a^n = a \times a \times \underbrace{a \times \dots \times a}_{n \text{ factors}}$$

The expression  $a^n$  is read  $a$  to the  $n$ th power.

While we read  $a^n$  as “ $a$  to the  $n$ th power,” we usually read:

- $a^2$  “ $a$  squared”
- $a^3$  “ $a$  cubed”

We’ll see later why  $a^2$  and  $a^3$  have special names.

The table below shows how we read some expressions with exponents.

Expression	In Words
$7^2$	7 to the second power or 7 squared
$5^3$	5 to the third power or 5 cubed
$9^4$	9 to the fourth power
$12^5$	12 to the fifth power

### Example 1.2.3

Simplify:  $3^4$

**Solution**

**Step 1: Expand the expression.**

$$3^4 = 3 \times 3 \times 3 \times 3$$

**Step 2: Multiply left to right.**

$$9 \times 3 \times 3$$

**Step 3: Multiply.**

$$27 \times 3$$

**Step 4: Multiply.**

$$81$$

### Try It

5) Simplify

a.  $5^3$

b.  $1^7$

**Solution**

a. 125

b. 1

6) Simplify:

a.  $7^2$

b.  $0^5$

**Solution**

a. 49

b. 0

## Simplify Expressions Using the Order of Operations

To **simplify an expression** means to do all the math possible. For example, to simplify  $4 \times 2 + 1$  we'd first multiply  $4 \times 2$  to get 8 and then add the 1 to get 9. A good habit to develop is to work down the page, writing each step of the process below the previous step. The example just described would look like this:

$$\begin{array}{r} 4 \times 2 + 1 \\ 8 + 1 \\ = 9 \end{array}$$

By not using an equal sign when you simplify an expression, you may avoid confusing expressions with equation.

## Simplify an Expression

To simplify an expression, do all operations in the expression.

We've introduced most of the symbols and notation used in algebra, but now we need to clarify the order of operations. Otherwise, expressions may have different meanings, and they may result in different values. For example, consider the expression:

$$4 + 3 \times 7$$

If you simplify this expression, what do you get?

---

**Some students say 49,**

$$4 + 3 \times 7$$

since  $4 + 3$  gives 7.  $7 \times 7$

$7 \times 7$  is 49 **49**

**Others say 25,**

$$4 + 3 \times 7$$

Since  $3 \times 7$  is 21.  $4 + 21$

And  $21 + 4$  makes 25. **25**

---

Imagine the confusion in our banking system if every problem had several different correct answers!

The same expression should give the same result. So mathematicians early on established some guidelines that are called the Order of Operations.

## HOW TO

### Perform the Order of Operations.

1. Parentheses and Other Grouping Symbols
  - Simplify all expressions inside the parentheses or other grouping symbols, working on the innermost parentheses first.
2. Exponents
  - Simplify all expressions with exponents.
3. Multiplication and Division
  - Perform all multiplication and division in order from left to right. These operations have equal priority.
4. Addition and Subtraction
  - Perform all addition and subtraction in order from left to right. These operations have equal priority.

Doing the [Manipulative Mathematics](#) activity “Game of 24” gives you practice using the order of operations.

Students often ask, “How will I remember the order?” Here is a way to help you remember: Take the first letter of each keyword and substitute the silly phrase: “Please Excuse My Dear Aunt Sally.”

Keyword	Mnemonic
Parentheses	Please
Exponents	Excuse
Multiplication Division	My Dear
Addition Subtraction	Aunt Sally

It’s good that “**My Dear**” goes together, as this reminds us that **m**ultiplication and **d**ivision have equal priority. We do not always do multiplication before division or always do division before multiplication. We do them in order from left to right.

Similarly, “**Aunt Sally**” goes together and so reminds us that **a**ddition and **s**ubtraction also have equal priority and we do them in order from left to right.

Let’s try an example.

### Example 1.2.4

Simplify:

a.  $4 + 3 \times 7$

b.  $(4 + 3) \times 7$

#### Solution

a.

**Step 1: Are there any parentheses?**

No.

**Step 2: Are there any exponents?**

No.

**Step 3: Is there any multiplication or division?**

Yes.

**Step 4: Multiply first.**

$$4 + 3 \times 7$$

**Step 5: Add.**

$$4 + 21 = 25$$

---

b.

**Step 1: Are there any parentheses?**

Yes.

$$(4 + 3) \times 7$$

**Step 2: Simplify inside the parentheses.**

$$(7) \times 7$$

**Step 3: Are there any exponents?**

No.

**Step 4: Is there any multiplication or division?**

Yes.

**Step 5: Multiply.**

$$49$$

## Try It

7) Simplify:

a.  $12 - 5 \times 2$

b.  $(12 - 5) \times 2$

**Solution**

- a. 2
- b. 14

8) Simplify:

- a.  $8 + 3 \times 9$
- b.  $(8 + 3) \times 9$

### Solution

- a. 35
- b. 99

## Example 1.2.5

Simplify:  $18 \div 6 + 4(5 - 2)$

### Solution

#### Step 1: Parentheses?

Yes, subtract first.

$$\begin{aligned} 18 \div 6 + 4(5 - 2) \\ 18 \div 6 + 4(3) \end{aligned}$$

#### Step 2: Exponents?

No.

#### Step 3: Multiplication or division?

Yes.

#### Step 4: Divide first because we multiply and divide left to right.

$$18 \div 6 + 4(3)$$

#### Step 5: Any other multiplication or division?

Yes.

#### Step 6: Multiply.

$$3 + 4(3)$$

**Step 7: Any other multiplication or division?**

No.

**Step 8: Any addition or subtraction?**

Yes, add.

$$3 + 12 = 15$$

## Try It

9) Simplify:  $30 \div 5 + 10(3 - 2)$

**Solution**

16

10) Simplify:  $70 \div 10 + 4(6 - 2)$

**Solution**

23

When there are multiple grouping symbols, we simplify the innermost parentheses first and work outward.

## Example 1.2.6

Simplify:  $5 + 2^3 + 3[6 - 3(4 - 2)]$

**Solution**

**Step 1: Are there any parentheses (or other grouping symbol)?**

Yes.

**Step 2: Focus on the parentheses that are inside the brackets.**

$$5 + 2^3 + 3[6 - 3(4 - 2)]$$

**Step 3: Subtract.**

$$5 + 2^3 + 3[6 - 3(2)]$$

**Step 4: Continue inside the brackets and multiply.**

$$5 + 2^3 + 3[6 - 6]$$

**Step 5: Continue inside the brackets and subtract.**

The expression inside the brackets requires no further simplification.

$$5 + 2^3 + 3[0]$$

**Step 6: Are there any exponents?**

Yes.

**Step 7: Simplify exponents.**

$$5 + (8) + 3[0]$$

**Step 8: Is there any multiplication or division?**

Yes, multiply.

$$5 + 8 + (3 \times 0 = 0)$$

**Step 9: Is there any addition or subtraction?**

Yes, add.

$$5 + 8 + 0 = 13$$

## Try It

11) Simplify:  $9 + 5^3 - [4(9 + 3)]$

**Solution**

86

12) Simplify:  $7^2 - 2[4(5 + 1)]$ **Solution**

1

## Evaluate an Expression

In the last few examples, we simplified expressions using the order of operations. Now we'll evaluate some expressions—again following the order of operations. To **evaluate an expression** means to find the value of the expression when the variable is replaced by a given number.

**To evaluate an expression means to find the value of the expression when the variable is replaced by a given number.**

**To evaluate an expression, substitute that number for the variable in the expression and then simplify the expression.**

### Example 1.2.7

Evaluate  $7x - 4$ , when

- a.  $x = 5$  and,
- b.  $x = 1$

**Solution**

a.

**Step 1: Substitute 5 for  $x$  in the expression.**

Simplify the expression.

$$7 \times 5 - 4$$

**Step 2: Multiply.**

$$35 - 4$$

**Step 3: Subtract.**

$$31$$

---

b.

**Step 1: Substitute 1 for  $x$  in the expression.**

Simplify the expression.

$$7 \times 1 - 4$$

**Step 2: Multiply.**

$$7 - 4$$

**Step 3: Subtract.**

$$3$$

## Try It

13) Evaluate  $8x - 3$ , when

- a.  $x = 2$
- b.  $x = 1$

**Solution**

- a. 13
- b. 5

14) Evaluate  $4y - 4$ , when

- a.  $y = 3$
- b.  $y = 5$

**Solution**

- a. 8
- b. 16

### Example 1.2.8

Evaluate  $x = 4$ , when

- a.  $x^2$
- b.  $3^x$

#### Solution

a.

**Step 1: Replace  $x$  with 4.**

$$4^2$$

**Step 2: Use definition of exponent.**

$$4 \times 4$$

**Step 3: Simplify.**

$$16$$

---

b.

**Step 1: Replace  $x$  with 4.**

$$3^4$$

**Step 2: Use definition of exponent.**

$$3 \times 3 \times 3 \times 3$$

**Step 3: Simplify.**

$$81$$

## Try It

15) Evaluate

- a.  $x^2$
- b.  $4^x$

when  $x = 3$

**Solution**

- a. 9
- b. 64

16) Evaluate

- a.  $x^3$
- b.  $2^x$

when  $x = 6$

**Solution**

- a. 216
- b. 64

## Example 1.2.9

Evaluate  $2x^2 + 3x + 8$  when  $x = 4$

**Solution**

**Step 1: Substitute**  $x = 4$ .

$$2(4)^2 + 3(4) + 8$$

**Step 2: Follow the order of operations.**

$$\begin{aligned} 2(16) + 12 + 8 \\ 32 + 12 + 8 = 52 \end{aligned}$$

## Try It

17) Evaluate  $3x^2 + 4x + 1$  when  $x = 3$

**Solution**

40

18) Evaluate  $6x^2 - 4x - 7$  when  $x = 2$

**Solution**

9

## Identify and Combine Like Terms

### Term

Algebraic expressions are made up of terms. A term is a constant or the product of a constant and one or more variables.

Examples of terms are  $7$ ,  $y$ ,  $5x^2$ ,  $9a$ ,  $b^5$

The constant that multiplies the variable is called the **coefficient**.

## Coefficient

The coefficient of a term is the constant that multiplies the variable in a term.

Think of the coefficient as the number in front of the variable. The coefficient of the term  $3x$  is 3. When we write  $x$ , the coefficient is 1, since  $x = 1x$ .

### Example 1.2.10

Identify the coefficient of each term:

- a.  $14y$
- b.  $15x^2$
- c.  $a$

#### Solution

1. The **coefficient** of  $14y$  is 14.
2. The **coefficient** of  $15x^2$  is 15.
3. The **coefficient** of  $a$  is 1 since  $a = 1a$

## Try It

19) Identify the coefficient of each term:

- a.  $17x$
- b.  $41b^2$
- c.  $z$

**Solution**

- a. 14
- b. 41
- c. 1

20) Identify the coefficient of each term:

- a.  $9p$
- b.  $13a^3$
- c.  $y^3$

**Solution**

- a. 9
- b. 13
- c. 1

Some terms share common traits. Look at the following 6 terms. Which ones seem to have traits in common?

$$5x \quad 7 \quad n^2 \quad 4 \quad 3x \quad 9n^2$$

The **7** and the **4** are both **constant** terms.

The  **$5x$**  and the  **$3x$**  are both terms with  $x$ .

The  **$n^2$**  and the  **$9n^2$**  are both terms with  $n^2$

When two terms are constants or have the same variable and exponent, we say they are **like terms**.

- **7** and **4** are like terms.
- **$5x$**  and  **$3x$**  are like terms.
- **$x^2$**  and  **$9x^2$**  are like terms.

## Like Terms

Terms that are either constants or have the same variables raised to the same powers are called like terms.

### Example 1.2.11

Identify the like terms:  $y^3$ ,  $7x^2$ , 14, 23,  $4y^3$ ,  $9x$ ,  $5x^2$

#### Solution

$y^3$  and  $4y^3$  are like terms because both have  $y^3$  the variable and the exponent match.

$7x^2$  and  $5x^2$  are like terms because both have  $x^2$  the variable and the exponent match.

14 and 23 are like terms because both are constants.

There is no other term like  $9x$

## Try It

21) Identify the like terms: 9,  $2x^3$ ,  $y^2$ ,  $8x^3$ , 15,  $9y$ ,  $11y^2$

#### Solution

9 and 15,  $y^2$  and  $11y^2$ ,  $2x^3$  and  $8x^3$

22) Identify the like terms:  $4x^3$ ,  $8x^2$ , 19,  $3x^2$ , 24,  $6x^3$

**Solution**

19 and 24,  $8x^2$  and  $3x^2$ ,  $4x^3$  and  $6x^3$

Adding or subtracting terms forms an expression. In the expression  $2x^2 + 3x + 8$  when  $x = 4$  from Example 1.2.9, the three terms are  $2x^2$ ,  $3x$ , and 8.

### Example 1.2.12

Identify the terms in each expression.

- a.  $9x^2 + 7x + 12$
- b.  $8x + 3y$

**Solution**

- a. The terms of  $9x^2 + 7x + 12$  are  $9x^2$ ,  $7x$ , and 12.
- b. The terms of  $8x + 3y$  are  $8x$  and  $3y$

### Try It

23) Identify the terms in the expression  $4x^2 + 5x + 17$

**Solution**

$4x^2$ ,  $5x$ , 17

24) Identify the terms in the expression  $5x + 2y$

## Try It

25) Simplify:  $3x^2 + 7x + 9 + 7x^2 + 9x + 8$

**Solution**

$$10x^2 + 16x + 17$$

26) Simplify:  $4y^2 + 5y + 2 + 8y^2 + 4y + 5$

**Solution**

$$12y^2 + 9y + 7$$

## HOW TO

### Combine Like Terms.

1. Identify like terms.
2. Rearrange the expression so like terms are together.
3. Add or subtract the coefficients and keep the same variable for each group of like terms.

## Translate an English Phrase to an Algebraic Expression

In the last section, we listed many operation symbols that are used in algebra, then we translated expressions and equations into English phrases and sentences. Now we'll reverse the process. We'll translate English phrases into algebraic expressions. The symbols and variables we've talked about will help us do that. Below table summarizes them.

Operation	Phrase	Expression
Addition	$a$ plus $b$	$a + b$
	the sum of $a$ and $b$	
	$a$ increased by $b$	
	$b$ more than $a$	
	the total of $a$ and $b$	
	$b$ added to $a$	
Subtraction	$a$ minus $b$	$a - b$
	the difference of $a$ and $b$	
	$a$ decreased by $b$	
	$b$ less than $a$	
	$b$ subtracted from $a$	
Multiplication	$a$ times $b$	$a \times b, ab, a(b), (a)(b), 2a$
	the product of $a$ and $b$	
	twice $a$	
Division	$a$ divided by $b$	$a \div b, \frac{a}{b}, b)\overline{a}$
	the quotient of $a$ and $b$	
	the ratio of $a$ and $b$	
	$b$ divided into $a$	

Look closely at these phrases using the four operations:

the sum *of  $a$  and  $b$*   
the difference *of  $a$  and  $b$*   
the product *of  $a$  and  $b$*   
the quotient *of  $a$  and  $b$*

Each phrase tells us to operate on two numbers. Look for the words *of*, *and* to find the numbers.

### Example 1.2.14

Translate each English phrase into an algebraic expression:

- a. the difference of  $17x$  and 5
- b. the quotient of  $10x^2$  and 7

**Solution**

a.

**Step 1: The key word is “difference”, which tells us the operation is subtraction.**The *difference* of  $17x$  and 5.**Step 2: Look for the words *of* and *and* find the numbers to subtract.**The difference *of*  $17x$  and 5.**Step 3: Find the difference of  $17x$  and 5**

$$17x - 5$$

---

b.

**Step 1: The key word is “quotient,” which tells us the operation is division.**The *quotient* of  $10x^2$  and 7.**Step 2: Divide  $10x^2$  by 7**

$$10x^2 \div 7$$

This can also be written  $10x^2 / 7$  or  $\frac{10x^2}{7}$ .**Try It**

27) Translate the English phrase into an algebraic expression:

- a. the difference of  $14x^2$  and 13

- b. the quotient of  $12x$  and  $2$

**Solution**

- a.  $14x^2 - 13$   
b.  $12x \div 2$

28) Translate the English phrase into an algebraic expression:

- a. the sum of  $17y^2$  and  $19$   
b. the product of  $7$  and  $y$

**Solution**

- a.  $17y^2 + 19$   
b.  $7y$

How old will you be in eight years? What age is eight more years than your age now? Did you add 8 to your present age? Eight “more than” means 8 added to your present age. How old were you seven years ago? This is 7 years less than your age now. You subtract 7 from your present age. Seven “less than” means 7 subtracted from your present age.

### Example 1.2.15

Translate the English phrase into an algebraic expression:

- a. Seventeen more than  $y$   
b. Nine less than  $9x^2$

**Solution**

a.

**Step 1: The key words are *more than*.**

They tell us the operation is addition. *More than* means “added to.”

**Step 2: Seventeen more than  $y$ .**

**Step 3: Seventeen added to  $y$ .**

$$y + 17$$

---

b.

**Step 1: The key words are *less than*.**

They tell us to subtract. *Less than* means “subtracted from.”

**Step 2: Nine less than  $9x^2$**

**Step 3: Nine subtracted from  $9x^2$**

$$9x^2 - 9$$

## Try It

29) Translate the English phrase into an algebraic expression:

- a. Eleven more than  $x$
- b. Fourteen less than  $11a$

### Solution

- a.  $x + 11$
- b.  $11a - 14$

30) Translate the English phrase into an algebraic expression:

- a.  $13$  more than  $z$

- b. 18 less than  $8x$

**Solution**

- a.  $z + 13$   
b.  $8x - 18$

### Example 1.2.16

Translate the English phrase into an algebraic expression:

- a. five times the sum of  $m$  and  $n$   
b. the sum of five times  $m$  and  $n$

**Solution**

a.

**Step 1:** There are two operation words—*times* tells us to multiply and *sum* tells us to add.

**Step 2:** Because we are multiplying 5 times the sum we need parentheses around the sum of  $m$  and  $n$ ,  $(m + n)$ .

This forces us to determine the sum first. (Remember the order of operations.)

**Step 3:** Five times the sum of  $m$  and  $n$ .

$$5(m + n)$$

---

b.

**Step 1:** To take a sum, we look for the words “of” and “and” to see what is being added.

Here we are taking the sum of five times  $m$  and  $n$ .

**Step 2:** The sum of five times  $m$  and  $n$ .

$$5m + n$$

## Try It

31) Translate the English phrase into an algebraic expression:

- a. four times the sum of  $p$  and  $q$
- b. the sum of four times  $p$  and  $q$

### Solution

- a.  $4(p + q)$
- b.  $4p + q$

32) Translate the English phrase into an algebraic expression:

- a. the difference of two times  $x$  and 8
- b. two times the difference of  $x$  and 8

### Solution

- a.  $2x - 8$
- b.  $2(x - 8)$

Later in this course, we'll apply our skills in algebra to solving applications. The first step will be to translate an English phrase to an algebraic expression. We'll see how to do this in the next two examples.

**Example 1.2.17**

The length of a rectangle is 6 less than the width. Let  $w$  represent the width of the rectangle. Write an expression for the length of the rectangle.

**Solution**

**Step 1: Write a phrase about the length of the rectangle.**

6 less than the width

**Step 2: Substitute  $w$  for “the width.”**

6 less than  $w$

**Step 3: Rewrite “less than” as “subtracted from.”**

6 subtracted from  $w$

**Step 4: Translate the phrase into algebra.**

$$w - 6$$

**Try It**

33) The length of a rectangle is 7 less than the width. Let  $w$  represent the width of the rectangle. Write an expression for the length of the rectangle.

**Solution**

$$w - 7$$

34) The width of a rectangle is 6 less than the length. Let  $l$  represent the length of the rectangle. Write an expression for the width of the rectangle.

**Solution**

$$l - 6$$

### Example 1.2.18

June has dimes and quarters in her purse. The number of dimes is three less than four times the number of quarters. Let  $q$  represent the number of quarters. Write an expression for the number of dimes.

#### Solution

**Step 1: Write a phrase about the number of dimes.**

three less than four times the number of quarters

**Step 2: Substitute  $q$  for the number of quarters.**

3 less than 4 times  $q$

**Step 3: Translate “4 times  $q$ ”.**

3 less than  $4q$

**Step 4: Translate the phrase into algebra.**

$$4q - 3$$

### Try It

35) Geoffrey has dimes and quarters in his pocket. The number of dimes is eight less than four

times the number of quarters. Let  $q$  represent the number of quarters. Write an expression for the number of dimes.

**Solution**

$$4q - 8$$

36) Lauren has dimes and nickels in her purse. The number of dimes is three more than seven times the number of nickels. Let  $n$  represent the number of nickels. Write an expression for the number of dimes.

**Solution**

$$7n + 3$$

## Key Concepts

### • Notation

Notation	The result is...
$a + b$	the sum of $a$ and $b$
$a - b$	the difference of $a$ and $b$
$ab, a \times b, (a)(b), (a)b, a(b)$	the product of $a$ and $b$
$a/b, a \div b, \frac{a}{b}, \bar{b}a$	the quotient of $a$ and $b$

### • Inequality

$a < b$ is read “a is less than b”	$a$ is to the left of $b$ on the number line
$a > b$ is read “a is greater than b”	$a$ is to the right of $b$ on the number line

### • Inequality Symbols      Words

---

$a \neq b$   $a$  is not equal to  $b$

$a < b$   $a$  is less than  $b$

$a \leq b$   $a$  is less than or equal to  $b$

$a > b$   $a$  is greater than  $b$

$a \geq b$   $a$  is greater than or equal to  $b$

---

### • Grouping Symbols

- Parentheses ()
- Brackets []
- Braces {}

### • Exponential Notation

- $a^n$  means multiply  $a$  by itself,  $n$  times. The expression  $a^n$  is read  $a$  to the  $n^{\text{th}}$  power.

### • Order of Operations: When simplifying mathematical expressions perform the operations in the following order:

1. Parentheses and other Grouping Symbols: Simplify all expressions inside the parentheses or other grouping symbols, working on the innermost parentheses first.
2. Exponents: Simplify all expressions with exponents.
3. Multiplication and Division: Perform all multiplication and division in order from left to right. These operations have equal priority.
4. Addition and Subtraction: Perform all addition and subtraction in order from left to right. These operations have equal priority.

### • Combine Like Terms

1. Identify like terms.
2. Rearrange the expression so like terms are together.
3. Add or subtract the coefficients and keep the same variable for each group of like terms.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=111#h5p-2>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## Glossary

### **coefficient**

The coefficient of a term is the constant that multiplies the variable in a term.

### **constant**

A constant is a number whose value always stays the same.

### **equality symbol**

The symbol “=” is called the equal sign. We read  $a = b$  as “a is equal to b.”

### **equation**

An equation is two expressions connected by an equal sign.

### **evaluate an expression**

To evaluate an expression means to find the value of the expression when the variable is replaced by a given number.

### **expression**

An expression is a number, a variable, or a combination of numbers and variables using operation symbols.

**like terms**

Terms that are either constants or have the same variables raised to the same powers are called like terms.

**simplify an expression**

To simplify an expression, do all operations in the expression.

**term**

A term is a constant or the product of a constant and one or more variables.

**variable**

A variable is a letter that represents a number whose value may change.

## 1.3 INTEGERS

### Learning Objectives

By the end of this section, you will be able to:

- Use negatives and opposites
- Simplify: expressions with absolute value
- Add integers
- Subtract integers
- Multiply integers
- Divide integers
- Simplify expressions with integers
- Evaluate variable expressions with integers
- Translate English phrases to algebraic expressions
- Use integers in applications

### Use Negatives and Opposites

Our work so far has only included the counting numbers and the whole numbers. But if you have ever experienced a temperature below zero or accidentally overdrawn your checking account, you are already familiar with negative numbers. Negative numbers are numbers less than 0. The negative numbers are to the left of zero on the number line.

The number line shows the location of positive and negative numbers.

The arrows on the ends of the number line indicate that the numbers keep going forever. There is no biggest positive number, and there is no smallest negative number.

Is zero a positive or a negative number? Numbers larger than zero are positive, and numbers smaller than zero are negative. Zero is neither positive nor negative.

Consider how numbers are ordered on the number line. Going from left to right, the numbers increase in value. Going from right to left, the numbers decrease in value.

The numbers on a number line increase in value going from left to right and decrease in value going from right to left.

Remember that we use the notation:

$a < b$  (read “a is less than b”) when  $a$  is to the left of  $b$  on the number line.

$a > b$  (read “a is greater than b”) when  $a$  is to the right of  $b$  on the number line.

Now we need to extend the number line which showed the whole numbers to include negative numbers, too. The numbers marked by points in figure 1.3.1 are called the integers. The integers are the numbers  $\{\dots\}-3,-2,-1,0,1,2,3\{\dots\}$

All the marked numbers are called *integers*.

Figure 1.3.1

### Example 1.3.1

Order each of the following pairs of numbers, using  $<$  or  $>$ :

- $14$  \_\_\_  $6$
- $-1$  \_\_\_  $9$
- $-1$  \_\_\_  $-4$
- $2$  \_\_\_  $-20$

Figure 1.3.2

**Solution**

It may be helpful to refer to the number line shown.

a. 14 is to the right of 6 on the number line.

$$14 \underline{\hspace{1cm}} 6 \quad 14 > 6$$

b. -1 is to the left of 9 on the number line.

$$-1 \underline{\hspace{1cm}} 9 \quad -1 < 9$$

c. -1 is to the right of -4 on the number line.

$$-1 \underline{\hspace{1cm}} -4 \quad -1 > -4$$

d. 2 is to the right of -20 on the number line.

$$2 \underline{\hspace{1cm}} -20 \quad 2 > -20$$

**Try It**

1) Order each of the following pairs of numbers, using  $<$  or  $>$ :

a.  $15 \underline{\hspace{1cm}} 7$

b.  $-2 \underline{\hspace{1cm}} 5$

c.  $-3 \underline{\hspace{1cm}} -7$

d.  $5 \underline{\hspace{1cm}} -17$

**Solution**

- a. >
- b. <
- c. >
- d. >

2) Order each of the following pairs of numbers, using < or >:

- a.  $8 \underline{\hspace{1cm}} 13$
- b.  $3 \underline{\hspace{1cm}} -4$
- c.  $-5 \underline{\hspace{1cm}} -2$
- d.  $9 \underline{\hspace{1cm}} -21$

### Solution

- a. <
- b. >
- c. <
- d. >

You may have noticed that, on the number line, the negative numbers are a mirror image of the positive numbers, with zero in the middle. Because the numbers 2 and  $-2$  are the same distance from zero, they are called **opposites**. The opposite of 2 is  $-2$  and the opposite of  $-2$  is 2.

## Opposite

The opposite of a number is the number that is the same distance from zero on the number line but on the opposite side of zero.

Figure 1.3.3 illustrates the definition.

The opposite of 3 is  $-3$ .

Figure 1.3.3

Sometimes in algebra, the same symbol has different meanings. Just like some words in English, the specific meaning becomes clear by looking at how it is used. You have seen the symbol “ $-$ ” used in three different ways.

---

$10 - 4$	Between two numbers, it indicates the operation of subtraction. We read $10 - 4$ as “10 minus 4.”
$-8$	In front of a number, it indicates a negative number. We read $-8$ as “negative eight.”
$-x$	In front of a variable, it indicates the opposite. We read $-x$ as “the opposite of $x$ .”
$-(-2)$	Here there are two “ $-$ ” signs. The one in the parentheses tells us the number is negative 2, and the one outside the parentheses tells us to take the opposite of $-2$ . We read $-(-2)$ as “the opposite of negative two.”

---

## Opposite Notation

$-a$  means the opposite of the number  $a$ .

The notation  $-a$  is read as “the opposite of  $a$ .”

### Example 1.3.2

Find:

- a. the opposite of **7**
- b. the opposite of **−10**
- c. the opposite of **−6**

**Solution**

a. **−7** is the same distance from **0** as **7**, but on the opposite side of **0**

The opposite of **7** is **−7**.

---

b. **10** is the same distance from **0** as **−10**, but on the opposite side of **0**.

The opposite of **−10** is **10**.

---

c. **−(−6)**

The opposite of **−(−6)** is **−6**.

**Try It**

3) Find:

- a. the opposite of **4**
- b. the opposite of  **$-3$**
- c.  **$-(-1)$**

**Solution**

- a.  **$-4$**
- b.  **$3$**
- c.  **$1$**

4) Find:

- a. the opposite of **8**
- b. the opposite of  **$-5$**
- c.  **$-(-5)$**

**Solution**

- a.  **$-8$**
- b.  **$5$**
- c.  **$5$**

Our work with opposites gives us a way to define the integers. The whole numbers and their opposites are called the **integers**. The integers are the numbers  $-3, -2, -1, 0, 1, 2, 3$

## Integers

The whole numbers and their opposites are called the integers.

The integers are the numbers  $-3, -2, -1, 0, 1, 2, 3$

When evaluating the opposite of a variable, we must be very careful. Without knowing whether the variable represents a positive or negative number, we don't know whether  $x$  is positive or negative. We can see this in the below figure.

### Example 1.3.3

Evaluate

- a.  $-x$ , when  $x = 8$
- b.  $-x$ , when  $x = -8$ .

#### Solution

a.

To evaluate when  $x = 8$  means to substitute 8 for  $x$ .

**Step 1: Substitute 8 for  $x$ .**

$$-(8)$$

**Step 2: Write the opposite of 8.**

$$-8$$

---

b.

To evaluate when  $x = -8$  means to substitute  $-8$  for  $x$ .

**Step 1: Substitute  $-8$  for  $x$ .**

$$-(-8)$$

**Step 2: Write the opposite of  $-8$ .**

$$8$$

## Try It

5) Evaluate  $-n$  when

- a.  $n = 4$
- b.  $n = -4$

### Solution

- a.  $-4$
- b.  $4$

6) Evaluate  $-m$  when

- a.  $m = 11$
- b.  $m = -11$

### Solution

- a.  $-11$
- b.  $11$

## Simplify: Expressions with Absolute Value

We saw that numbers such as 2 and  $-2$  are opposites because they are the same distance from 0 on the number line. They are both two units from 0. The distance between 0 and any number on the number line is called the **absolute value** of that number.

## Absolute Value

The absolute value of a number is its distance from 0 on the number line.

The absolute value of a number  $n$  is written as  $|n|$ .

For example,

- $-5$  is 5 units away from 0, so  $|-5| = 5$ .
- $5$  is 5 units away from 0, so  $|5| = 5$ .

The figure below illustrates this idea. The integers 5 and  $-5$  are 5 units away from 0.

The absolute value of a number is never negative (because distance cannot be negative). The only number with absolute value equal to zero is the number zero itself, because the distance from 0 to 0 on the number line is zero units.

## Property of Absolute Value

$|n| \geq 0$  for all numbers

Absolute values are always greater than or equal to zero!

Mathematicians say it more precisely, “absolute values are always non-negative.” Non-negative means greater than or equal to zero.

### Example 1.3.4

7) Simplify:

a.  $|3|$

b.  $|-44|$

c.  $|0|$

#### **Solution**

The absolute value of a number is the distance between the number and zero. Distance is never negative, so the absolute value is never negative.

a.  $|3| = 3$

---

b.  $|-44| = 44$

---

c.  $|0| = 0$

### Try It

7) Simplify:

a.  $|4|$

b.  $|-28|$

c.  $|0|$

**Solution**

- a. 4
- b. 28
- c. 0

8) Simplify:

- a.  $|-13|$
- b.  $|47|$
- c.  $|0|$

**Solution**

- a. 13
- b. 47
- c. 0

In the next example, we'll order expressions with absolute values. Remember, positive numbers are always greater than negative numbers!

**Example 1.3.5**

Fill in  $<$ ,  $>$  or  $=$  for each of the following pairs of numbers:

- 1.  $|-5|$  \_\_\_  $-|-5|$
- 2.  $8$  \_\_\_  $-|-8|$
- 3.  $-9$  \_\_\_  $-|-9|$
- 4.  $-(-16)$  \_\_\_  $-|-16|$

**Solution**

a.

**Step 1: Simplify.**

$$-5 \underline{\hspace{1cm}} - -5$$

**Step 2: Order.**

$$5 > -5$$

$$|5| > -|-5|$$

---

b.

**Step 1: Simplify.**

$$8 \underline{\hspace{1cm}} - -8$$

**Step 2: Order.**

$$8 > -8$$

$$|8| > -|-8|$$

---

c.

**Step 1: Simplify.**

$$-9 \underline{\hspace{1cm}} - -9$$

**Step 2: Order.**

$$-9 = -9$$

$$|9| = -|-9|$$

---

d.

**Step 1: Simplify.**

$$- - 16 \underline{\hspace{1cm}} - 16|$$

**Step 2: Order.**

$$16 > -16$$
$$-(-16) > -|-16|$$

**Try It**

9) Fill in  $<$ ,  $>$ , or  $=$  for each of the following pairs of numbers:

- a.  $|-9|$  \_\_\_\_  $-|-9|$
- b.  $|2|$  \_\_\_\_  $-|-2|$
- c.  $|-8|$  \_\_\_\_  $|-8|$
- d.  $-(-9)$  \_\_\_\_  $-|-9|$

**Solution**

- a.  $>$
- b.  $>$
- c.  $<$
- d.  $>$

10) Fill in  $<$ ,  $>$ , or  $=$  for each of the following pairs of numbers:

- a.  $|7|$  \_\_\_\_  $-|-7|$
- b.  $-(-10)$  \_\_\_\_  $-|-10|$
- c.  $|-4|$  \_\_\_\_  $-|-4|$
- d.  $|-1|$  \_\_\_\_  $|-1|$

**Solution**

- a.  $>$
- b.  $>$

- c. >
- d. <

We now add **absolute value** bars to our list of grouping symbols. When we use the order of operations, first we simplify inside the absolute value bars as much as possible, then we take the absolute value of the resulting number.

## Grouping Symbols

Parentheses ()	Braces {}
Brackets []	Absolute value

In the next example, we simplify the expressions inside **absolute value** bars first, just like we do with parentheses.

### Example 1.3.6

Simplify:  $24 - |19 - 3(6 - 2)|$

#### **Solution**

**Step 1: Work inside parentheses first: subtract 2 from 6.**

$$24 - |19 - 3(4)|$$

**Step 2: Multiply 3(4).**

$$24 - |19 - 12|$$

**Step 3: Subtract inside the absolute value bars.**

$$24 - |7|$$

**Step 4: Take the absolute value.**

$$24 - 7$$

**Step 5: Subtract**

$$17$$

## Try It

11) Simplify:  $19 - |11 - 4(3 - 1)|$

**Solution**

$$16$$

12) Simplify:  $9 - |8 - 4(7 - 5)|$

**Solution**

$$9$$

## Example 1.3.7

Evaluate:

- a.  $|x|$  when  $x = -35$
- b.  $|-y|$  when  $y = -20$

c.  $-|u|$  when  $u = 12$

d.  $-|p|$  when  $p = -14$

**Solution**

a.

**Step 1: Substitute  $-35$  for  $x$ .**

$$|-35|$$

**Step 2: Take the absolute value.**

$$35$$

---

b.

**Step 1: Substitute  $-20$  for  $y$ .**

$$|(-20)|$$

**Step 2: Simplify.**

$$|20|$$

**Step 3: Take the absolute value.**

$$20$$

---

c.

**Step 1: Substitute  $12$  for  $u$ .**

$$-|12|$$

**Step 2: Take the absolute value.**

$$-12$$

---

d.

**Step 1: Substitute  $-14$  for  $p$ .**

$$-|-14|$$

**Step 2: Take the absolute value**

$$-14$$

## Try It

13) Evaluate:

- a.  $|x|$  when  $x = -17$
- b.  $|-y|$  when  $y = 39$
- c.  $-|m|$  when  $m = 22$
- d.  $-|p|$  when  $p = -11$ .

### Solution

- a. 17
- b. 39
- c. -22
- d. -11

14) Evaluate:

- a.  $|y|$  when  $y = -23$
- b.  $|-y|$  when  $y = -21$
- c.  $-|n|$  when  $n = 37$
- d.  $-|q|$  when  $q = -49$

### Solution

- a. 23

- b. 21
- c. -37
- d. -49

## Add Integers

Most students are comfortable with the addition and subtraction facts for positive numbers. But doing addition or subtraction with both positive and negative numbers may be more challenging.

We will use two colour counters to model addition and subtraction of negatives so that you can visualize the procedures instead of memorizing the rules.

We let one colour (blue) represent positive. The other colour (red) will represent the negatives. If we have one positive counter and one negative counter, the value of the pair is zero. They form a neutral pair. The value of this neutral pair is zero.

Figure 1.3.4

We will use the counters to show how to add the four addition facts using the numbers 5, -5 and 3, -3.

$$5 + 3 \quad -5 + (-3) \quad -5 + 3 \quad 5 + (-3)$$

To add  $5 + 3$ , we realize that  $5 + 3$  means the sum of 5 and 3.

We start with 5 positives.

Figure 1.3.5

And then we add 3 positives.

Figure 1.3.6

We now have 8 positives. The sum of 5 and 3 is 8.

Figure 1.3.7

---

Now we will add  $-5 + (-3)$ . Watch for similarities to the last example  $5 + 3 = 8$ .

To add  $-5 + (-3)$ , we realize this means the sum of  $-5$  and  $-3$ .

We start with 5 negatives.

Figure 1.3.8

And then we add 3 negatives.

Figure 1.3.9

We now have 8 negatives. The sum of  $-5$  and  $-3$  is  $-8$ .

Figure 1.3.10

In what ways were these first two examples similar?

- The first example adds 5 positives and 3 positives—both positives.
- The second example adds 5 negatives and 3 negatives—both negatives.

In each case we got 8—either 8 positives or 8 negatives.

When the signs were the same, the counters were all the same colour, and so we added them.

Figure 1.3.11

### Example 1.3.8

Add:

a.  $1 + 4$

b.  $-1 + (-4)$

#### Solution

a.

Figure 1.3.12

1 positive plus 4 positives is 5 positives.

---

b.

Figure 1.3.13

1 negative plus 4 negatives is 5 negatives.

## Try It

15) Add:

a.  $2 + 4$

b.  $-2 + (-4)$

### Solution

a. 6

b. -6

16) Add:

a.  $2 + 5$

b.  $-2 + (-5)$

### Solution

a. 7

b. -7

So what happens when the signs are different? Let's add  $-5+3$ . We realize this means the sum of  $-5$  and  $3$ . When the counters were the same colour, we put them in a row. When the counters are a different colour, we line them up under each other.

$-5 + 3$  means the sum of  $-5$  and  $3$ .

We start with 5 negatives.

Figure 1.3.14

And then we add 3 positives.

Figure 1.3.15

We remove any neutral pairs.

Figure 1.3.16

We have 2 negatives left.

**2 negatives**

Figure 1.3.17

The sum of  $-5$  and  $3$  is  $-2$ .  $-5 + 3 = -2$

Notice that there were more negatives than positives, so the result was negative.

Let's now add the last combination,  $5 + (-3)$ .

$5 + (-3)$  means the sum of 5 and  $-3$ .

We start with 5 positives.

Figure 1.3.18

And then we add 3 negatives.

Figure 1.3.19

We remove any neutral pairs.

Figure 1.3.20

We have 2 positives left.

**2 positives**

Figure 1.3.21

The sum of 5 and  $-3$  is 2.  $5 + (-3) = 2$

When we use counters to model addition of positive and negative integers, it is easy to see whether there are more positive or more negative counters. So we know whether the sum will be positive or negative.

Figure 1.3.22

### Example 1.3.9

Add:

- a.  $-1 + 5$
- b.  $1 + (-5)$

#### Solution

a.

Figure 1.3.23

There are more positives, so the sum is positive.

$$-1 + 5 = 4$$

b.

Figure 1.3.24

There are more negatives, so the sum is negative.

$$1 + (-5) = -4$$

## Try It

17) Add:

- a.  $-2 + 4$
- b.  $2 + (-4)$

### Solution

- a.  $2$
- b.  $-2$

18) Add:

- a.  $-2 + 5$
- b.  $2 + (-5)$

### Solution

- a.  $3$
- b.  $-3$

Now that we have added small positive and negative integers with a model, we can visualize the model in our minds to simplify problems with any numbers.

When you need to add numbers such as  $37 + (-53)$ , you really don't want to have to count out 37 blue counters and 53 red counters. With the model in your mind, can you visualize what you would do to solve the problem?

Picture 37 blue counters with 53 red counters lined up underneath. Since there would be more red (negative) counters than blue (positive) counters, the sum would be *negative*. How many more red counters would there be? Because  $53 - 37 = 16$ , there are 16 more red counters.

Therefore, the sum of  $37 + (-53)$  is  $-16$ .

$$37 + (-53) = -16$$

Let's try another one. We'll add  $-74 + (-27)$ . Again, imagine 74 red counters and 27 more red counters, so we'd have 101 red counters. This means the sum is  $-101$ .

$$-74 + (-27) = -101$$

Let's look again at the results of adding the different combinations of 5,  $-5$  and 3,  $-3$ .

## Addition of Positive and Negative Integers

$5 + 3$	$-5 + (-3)$
8	-8
both positive, sum positive	both negative, sum negative

When the signs are the same, the counters would be all the same colour, so add them.

$-5 + 3$	$5 + (-3)$
-2	2
different signs, more negatives, sum negative	different signs, more positives, sum positive

When the signs are different, some of the counters would make neutral pairs, so subtract to see how many are left.

Visualize the model as you simplify the expressions in the following examples.

### Example 1.3.10

Simplify

a.  $19 + (-47)$

b.  $-14 + (-36)$

#### Solution

a. Since the signs are different, we subtract 19 from 47. The answer will be negative because there are more negatives than positives.

#### Step 1: Subtract

$$\begin{array}{r} 19 + (-47) \\ -28 \end{array}$$

---

b. Since the signs are the same, we add. The answer will be negative because there are only negatives.

#### Step 1: Add

$$\begin{array}{r} -14 + (-36) \\ -50 \end{array}$$

### Try It

19) Simplify:

a.  $-31 + (-19)$

b.  $15 + (-32)$

**Solution**

a.  $-50$

b.  $-17$

20) Simplify:

a.  $-42 + (-28)$

b.  $25 + (-61)$

**Solution**

a.  $-70$

b.  $-36$

The techniques used up to now extend to more complicated problems, like the ones we've seen before. Remember to follow the order of operations!

**Example 1.3.11**Simplify:  $-5 + 3(-2 + 7)$ **Solution****Step 1: Simplify inside the parentheses.**

$$-5 + 3(5)$$

**Step 2: Multiply.**

$$-5 + 15$$

**Step 3: Add left to right.**

10

**Try It**21) Simplify:  $-2 + 5(-4 + 7)$ **Solution**

13

22) Simplify:  $-4 + 2(-3 + 5)$ **Solution**

0

## Subtract Integers

We will continue to use counters to model subtraction. Remember, the blue counters represent positive numbers and the red counters represent negative numbers.

Perhaps when you were younger, you read “ $5-3$ ” as “5 take away 3”. When you use counters, you can think of subtraction the same way!

We will model the four subtraction facts using the numbers 5 and 3.

$$5 - 3 \quad -5 - (-3) \quad -5 - 3 \quad 5 - (-3)$$

To subtract  $5-3$ , we restate the problem as “5 takes away 3”.

We start with 5 positives.

Figure 1.3.25

We 'take away' 3 positives.

Figure 1.3.26

We have 2 positives left.

The difference of 5 and 3 is 2.

Now we will subtract  $-5 - (-3)$ . Watch for similarities to the last example  $5 - 3 = 2$ .

To subtract  $-5 - (-3)$ , we restate this as “-5 take away -3”.

We start with 5 negatives.

Figure 1.3.27

We 'take away' 3 negatives.

Figure 1.3.28

We have 2 negatives left.

The difference of  $-5$  and  $-3$  is  $-2$ .

Notice that these two examples are much alike: The first example, we subtract 3 positives from 5 positives and end up with 2 positives.

In the second example, we subtract 3 negatives from 5 negatives and end up with 2 negatives.

Each example used counters of only one colour, and the “take away” model of subtraction was easy to apply.

Figure 1.3.29

### Example 1.3.12

Subtract:

- a.  $7 - 5$
- b.  $-7 - (-5)$

#### Solution

a.

**Step 1:** Take 5 positive from 7 positives and get 2 positives.

$$7 - 5 = 2$$

---

b.

**Step 1:** Take 5 negatives from 7 negatives and get 2 negatives.

$$-7 - (-5) = -2$$

## Try It

23) Subtract:

- a.  $6 - 4$
- b.  $-6 - (-4)$

### Solution

- a.  $2$
- b.  $-2$

24) Subtract:

- a.  $7 - 4$
- b.  $-7 - (-4)$

### Solution

- a.  $3$
- b.  $-3$

What happens when we have to subtract one positive and one negative number? We'll need to use both white and red counters as well as some neutral pairs. Adding a neutral pair does not change the value. It is like changing quarters to nickels—the value is the same, but it looks different.

- To subtract  $-5 - 3$ , we restate it as  $-5$  take away 3.

We start with 5 negatives. We need to take away 3 positives, but we do not have any positives to take away.

Remember, a neutral pair has value zero. If we add 0 to 5 its value is still 5. We add neutral pairs to the 5 negatives until we get 3 positives to take away.

We start with 5 negatives.

Figure 1.3.30

We now add the neutrals needed to get 3 positives.

Figure 1.3.31

We remove the 3 positives.

Figure 1.3.32

We are left with 8 negatives.

Figure 1.3.33

The difference of  $-5$  and  $3$  is  $-8$ .

$$-5 - 3 = -8$$

And now, the fourth case,  $5 - (-3)$ . We start with 5 positives. We need to take away 3 negatives, but there are no negatives to take away. So we add neutral pairs until we have 3 negatives to take away.

We start with 5 positives.

Figure 1.3.34

We now add the needed neutrals pairs.

Figure 1.3.35

We remove the 3 negatives.

Figure 1.3.36

We are left with 8 positives.

8 positives

Figure 1.3.37

The difference of 5 and  $-3$  is 8.

$$5 - (-3) = 8$$

### Example 1.3.13

Subtract:

- a.  $-3 - 1$   
 b.  $3 - (-1)$ .

**Solution**

a.

**Step 1: Take 1 positive from the one added neutral pair.**

Figure 1.3.38

$$-3 - 1$$

1.3.39

$$-4$$

---

b.

**Step 1: Take 1 negative from the one added neutral pair.**

1.3.40

$$3 - (-1)$$

Figure 1.3.41

$$4$$

## Try It

25) Subtract:

- a.  $-6 - 4$
- b.  $6 - (-4)$

### Solution

- a.  $-10$
- b.  $10$

26) Subtract:

- a.  $-7 - 4$
- b.  $7 - (-4)$

### Solution

- a.  $-11$
- b.  $11$

Have you noticed that *subtraction of signed numbers can be done by adding the opposite*? In example 1.3.13 (above),  $-3 - 1$  is the same as  $-3 + (-1)$  and  $3 - (-1)$  is the same as  $3 + 1$ . You will often see this idea, the subtraction property, written as follows:

## Subtraction Property

$$a - b = a + (-b)$$

Subtracting a number is the same as adding its opposite.

Look at these two examples.

Figure 1.3.42

$6 - 4$  gives the same answer as  $6 + (-4)$ .

Of course, when you have a subtraction problem that has only positive numbers, like  $6 - 4$ , you just do the subtraction. You already knew how to subtract  $6 - 4$  long ago. But *knowing* that  $6 - 4$  gives the same answer as  $6 + (-4)$  helps when you are subtracting negative numbers. Make sure that you understand how  $6 - 4$  and  $6 + (-4)$  give the same results!

### Example 1.3.14

Simplify:

- a.  $13 - 8$  and  $13 + (-8)$
- b.  $-17 - 9$  and  $-17 + (-9)$

#### Solution

a.

**Step 1: Subtract.**

$$13 - 8 = 5$$
$$13 + (-8) = 5$$

---

b.

**Step 1: Subtract.**

$$-17 - 9 = -26$$
$$-17 + (-9) = -26$$

## Try It

27) Simplify:

- a.  $21 - 13$  and  $21 + (-13)$
- b.  $-11 - 7$  and  $-11 + (-7)$ .

**Solution**

- a. 8
- b.  $-18$

28) Simplify:

- a.  $15 - 7$  and  $15 + (-7)$
- b.  $-14 - 8$  and  $-14 + (-8)$ .

**Solution**

- a. 8
- b.  $-22$

Look at what happens when we subtract a negative.

Figure 1.3.43

$8 - (-5)$  gives the same answer as  $8 + 5$

*Subtracting a negative number is like adding a positive!*

You will often see this written as  $a - b = a + b$ .

Does that work for other numbers, too? Let's do the following example and see.

### Example 1.3.15

Simplify:

- a.  $9 - (-15)$  and  $9 + 15$
- b.  $-7 - (-4)$  and  $-7 + 4$

#### Solution

a.

**Step 1: Subtract.**

$$\begin{aligned} 9 - (-15) &= 24 \\ 9 + 15 &= 24 \end{aligned}$$

b.

**Step 1: Subtract.**

$$\begin{aligned}-7 - (-4) &= -3 \\ -7 + 4 &= -3\end{aligned}$$

## Try It

29) Simplify

- a.  $6 - (-13)$  and  $6 + 13$
- b.  $-5 - (-1)$  and  $-5 + 1$

### Solution

- a. 19
- b. -4

30) Simplify:

- a.  $4 - (-19)$  and  $4 + 19$
- b.  $-4 - (-7)$  and  $-4 + 7$

### Solution

- a. 23
- b. 3

Let's look again at the results of subtracting the different combinations of 5, -5 and 3, -3.

## Subtraction of Integers

$$\begin{array}{r} 5 - 3 \\ 2 \\ \hline \end{array}$$

5 positives take 3 positives  
2 positives

$$\begin{array}{r} -5 - (-3) \\ -2 \\ \hline \end{array}$$

5 negatives take away 3 negatives  
2 negatives

When there would be enough counters of the colour to take away, subtract.

$$\begin{array}{r} -5 - 3 \\ -8 \\ \hline \end{array}$$

5 negatives, want to take away 3 positives  
need neutral pairs

$$\begin{array}{r} 5 - (-3) \\ 8 \\ \hline \end{array}$$

5 positives, want to take away 3 negatives  
need neutral pairs

When there would be not enough counters of the colour to take away, add.

What happens when there are more than three integers? We just use the order of operations as usual.

### Example 1.3.16

Simplify:  $7 - (-4 - 3) - 9$

**Solution**

**Step 1: Simplify inside the parentheses first.**

$$7 - (-7) - 9$$

**Step 2: Subtract left to right**

$$14 - 9$$

**Step 3: Subtract**

$$5$$

## Try It

31) Simplify:  $8 - (-3 - 1) - 9$

**Solution**

3

32) Simplify:  $12 - (-9 - 6) - 14$

**Solution**

13

## Multiply Integers

Since multiplication is mathematical shorthand for repeated addition, our model can easily be applied to show multiplication of integers. Let's look at this concrete model to see what patterns we notice. We will use the same examples that we used for addition and subtraction. Here, we will use the model just to help us discover the pattern.

We remember that  $a \times b$  means add  $a$ ,  $b$  times. Here, we are using the model just to help us discover the pattern.

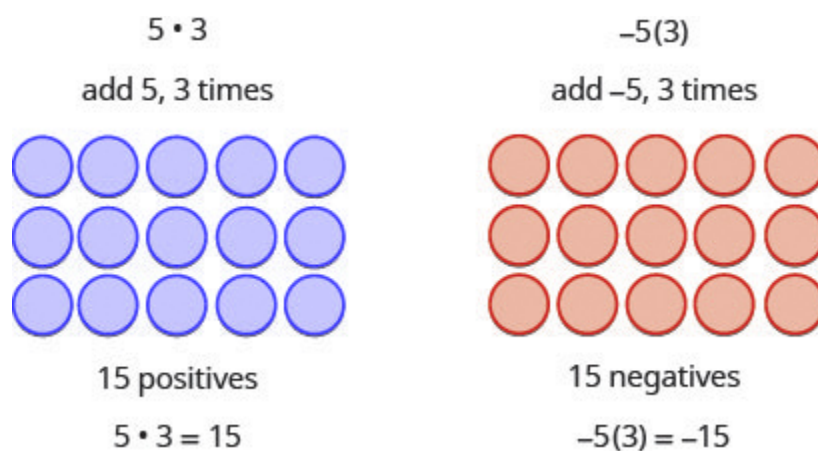

Figure 1.3.44

The next two examples are more interesting.

What does it mean to multiply 5 by  $-3$ ? It means subtract 5, 3 times. Looking at subtraction as “taking away,” it means to take away 5, 3 times. But there is nothing to take away, so we start by adding neutral pairs on the workspace. Then we take away 5 three times.

Figure 1.3.45

**In summary:**

$$5 \times 3 = 15$$

$$-5 \times 3 = -15$$

$$5 \times -3 = -15$$

$$-5 \times -3 = 15$$

Notice that for multiplication of two signed numbers, when the:

- signs are the *same*, the product is *positive*.
- signs are *different*, the product is *negative*.

We'll put this all together in the chart below.

## Multiplication of Signed Numbers

For multiplication of two signed numbers:

Same signs	Product	Example
Two positives	Positive	$7 \times 4 = 28$
Two negatives	Positive	$-8 \times -6 = 48$

If the signs are the same, the result is positive.

Different signs	Product	Example
Positive and negative	Negative	$7 \times -9 = -63$
Negative and positive	Negative	$-5 \times 10 = -50$

If the signs are different, the result is negative.

### Example 1.3.17

a.  $9 \times 3$

b.  $-2(-5)$

c.  $4(-8)$

d.  $7 \times 6$

**Solution**

a.

**Step 1:** Multiply, noting that the signs are different so the product is negative.

$$9 \times 3 = -27$$

---

b.

**Step 1:** Multiply, noting that the signs are the same so the product is positive.

$$-2(-5) = 10$$

---

c.

**Step 1:** Multiply, with different signs.

$$4(-8) = -32$$

---

d.

**Step 1:** Multiply, with same signs.

$$7 \times 6 = 42$$

## Try It

33) Multiply:

- a.  $-6 \times 8$
- b.  $-4(-7)$
- c.  $9(-7)$
- d.  $5 \times 12$

### Solution

- a.  $-48$
- b.  $28$
- c.  $-63$
- d.  $60$

34) Multiply:

- a.  $-8 \times 7$
- b.  $-6(-9)$
- c.  $7(-4)$
- d.  $3 \times 13$

### Solution

- a.  $-56$
- b.  $54$
- c.  $-28$
- d.  $39$

When we multiply a number by 1, the result is the same number. What happens when we multiply a number by  $-1$ . Let's multiply a positive number and then a negative number by  $-1$  to see what we get.

Each time we multiply a number by  $-1$ , we get its opposite!

Multiplication by  $-1$

$$-1a = -a$$

Multiplying a number by  $-1$  gives its opposite.

### Example 1.3.18

Multiply:

a.  $-1 \times 7$

b.  $-1(-11)$

#### Solution

a.

**Step 1:** Multiply, noting that the signs are different so the product is negative.

$$-1 \times 7 = -7$$

$-7$  is the opposite of  $7$ .

---

b.

**Step 1:** Multiply, noting that the signs are the same so the product is positive.

$$-1(-11) = 11$$

$11$  is the opposite of  $-11$ .

### Try It

35) Multiply:

- a.  $-1 \times 9$
- b.  $-1(-17)$

**Solution**

- a.  $-9$
- b.  $17$

36) Multiply:

- a.  $-1 \times 8$
- b.  $-1(-16)$

**Solution**

- a.  $-8$
- b.  $16$

## Divide Integers

What about division? Division is the inverse operation of multiplication. So,  $15 \div 3 = 5$  because  $5 \times 3 = 15$ . In words, this expression says that 15 can be divided into three groups of five each because adding five three times gives 15. Look at some examples of multiplying integers, to figure out the rules for dividing integers.

Division follows the same rules as multiplication!

For division of two signed numbers, when the:

- signs are the *same*, the quotient is *positive*.
- signs are *different*, the quotient is *negative*.

And remember that we can always check the answer of a division problem by multiplying.

# Multiplication and Division of Signed Numbers

For multiplication and division of two signed numbers:

- If the signs are the same, the result is positive.
- If the signs are different, the result is negative.

Same signs	Result
Two positives	Positive
Two negatives	Positive
If the signs are the same, the result is positive.	
Different signs	Result
Positive and negative	Negative
Negative and positive	Negative
If the signs are different, the result is negative.	

## Example 1.3.19

Divide:

a.  $(-27) \div 3$

b.  $-100 \div (-4)$

### Solution

a.

**Step 1: Divide. With different signs, the quotient is negative.**

$$-27 \div 3 = -9$$

b.

**Step 1: Divide. With signs that are the same, the quotient is positive.**

$$-100 \div (-4) = 25$$

## Try It

37) Divide:

a.  $-42 \div 6$

b.  $-117 \div -3$

**Solution**

a.  $-7$

b.  $39$

38) Divide:

a.  $-63 \div 7$

b.  $-115 \div -5$

**Solution**

a.  $-9$

b.  $23$

## Simplify Expressions with Integers

What happens when there are more than two numbers in an expression? The order of operations still applies when negatives are included. Remember My Dear Aunt Sally?

Let's try some examples. We'll simplify expressions that use all four operations with integers—addition, subtraction, multiplication, and division. Remember to follow the order of operations.

### Example 1.3.20

Simplify:  $7(-2) + 4(-7) - 6$ .

**Solution**

**Step 1: Multiply first.**

$$-14 + (-28) - 6$$

**Step 2: Add.**

$$-42 - 6$$

**Step 3: Subtract.**

$$-48$$

### Try It

39) Simplify:  $8(-3) + 5(-7) - 4$

**Solution**

$$-63$$

40) Simplify:  $9(-3) + 7(-8) - 1$

**Solution**

$$-84$$

### Example 1.3.21

Simplify:

a.  $(-2)^4$

b.  $-2^4$

**Solution**

a.

**Step 1: Write in expanded form.**

$$(-2)(-2)(-2)(-2)$$

**Step 2: Multiply.**

$$4(-2)(-2)$$

**Step 3: Multiply.**

$$-8(-2)$$

**Step 4: Multiply.**

$$16$$

---

b.

**Step 1: Write in expanded form. We are asked to find the opposite of  $2^4$ .**

$$-(2 \times 2 \times 2 \times 2)$$

**Step 2: Multiply.**

$$-(4 \times 2 \times 2)$$

**Step 3: Multiply.**

$$-(8 \times 2) = -16$$

---

Notice the difference in parts a and b. In part a, the exponent means to raise what is in the parentheses, the  $(-2)$  to the  $4^{\text{th}}$  power. In part b, the exponent means to raise just the 2 to the  $4^{\text{th}}$  power and then take the opposite.

## Try It

41) Simplify:

- a.  $(-3)^4$
- b.  $-3^4$

### Solution

- a. 81
- b. -81

42) Simplify:

- a.  $(-7)^2$
- b.  $-7^2$

### Solution

- a. 49
- b. -49

The next example reminds us to simplify inside parentheses first.

**Example 1.3.22**

Simplify:  $12 - 3(9 - 12)$

**Solution**

**Step 1: Subtract in parentheses first.**

$$12 - 3(-3)$$

**Step 2: Multiply.**

$$12 - (-9)$$

**Step 3: Subtract.**

$$21$$

**Try It**

43) Simplify:  $17 - 4(8 - 11)$

**Solution**

29

44) Simplify:  $16 - 6(7 - 13)$

**Solution**

52

**Example 1.3.23**

Simplify:  $8(-9) \div (-2)^3$

**Solution**

**Step 1: Exponents first.**

$$8(-9) \div (-8)$$

**Step 2: Multiply**

$$-72 \div -8$$

**Step 3: Divide.**

$$9$$

**Try It**

45) Simplify:  $12(-9) \div (-3)^3$

**Solution**

$$4$$

46) Simplify:  $18(-4) \div (-2)^3$

**Solution**

$$9$$

**Example 1.3.24**

Simplify:  $-30 \div +2 + (-3)(-7)$

**Solution**

**Step 1: Multiply and divide left to right, so divide first.**

$$-15 + (-3)(-7)$$

**Step 2: Add.**

$$-15 + 21 = 6$$

**Try It**

47) Simplify  $-27 \div 3 + (-5)(-6)$

**Solution**

21

48) Simplify  $-32 \div 4 + (-2)(-7)$

**Solution**

6

## Evaluate Variable Expressions with Integers

Remember that to evaluate an expression means to substitute a number for the variable in the expression. Now we can use negative numbers as well as positive numbers.

### Example 1.3.25

When  $n = -5$ , evaluate:

- a.  $n + 1$
- b.  $-n + 1$

#### Solution

a.

**Step 1: Substitute  $-5$  for  $n$ .**

$$-5 + 1$$

**Step 2: Simplify.**

$$-4$$

---

b.

**Step 1: Substitute  $-5$  for  $n$ .**

$$-(-5) + 1$$

**Step 2: Simplify.**

$$5 + 1$$

**Step 3: Add.**

$$6$$

## Try It

49) When  $n = -8$ , evaluate

- a.  $n + 2$
- b.  $-n + 2$

### Solution

- a.  $-6$
- b.  $10$

50) When  $y = -9$ , evaluate

- a.  $y + 8$
- b.  $-y + 8$ .

### Solution

- a.  $-1$
- b.  $17$

## Example 1.3.26

Evaluate  $(x + y)^2$  when  $x = -18$  and  $y = 24$ .

### Solution

**Step 1: Substitute  $-18$  for  $x$  and  $24$  for  $y$ .**

$$(-18 + 24)^2$$

**Step 2: Add inside parentheses.**

$$(6)^2$$

**Step 3: Simplify.**

$$36$$

## Try It

51) Evaluate  $(x + y)^2$  when  $x = -15$  and  $y = 29$

**Solution**

$$196$$

52) Evaluate  $(x + y)^3$  when  $x = -8$  and  $y = 10$

**Solution**

$$8$$

## Example 1.3.27

Evaluate  $20 - z$  when

- a.  $z = 12$
- b.  $z = -12$

**Solution**

a.

**Step 1: Substitute 12 for  $z$ .**

$$20 - 12$$

**Step 2: Subtract.**

$$8$$

---

b.

**Step 1: Substitute  $-12$  for  $z$ .**

$$20 - (-12)$$

**Step 2: Subtract.**

$$32$$

## Try It

53) Evaluate:  $17 - k$  when

a.  $k = 19$

b.  $k = -19$

**Solution**

a.  $-2$

b.  $36$

54) Evaluate:  $-5 - b$  when

a.  $b = 14$

b.  $b = -14$

**Solution**

a.  $-19$

b.  $9$

### Example 1.3.28

Evaluate:  $2x^2 + 3x + 8$  when  $x = 4$ .

**Solution**

Substitute 4 for  $x$ . Use parentheses to show multiplication.

**Step 1: Substitute.**

$$2(4)^2 + 3(4) + 8$$

**Step 2: Evaluate exponents.**

$$2(16) + 3(4) + 8$$

**Step 3: Multiply.**

$$32 + 12 + 8$$

**Step 4: Add.**

$$52$$

## Try It

55) Evaluate:  $3x^2 - 2x + 6$  when  $x = -3$ .

**Solution**

39

56) Evaluate:  $4x^2 - x - 5$  when  $x = -2$ .

**Solution**

13

## Translate Phrases to Expressions with Integers

Our earlier work translating English to algebra also applies to phrases that include both positive and negative numbers.

### Example 1.3.29

Translate and simplify: the sum of 8 and  $-12$ , increased by 3.

**Solution**

**Step 1: Translate.**

$$[8 + (-12)] + 3$$

**Step 2: Simplify. Be careful not to confuse the brackets with an absolute value sign.**

$$(-4) + 3$$

**Step 3: Add.**

$$-1$$

## Try It

57) Translate and simplify the sum of **9** and **−16**, increased by **4**.

**Solution**

$$(9 - 16) + 4 = 3$$

58) Translate and simplify the sum of **−8** and **−12**, increased by **7**.

**Solution**

$$(-8 - 12) + 7 = -13$$

When we first introduced the operation symbols, we saw that the expression may be read in several ways. They are listed below.

- $a - b$
- $a$  minus  $b$
- the difference of  $a$  and  $b$
- $b$  subtracted from  $a$
- $b$  less than  $a$

Be careful to get  $a$  and  $b$  in the right order!

### Example 1.3.30

Translate and then simplify

- a. The difference of **13** and **−21**
- b. Subtract **24** from **−19**

#### Solution

a.

**Step 1: Translate.**

$$13 - (-21)$$

**Step 2: Simplify.**

$$34$$

---

b.

**Step 1: Translate. Remember, “subtract  $b$  from  $a$ ” means  $a - b$ .**

$$-19 - 24$$

**Step 2: Simplify.**

$$-43$$

### Try It

59) Translate and simplify

- a. the difference of **14** and **−23**
- b. subtract **21** from **−17**

**Solution**

- a.  $14 - (-23) = 37$
- b.  $-17 - 21 = -38$

60) Translate and simplify

- a. the difference of **11** and **−19**
- b. subtract **18** from **−11**.

**Solution**

- a.  $11 - (-19) = 30$
- b.  $-11 - 18 = -29$

Once again, our prior work translating English to algebra transfers to phrases that include both multiplying and dividing integers. Remember that the keyword for multiplication is “product” and for division is “quotient.”

**Example 1.3.31**

Translate to an algebraic expression and simplify if possible: the product of **−2** and **14**.

**Solution**

**Step 1: Translate.**

$$(-2)(14)$$

**Step 2: Simplify.**

$$-28$$

## Try It

61) Translate to an algebraic expression and simplify if possible: the product of  $-5$  and  $12$ .

**Solution**

$$-5(12) = -60$$

62) Translate to an algebraic expression and simplify if possible: the product of  $8$  and  $-13$ .

**Solution**

$$8(-13) = -104$$

## Example 1.3.32

Translate to an algebraic expression and simplify if possible: the quotient of  $-56$  and  $-7$ .

**Solution**

**Step 1: Translate.**

$$-56 \div -7$$

**Step 2: Simplify.**

$$8$$

## Try It

63) Translate to an algebraic expression and simplify if possible: the quotient of  $-63$  and  $-9$ .

**Solution**

$$-63 \div -9 = 7$$

64) Translate to an algebraic expression and simplify if possible: the quotient of  $-72$  and  $-9$ .

**Solution**

$$-72 \div -9 = 8$$

## Use Integers in Applications

We'll outline a plan to solve applications. It's hard to find something if we don't know what we're looking for or what to call it! So when we solve an application, we first need to determine what the problem is asking us to find. Then we'll write a phrase that gives the information to find it. We'll translate the phrase into an expression and then simplify the expression to get the answer. Finally, we summarize the answer in a sentence to make sure it makes sense.

## How to Apply a Strategy to Solve Applications with Integers

### Example 1.3.33

The temperature in Urbana, Illinois one morning was  $11$  degrees. By mid-afternoon, the temperature had dropped to  $-9$  degrees. What was the difference of the morning and afternoon temperatures?

**Solution****Step 1: Read the problem. Make sure all the words and ideas are understood.****Step 2: Identify what we are asked to find.**

The difference of the morning and afternoon temperatures.

**Step 3: Write a phrase that gives the information to find it.**The *difference of* 11 and  $-9$ .**Step 4: Translate the phrase to an expression.**

$$11 - (-9)$$

**Step 5: Simplify the expression.**

$$20$$

**Step 6: Write a complete sentence that answers the question.**

The difference in temperatures was 20 degrees.

**Try It**

65) The temperature in Anchorage, Alaska one morning was 15 degrees. By mid-afternoon the temperature had dropped to 30 degrees below zero. What was the difference in the morning and afternoon temperatures?

**Solution**

The difference in temperatures was 45 degrees.

66) The temperature in Denver was  $-6$  degrees at lunchtime. By sunset the temperature had dropped to  $-15$  degrees. What was the difference in the lunchtime and sunset temperatures?

**Solution**

The difference in temperatures was 9 degrees.

## HOW TO

### Apply a Strategy to Solve Applications with Integers.

1. Read the problem. Make sure all the words and ideas are understood
2. Identify what we are asked to find.
3. Write a phrase that gives the information to find it.
4. Translate the phrase to an expression.
5. Simplify the expression.
6. Answer the question with a complete sentence.

### Example 1.3.34

The Mustangs football team received three penalties in the third quarter. Each penalty gave them a loss of fifteen yards. What is the number of yards lost?

#### **Solution**

**Step 1: Read the problem. Make sure all the words and ideas are understood.**

**Step 2: Identify what we are asked to find.**

The number of yards lost.

**Step 3: Write a phrase that gives the information to find it.**

Three times a 15-yard penalty.

**Step 4: Translate the phrase to an expression.**

$$3(-15)$$

**Step 5: Simplify the expression.**

$$-45$$

**Step 6: Answer the question with a complete sentence.**

The team lost **45** yards.

## Try It

67) The Bears played poorly and had seven penalties in the game. Each penalty resulted in a loss of **15** yards. What is the number of yards lost due to penalties?

### **Solution**

The Bears lost **105** yards.

68) Bill uses the ATM on campus because it is convenient. However, each time he uses it he is charged a \$2 fee. Last month he used the ATM eight times. How much was his total fee for using the ATM?

### **Solution**

A \$16 fee was deducted from his checking account.

## Key Concepts

- **Multiplication and Division of Two Signed Numbers**
  - Same signs—Product is positive
  - Different signs—Product is negative
- **Strategy for Applications**
  - Identify what you are asked to find.

- Write a phrase that gives the information to find it.
- Translate the phrase to an expression.
- Simplify the expression.
- Answer the question with a complete sentence

• **Addition of Positive and Negative Integers**

---

$$5 + 3 = 8$$

both positive,  
sum positive

$$-5 + (-3) = -8$$

both negative,  
sum negative

$$-5 + 3 = -2$$

different signs,  
more negatives  
sum negative

$$5 + (-3) = 2$$

different signs,  
more positives  
sum positive

---

- **Property of Absolute Value:**  $|n| \geq 0$  for all numbers. Absolute values are always greater than or equal to zero!
- **Subtraction of Integers**

---

$$5 - 3 = 2$$

5 positives  
take away 3 positives  
2 positive

$$-5 - (-3) = -2$$

5 negatives,  
take away 3 negatives  
2 negatives

$$-5 - 3 = -8$$

5 negatives, want to  
subtract 3 positives  
need neutral pairs

$$5 - (-3) = 2$$

5 positives, want to  
subtract 3 negatives  
need neutral pairs

---

- **Subtraction Property:** Subtracting a number is the same as adding its opposite.
- **Multiplication and Division of Two Signed Numbers**
  - Same signs—Product is positive
  - Different signs—Product is negative

• **Strategy for Applications**

1. Identify what you are asked to find.
2. Write a phrase that gives the information to find it.
3. Translate the phrase to an expression.
4. Simplify the expression.

5. Answer the question with a complete sentence.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=178#h5p-3>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## Glossary

### absolute value

The absolute value of a number is its distance from 0 on the number line. The absolute value of a number  $n$  is written as  $|n|$ .

### integers

The whole numbers and their opposites are called the integers: ...-3, -2, -1, 0, 1, 2, 3...

### opposite

The opposite of a number is the number that is the same distance from zero on the number line but on the opposite side of zero:  $-a$  means the opposite of the number  $a$ . The notation  $-a$  is read as “the opposite of  $a$ .”

# 1.4 FRACTIONS

## Learning Objectives

By the end of this section, you will be able to:

- Find equivalent fractions
- Simplify fractions
- Multiply fractions
- Divide fractions
- Simplify expressions written with a fraction bar
- Translate phrases to expressions with fractions
- Add or subtract fractions with a common denominator
- Add or subtract fractions with different denominators
- Use the order of operations to simplify complex fractions
- Evaluate variable expressions with fractions

## Find Equivalent Fractions

**Fractions** are a way to represent parts of a whole. The fraction  $\frac{1}{3}$  means that one whole has been divided into 3 equal parts and each part is one of the three equal parts. See (Figure 1.4.1). The fraction  $\frac{2}{3}$  represents two of three equal parts. In the fraction  $\frac{2}{3}$  the 2 is called the **numerator** and the 3 is called the **denominator**.

The circle on the left has been divided into 3 equal parts. Each part is  $\frac{1}{3}$  of the 3 equal parts. In the circle on the right,  $\frac{2}{3}$  of the circle is shaded (2 of the 3 equal parts).

Figure 1.4.1. The circle on the left has been divided into 3 equal parts. Each part is  $\frac{1}{3}$  of the 3 equal parts. In the circle on the right,  $\frac{2}{3}$  of the circle is shaded (2 of the 3 equal parts).

## Fraction

A fraction is written  $\frac{a}{b}$  where  $b \neq 0$  and

- $a$  is the *numerator* and  $b$  is the *denominator*

A fraction represents parts of a whole. The denominator  $b$  is the number of equal parts the whole has been divided into, and the numerator  $a$  indicates how many parts are included.

If a whole pie has been cut into 6 pieces and we eat all 6 pieces, we ate  $\frac{6}{6}$  pieces, or, in other words, one whole pie.

Figure 1.4.2

So  $\frac{6}{6} = 1$ . This leads us to the property of one that tells us that any number, except zero, divided by itself is 1.

## Property of One

$\frac{a}{a} = 1$  ( $a \neq 0$ ). Any number, except zero, divided by itself is one.

If a pie was cut in 6 pieces and we ate all 6, we ate  $\frac{6}{6}$  pieces, or, in other words, one whole pie. If the pie was cut into 8 pieces and we ate all 8, we ate  $\frac{8}{8}$  pieces, or one whole pie. We ate the same amount—one whole pie.

The fractions  $\frac{6}{6}$  and  $\frac{8}{8}$  have the same value, 1, and so they are called equivalent fractions. **Equivalent fractions** are fractions that have the same value.

Let's think of pizzas this time. Figure 1.4.2 shows two images: a single pizza on the left, cut into two equal pieces, and a second pizza of the same size, cut into eight pieces on the right. This is a way to show that  $\frac{1}{2}$  is equivalent to  $\frac{4}{8}$ . In other words, they are equivalent fractions.

Since the same amount of each pizza is shaded, we see that  $\frac{1}{2}$  is equivalent to  $\frac{4}{8}$ . They are equivalent fractions.

Figure 1.4.3. Since the same amount of each pizza is shaded, we see that  $\frac{1}{2}$  is equivalent to  $\frac{4}{8}$ . They are equivalent fractions.

## Equivalent Fractions

Equivalent fractions are fractions that have the same value.

How can we use mathematics to change  $\frac{1}{2}$  into  $\frac{4}{8}$ ? How could we take a pizza that is cut into 2 pieces and cut it into 8 pieces? We could cut each of the 2 larger pieces into 4 smaller pieces! The whole pizza would then be cut into 8 pieces instead of just 2. Mathematically, what we've described could be written like this as  $\frac{1 \times 4}{2 \times 4} = \frac{4}{8}$ . See Figure. 1.4.3.

Cutting each half of the pizza into 4 pieces, gives us pizza cut into 8 pieces:  $\frac{1 \times 4}{2 \times 4} = \frac{4}{8}$ .

1.4.4. Cutting each half of the pizza into 4 pieces, gives us pizza cut into 8 pieces.

This model leads to the following property:

## Equivalent Fractions Property

If  $a, b, c$  are numbers where  $b \neq 0, c \neq 0$ , then

$$\frac{a}{b} = \frac{ac}{bc} \text{ and } \frac{ac}{bc} = \frac{a}{b}$$

If we had cut the pizza differently, we could get

$$\begin{array}{lcl} \frac{1 \cdot 2}{2 \cdot 2} = \frac{2}{4} & \text{so} & \frac{1}{2} = \frac{2}{4} \\ \frac{1 \cdot 3}{2 \cdot 3} = \frac{3}{6} & \text{so} & \frac{1}{2} = \frac{3}{6} \\ \frac{1 \cdot 10}{2 \cdot 10} = \frac{10}{20} & \text{so} & \frac{1}{2} = \frac{10}{20} \end{array}$$

So, we say  $\frac{1}{2}$ ,  $\frac{2}{4}$ ,  $\frac{3}{6}$ , and  $\frac{10}{20}$  are equivalent fractions.

### Example 1.4.1

Find three fractions equivalent to  $\frac{2}{5}$

#### Solution

To find a fraction equivalent to  $\frac{2}{5}$ , we multiply the numerator and denominator by the same number. We can choose any number, except for zero. Let's multiply them by 2, 3, and then 5.

$$\frac{2 \times 2}{5 \times 2} = \frac{4}{10} \qquad \frac{2 \times 3}{5 \times 3} = \frac{6}{15} \qquad \frac{2 \times 5}{5 \times 5} = \frac{10}{25}$$

So,  $\frac{4}{10}$ ,  $\frac{6}{15}$ , and  $\frac{10}{25}$  are equivalent to  $\frac{2}{5}$ .

## Try It

1) Find three fractions equivalent to  $\frac{3}{5}$

**Solution**

$\frac{6}{10}, \frac{9}{15}, \frac{12}{20}$ ; answers may vary

2) Find three fractions equivalent to  $\frac{4}{5}$

**Solution**

$\frac{8}{10}, \frac{12}{15}, \frac{16}{20}$ ; answers may vary

## Simplify Fractions

A fraction is considered *simplified* if there are no common factors, other than 1, in its numerator and denominator.

For example,

- $\frac{2}{3}$  is simplified because there are no common factors of 2 and 3.
- $\frac{10}{15}$  is not simplified because 5 is a common factor of 10 and 15.

## Simplified Fraction

A fraction is considered simplified if there are no common factors in its numerator and denominator.

The phrase *reduce a fraction* means to simplify the fraction. We simplify, or reduce, a fraction by removing the common factors of the numerator and denominator. A fraction is not simplified until all common factors have been removed. If an expression has fractions, it is not completely simplified until the fractions are simplified.

In Example 1.4.2, we used the equivalent fractions property to find equivalent fractions. Now we'll use the equivalent fractions property in reverse to simplify fractions. We can rewrite the property to show both forms together.

### Equivalent Fractions Property

If  $a, b, c$  are numbers where  $b \neq 0, c \neq 0$ , then  $\frac{a}{b} = \frac{ac}{bc}$  and  $\frac{ac}{bc} = \frac{a}{b}$

### Example 1.4.2

Simplify:  $-\frac{32}{56}$ .

#### Solution

**Step 1:** Rewrite the numerator and denominator showing the common factors.

$$-\frac{4 \times 8}{7 \times 8}$$

**Step 2:** Simplify using the equivalent fractions property.

$$-\frac{4}{7}$$

Notice that the fraction  $-\frac{4}{7}$  is simplified because there are no more common factors.

## Try It

3) Simplify:  $-\frac{42}{54}$

**Solution**

$$-\frac{7}{9}$$

4) Simplify:  $-\frac{45}{81}$

**Solution**

$$-\frac{5}{9}$$

Sometimes it may not be easy to find common factors of the numerator and denominator. When this happens, a good idea is to factor the numerator and the denominator into prime numbers. Then divide out the common factors using the equivalent fractions property.

## Example 1.4.3

Simplify:  $-\frac{210}{385}$

**Solution**

**Step 1:** Rewrite the numerator and denominator to show the common factors. If needed, factor the numerator and denominator into prime numbers first.

Rewrite 210 and 385 as the product of the primes.

$$\begin{aligned}
 &= -\frac{210}{385} \\
 &= -\frac{2 \times 3 \times 5 \times 7}{5 \times 7 \times 11}
 \end{aligned}$$

**Step 2: Simplify using the equivalent fractions property by dividing out common factors.**

Mark the common factors 5 and 7. Divide out the common factors.

$$\begin{aligned}
 &= -\frac{2 \times 3 \times \cancel{5} \times \cancel{7}}{\cancel{5} \times \cancel{7} \times 11} \\
 &= -\frac{2 \times 3}{11}
 \end{aligned}$$

**Step 3: Multiply the remaining factors, if necessary.**

$$-\frac{6}{11}$$

## Try It

5) Simplify:  $-\frac{69}{120}$

**Solution**

$$-\frac{23}{40}$$

6) Simplify:  $-\frac{120}{192}$

**Solution**

$$-\frac{5}{8}$$

We now summarize the steps you should follow to simplify fractions.

## HOW TO

### Simplify a Fraction.

1. Rewrite the numerator and denominator to show the common factors.  
If needed, factor the numerator and denominator into prime numbers first.
2. Simplify using the equivalent fractions property by dividing out common factors.
3. Multiply any remaining factors, if needed.

### Example 1.4.4

Simplify:  $\frac{5x}{5y}$ .

#### Solution

**Step 1: Rewrite showing the common factors, then divide out the common factors.**

$$\frac{\cancel{5} \times x}{\cancel{5} \times y}$$

**Step 2: Simplify.**

$$\frac{x}{y}$$

## Try It

7) Simplify:  $\frac{7x}{7y}$

**Solution**

$$\frac{x}{y}$$

8) Simplify:  $\frac{3a}{3b}$

**Solution**

$$\frac{a}{b}$$

## Multiply Fractions

Many people find multiplying and dividing fractions easier than adding and subtracting fractions. So we will start with fraction multiplication.

We'll use a model to show you how to multiply two fractions and to help you remember the procedure. Let's start with  $\frac{3}{4}$ .

Figure 1.4.5

Now we'll take  $\frac{1}{2}$  of  $\frac{3}{4}$ .

Figure 1.4.6

Notice that now, the whole is divided into 8 equal parts. So  $\frac{1}{2} \times \frac{3}{4} = \frac{3}{8}$

To multiply fractions, we multiply the numerators and multiply the denominators.

### Fraction Multiplication

If  $a, b, c$  and  $d$  are numbers where  $b \neq 0$  and  $d \neq 0$ , then  $\frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd}$ .

To multiply fractions, multiply the numerators and multiply the denominators.

When multiplying fractions, the properties of positive and negative numbers still apply, of course. It is a good idea to determine the sign of the product as the first step. In Example 1.4.5, we will multiply negative and positive, so the product will be negative.

### Example 1.4.5

Multiply:  $-\frac{11}{12} \times \frac{5}{7}$

#### Solution

The first step is to find the sign of the product. Since the signs are the different, the product is negative.

**Step 1: Determine the sign of the product; multiply.**

$$-\frac{11 \times 5}{12 \times 7}$$

**Step 2:** Are there any common factors in the numerator and the denominator? No.

$$-\frac{55}{84}$$

## Try It

9) Multiply:  $-\frac{10}{28} \times \frac{8}{15}$

**Solution**

$$-\frac{4}{21}$$

10) Multiply:  $-\frac{9}{20} \times \frac{5}{12}$

**Solution**

$$-\frac{3}{16}$$

When multiplying a fraction by an integer, it may be helpful to write the integer as a fraction. Any integer,  $a$ , can be written as  $\frac{a}{1}$ . So, for example,  $3 = \frac{3}{1}$ .

### Example 1.4.6

Multiply:  $-\frac{12}{5}(-20x)$

**Solution**

Determine the sign of the product. The signs are the same, so the product is positive.

**Step 1: Write  $20x$  as a fraction.**

$$\frac{12}{5} \left( \frac{20x}{1} \right)$$

**Step 2: Multiply.**

**Step 3: Rewrite 20 to show the common factor 5 and divide it out.**

$$\frac{12 \times 4 \times \cancel{5}x}{\cancel{5} \times 1}$$

**Step 4: Simplify.**

$$48x$$

### Try It

11) Multiply:  $\frac{11}{3}(-9a)$

**Solution**

$$-33a$$

12) Multiply:  $\frac{13}{7}(-14b)$

**Solution**

$$-2b$$

## Divide Fractions

Now that we know how to multiply fractions, we are almost ready to divide. Before we can do that, that we need some vocabulary.

The **reciprocal** of a fraction is found by inverting the fraction, placing the numerator in the denominator and the denominator in the numerator. The reciprocal of  $\frac{2}{3}$  is  $\frac{3}{2}$ .

Notice that  $\frac{2}{3} \cdot \frac{3}{2} = 1$ . A number and its reciprocal multiply to 1.

To get a product of positive 1 when multiplying two numbers, the numbers must have the same sign. So reciprocals must have the same sign.

The reciprocal of  $-\frac{10}{7}$  is  $-\frac{7}{10}$ , since  $-\frac{10}{7} \left(-\frac{7}{10}\right) = 1$ .

### Reciprocal

The reciprocal of  $\frac{a}{b}$  is  $\frac{b}{a}$ .

A number and its reciprocal multiply to one  $\frac{a}{b} \times \frac{b}{a} = 1$

To divide fractions, we multiply the first fraction by the reciprocal of the second.

## Fraction Division

If  $a, b, c$  and  $d$  are numbers where  $b \neq 0, c \neq 0$  and  $d \neq 0$ , then

$$\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \times \frac{d}{c}$$

To divide fractions, we multiply the first fraction by the reciprocal of the second.

We need to say  $b \neq 0, c \neq 0$  and  $d \neq 0$  to be sure we don't divide by zero!

### Example 1.4.7

Divide:  $-\frac{2}{3} \div \frac{n}{5}$ .

#### Solution

**Step 1:** To divide, multiply the first fraction by the reciprocal of the second.

$$-\frac{2}{3} \times \frac{5}{n}$$

**Step 2:** Multiply.

$$-\frac{10}{3n}$$

## Try It

13) Divide:  $-\frac{3}{5} \div \frac{p}{7}$

**Solution**

$$-\frac{21}{5p}$$

14) Divide:  $-\frac{5}{8} \div \frac{q}{3}$

**Solution**

$$-\frac{15}{8q}$$

## Example 1.4.8

Find the quotient:  $-\frac{7}{8} \div \left(-\frac{14}{27}\right)$ .

**Solution**

**Step 1:** To divide, multiply the first fraction by the reciprocal of the second.

$$-\frac{7}{18} \times -\frac{27}{14}$$

**Step 2:** Determine the sign of the product, and then multiply.

$$\frac{7 \times 27}{18 \times 14}$$

**Step 3: Rewrite showing common factors.**

$$\frac{\cancel{7} \times \cancel{9} \times 3}{\cancel{9} \times 2 \times \cancel{7} \times 2}$$

**Step 4: Remove common factors.**

$$\frac{3}{2 \times 2}$$

**Step 5: Simplify.**

$$\frac{3}{4}$$

## Try It

15) Find the quotient:  $-\frac{7}{27} \div \left(-\frac{35}{36}\right)$

**Solution**

$$\frac{4}{15}$$

16) Find the quotient:  $-\frac{5}{14} \div \left(-\frac{15}{28}\right)$

**Solution**

$$\frac{2}{3}$$

There are several ways to remember which steps to take to multiply or divide fractions. One way is to repeat the call outs to yourself. If you do this each time you do an exercise, you will have the steps memorized.

- “To multiply fractions, multiply the numerators and multiply the denominators.”

- “To divide fractions, multiply the first fraction by the reciprocal of the second.”

Another way is to keep two examples in mind:

One fourth of two pizzas is one half of a pizza.

There are eight quarters in \$2.00.

$$2 \cdot \frac{1}{4}$$

$$\frac{2}{1} \cdot \frac{1}{4}$$

$$\frac{2}{4}$$

$$\frac{1}{2}$$

$$2 \div \frac{1}{4}$$

$$\frac{2}{1} \div \frac{1}{4}$$

$$\frac{2}{1} \cdot \frac{4}{1}$$

$$8$$

Figure 1.4.7

The numerators or denominators of some fractions contain fractions themselves. A fraction in which the numerator or the denominator is a fraction is called a **complex fraction**.

## Complex Fraction

A complex fraction is a fraction in which the numerator or the denominator contains a fraction.

Some examples of complex fractions are:

$$\frac{\frac{6}{7}}{3} \quad \frac{\frac{3}{4}}{\frac{5}{8}} \quad \frac{\frac{x}{2}}{\frac{5}{6}}$$

To simplify a complex fraction, we remember that the fraction bar means division. For example, the complex

fraction  $\frac{\frac{3}{4}}{\frac{5}{8}}$  means  $\frac{3}{4} \div \frac{5}{8}$ .

### Example 1.4.9

Simplify:  $\frac{\frac{3}{4}}{\frac{5}{8}}$

**Solution**

**Step 1: Rewrite as division.**

$$\frac{3}{4} \div \frac{5}{8}$$

**Step 2: Multiply the first fraction by the reciprocal of the second.**

$$\frac{3}{4} \times \frac{8}{5}$$

**Step 3: Multiply.**

$$\frac{3 \times 8}{4 \times 5}$$

**Step 4: Look for common factors.**

$$\frac{3 \times \cancel{4} \times 2}{\cancel{4} \times 5}$$

**Step 5: Divide out common factors and simplify.**

$$\frac{6}{5}$$

## Try It

17) Simplify:  $\frac{\frac{2}{3}}{\frac{5}{6}}$

**Solution**

$$\frac{4}{5}$$

18) Simplify:  $\frac{\frac{3}{7}}{\frac{6}{11}}$

**Solution**

$$\frac{11}{14}$$

## Example 1.4.10

Simplify:  $\frac{\frac{x}{2}}{\frac{xy}{6}}$

**Solution**

**Step 1:** Rewrite as division.

$$\frac{x}{2} \div \frac{xy}{6}$$

**Step 2:** Multiply the first fraction by the reciprocal of the second.

$$\frac{x}{2} \times \frac{6}{xy}$$

**Step 3: Multiply.**

$$\frac{x \times 6}{2 \times xy}$$

**Step 4: Look for common factors.**

$$\frac{\cancel{x} \times 3 \times \cancel{2}}{\cancel{2} \times \cancel{x} \times y}$$

**Step 5: Divide out common factors and simplify.**

$$\frac{3}{y}$$

## Try It

19) Simplify:  $\frac{\frac{a}{8}}{\frac{ab}{6}}$

**Solution**

$$\frac{3}{4b}$$

20) Simplify:  $\frac{\frac{p}{2}}{\frac{pq}{8}}$

**Solution**

$$\frac{4}{2q}$$

## Simplify Expressions with a Fraction Bar

The line that separates the numerator from the denominator in a fraction is called a fraction bar. A fraction bar acts as grouping symbol. The order of operations then tells us to simplify the numerator and then the denominator. Then we divide.

To simplify the expression  $\frac{5 - 3}{7 + 1}$ , we first simplify the numerator and the denominator separately. Then we divide.

$$\begin{aligned} &= \frac{5 - 3}{7 + 1} \\ &= \frac{2}{8} \\ &= \frac{1}{4} \end{aligned}$$

### HOW TO

#### Simplify an Expression with a Fraction Bar.

1. Simplify the expression in the numerator.
2. Simplify the expression in the denominator.
3. Simplify the fraction.

### Example 1.4.11

Simplify:  $\frac{4 - 2(3)}{2^2 + 2}$

#### Solution

**Step 1:** Use the order of operations to simplify the numerator and the denominator.

$$\frac{4 - 6}{4 + 2}$$

**Step 2: Simplify the numerator and the denominator.**

$$\frac{-2}{6}$$

**Step 3: Simplify. A negative divided by a positive is negative.**

$$-\frac{1}{3}$$

## Try It

21) Simplify:  $\frac{6 - 3(5)}{3^2 + 3}$

**Solution**

$$-\frac{3}{4}$$

22) Simplify:  $\frac{4 - 4(6)}{3^2 + 3}$

**Solution**

$$-\frac{2}{3}$$

Where does the negative sign go in a fraction? Usually the negative sign is in front of the fraction, but you will sometimes see a fraction with a negative numerator, or sometimes with a negative denominator. Remember that fractions represent division. When the numerator and denominator have different signs, the quotient is negative.

$$\frac{-1}{3} = -\frac{1}{3}$$

$$\frac{1}{-3} = -\frac{1}{3}$$

$$\frac{\text{negative}}{\text{positive}} = \text{negative}$$

$$\frac{\text{positive}}{\text{negative}} = \text{negative}$$

## Placement of Negative Sign in a Fraction

For any positive numbers  $a$  and  $b$ ,

$$\frac{-a}{b} = \frac{a}{-b} = -\frac{a}{b}$$

### Example 1.4.12

Simplify:  $\frac{4(-3) + 6(-2)}{-3(2) - 2}$

**Solution**

**Step 1: Multiply.**

$$\frac{-12 + (-12)}{-6 - 2}$$

**Step 2: Simplify.**

$$\frac{-24}{-8}$$

**Step 3: Divide.**

$$3$$

## Try It

23) Simplify:  $\frac{8(-2) + 4(-3)}{-5(2) + 3}$

**Solution**

4

24) Simplify:  $\frac{7(-1) + 9(-3)}{-5(3) - 2}$

**Solution**

2

## Translate Phrases to Expressions with Fractions

Now that we have done some work with fractions, we are ready to translate phrases that would result in expressions with fractions.

The English words quotient and ratio are often used to describe fractions. Remember that “quotient” means division. The quotient of  $a$  and  $b$  is the result we get from dividing  $a$  by  $b$ , or  $\frac{a}{b}$ .

### Example 1.4.13

Translate the English phrase into an algebraic expression: the quotient of the difference of  $m$  and  $n$ , and  $p$ .

**Solution**

We are looking for the *quotient of* the difference of  $m$  and  $n$ , and  $p$ . This means we want to divide the difference of  $m$  and  $n$  by  $p$ .

$$\frac{m - n}{p}$$

## Try It

25) Translate the English phrase into an algebraic expression: the quotient of the difference of  $a$  and  $b$ , and  $cd$ .

**Solution**

$$\frac{a - b}{cd}$$

26) Translate the English phrase into an algebraic expression: the quotient of the sum of  $p$  and  $q$ , and  $r$

**Solution**

$$\frac{p + q}{r}$$

## Add or Subtract Fractions with a Common Denominator

When we multiplied fractions, we just multiplied the numerators and multiplied the denominators right straight across. To add or subtract fractions, they must have a common denominator.

## Fraction Addition and Subtraction

If  $a$ ,  $b$ , and  $c$  are numbers where  $c \neq 0$ , then

$$\frac{a}{c} + \frac{b}{c} = \frac{a+b}{c} \quad \text{and} \quad \frac{a}{c} - \frac{b}{c} = \frac{a-b}{c}$$

To add or subtract fractions, add or subtract the numerators and place the result over the common denominator.

### Example 1.4.14

Find the sum:  $\frac{x}{3} + \frac{2}{3}$ .

#### Solution

**Step 1:** Add the numerators and place the sum over the common denominator.

$$\frac{x+2}{3}$$

### Try It

27) Find the sum:  $\frac{x}{4} + \frac{3}{4}$

#### Solution

$$\frac{x + 3}{4}$$

28) Find the sum:  $\frac{y}{8} + \frac{5}{8}$

**Solution**

$$\frac{y + 5}{8}$$

### Example 1.4.15

Find the difference:  $-\frac{23}{24} - \frac{13}{24}$ .

**Solution**

**Step 1:** Subtract the numerators and place the difference over the common denominator.

$$\frac{-23 - 13}{24}$$

**Step 2:** Simplify.

$$\frac{-36}{24}$$

**Step 3:** Simplify. Remember,  $-\frac{a}{b} = \frac{-a}{b}$ .

$$-\frac{3}{2}$$

## Try It

29) Find the difference:  $-\frac{19}{28} - \frac{7}{28}$

**Solution**

$$-\frac{26}{28}$$

30) Find the difference:  $-\frac{27}{32} - \frac{1}{32}$

**Solution**

$$-\frac{7}{8}$$

## Example 1.4.16

Simplify:  $-\frac{10}{x} - \frac{4}{x}$

**Solution**

**Step 1:** Subtract the numerators and place the difference over the common denominator.

$$\frac{-14}{x}$$

**Step 2:** Rewrite with the sign in front of the fraction.

$$-\frac{14}{x}$$

## Try It

31) Find the difference:  $-\frac{9}{x} - \frac{7}{x}$

**Solution**

$$-\frac{16}{x}$$

32) Find the difference:  $-\frac{17}{a} - \frac{5}{a}$

**Solution**

$$-\frac{22}{a}$$

Now we will do an example that has both addition and subtraction.

## Example 1.4.17

Simplify:  $\frac{3}{8} + \left(-\frac{5}{8}\right) - \frac{1}{8}$

**Solution**

**Step 1:** Add and subtract fractions—do they have a common denominator? Yes.

$$\frac{3}{8} + \left(-\frac{5}{8}\right) - \frac{1}{8}.$$

**Step 2:** Add and subtract the numerators and place the difference over the common denominator.

$$\frac{3 + (-5) - 1}{8}$$

**Step 3: Simplify left to right.**

$$\frac{-2 - 1}{8}$$

**Step 4: Simplify.**

$$-\frac{3}{8}$$

## Try It

33) Simplify:  $\frac{-2}{9} + \left(-\frac{4}{9}\right) - \frac{7}{9}$

**Solution**

$$-1$$

34) Simplify:  $\frac{5}{9} + \left(-\frac{4}{9}\right) - \frac{7}{9}$

**Solution**

$$-\frac{2}{3}$$

## Add or Subtract Fractions with Different Denominators

As we have seen, to add or subtract fractions, their denominators must be the same. The **least common denominator** (LCD) of two fractions is the smallest number that can be used as a common denominator of the fractions. The LCD of the two fractions is the least common multiple (LCM) of their denominators.

## Least Common Denominator

The least common denominator (LCD) of two fractions is the least common multiple (LCM) of their denominators.

After we find the least common denominator of two fractions, we convert the fractions to equivalent fractions with the LCD. Putting these steps together allows us to add and subtract fractions because their denominators will be the same!

### Example 1.4.18

Add:  $\frac{7}{12} + \frac{5}{18}$

#### **Solution**

**Step 1: Do they have a common denominator?**

$$\left. \begin{array}{l} 12 = 2 \times 2 \times 3 \\ 18 = 2 \times 3 \times 3 \end{array} \right\} \text{LCD} = 2 \times 2 \times 3 \times 3 = 36$$

No – rewrite each fraction with the LCD (least common denominator).

$$\begin{aligned} &= \frac{7}{12} + \frac{5}{18} \\ &= \frac{7 \times 3}{12 \times 3} + \frac{5 \times 2}{18 \times 2} \\ &= \frac{21}{36} + \frac{10}{36} \text{ Do not simplify LCD fractions.} \end{aligned}$$

**Step 2: Add or subtract the fractions.**

Add.

$$\frac{31}{36}$$

**Step 3: Simplify, if possible.**

Because 31 is a prime number, it has no factors in common with 36. The answer is simplified.

**Try It**

35) Add:  $\frac{7}{12} + \frac{11}{15}$

**Solution**

$$\frac{79}{60}$$

36) Add:  $\frac{13}{15} + \frac{17}{20}$

**Solution**

$$\frac{103}{60}$$

**HOW TO****Add or Subtract Fractions.**

1. Do they have a common denominator?
  - Yes—go to step 2.

- No—rewrite each fraction with the LCD (least common denominator). Find the LCD. Change each fraction into an equivalent fraction with the LCD as its denominator.
2. Add or subtract the fractions.
  3. Simplify, if possible.

When finding the equivalent fractions needed to create the common denominators, there is a quick way to find the number we need to multiply both the numerator and denominator. This method works if we found the LCD by factoring into primes.

Look at the factors of the LCD and then at each column above those factors. The “missing” factors of each denominator are the numbers we need.

$$\begin{array}{r}
 \text{missing} \\
 \text{factors} \\
 12 = 2 \cdot 2 \cdot 3 \\
 18 = 2 \cdot \quad 3 \cdot 3 \\
 \hline
 \text{LCD} = 2 \cdot 2 \cdot 3 \cdot 3 \\
 \text{LCD} = 36
 \end{array}$$

Figure 1.4.8

In the above figure the LCD, 36, has two factors of 2 and two factors of 3.

The numerator 12 has two factors of 2 but only one of 3—so it is “missing” one 3—we multiply the numerator and denominator by 3.

The numerator 18 is missing one factor of 2—so we multiply the numerator and denominator by 2.

We will apply this method as we subtract the fractions in Example 1.4.19

**Example 1.4.19**

Subtract:  $\frac{7}{15} - \frac{19}{24}$

**Solution****Step 1: Find the LCD.**

Do the fractions have a common denominator? No, so we need to find the LCD.

Notice, 15 is “missing” three factors of 2 and 24 is “missing” the 5 from the factors of the LCD.

So we multiply 8 in the first fraction and 5 in the second fraction to get the LCD.

$$\begin{aligned}
 \left. \begin{array}{l} 15 \\ 24 \end{array} \right\} &= \left. \begin{array}{l} 3 \times 5 \\ 2 \times 2 \times 2 \times 3 \end{array} \right\} LCD = 2 \times 2 \times 2 \times 3 \times 5 = 120 \\
 &= \frac{7}{15} - \frac{19}{24} \\
 &= \frac{7 \times 8}{15 \times 8} - \frac{19 \times 5}{24 \times 5}
 \end{aligned}$$

**Step 2: Rewrite as equivalent fractions with the LCD.**

$$\frac{56}{120} - \frac{95}{120}$$

**Step 3: Subtract.**

$$\frac{39}{120}$$

**Step 4: Check to see if the answer can be simplified.**

$$\frac{13 \times 3}{40 \times 3}$$

**Step 5: Simplify.**

Both 39 and 120 have a factor of 3.

$$\frac{13}{40}$$

Do not simplify the equivalent fractions! If you do, you'll get back to the original fractions and lose the common denominator!

## Try It

37) Subtract:  $\frac{13}{24} - \frac{17}{32}$

**Solution**

$$\frac{1}{96}$$

38) Subtract:  $\frac{21}{32} - \frac{9}{28}$

**Solution**

$$\frac{75}{224}$$

In the next example, one of the fractions has a variable in its numerator. Notice that we do the same steps as when both numerators are numbers.

## Example 1.4.20

Add:  $\frac{3}{5} + \frac{x}{8}$

**Solution**

The fractions have different denominators.

**Step 1: Find the LCD.**

$$\left. \begin{array}{l} 5 = \\ 8 = 2 \times 2 \times 2 \end{array} \right\} LCD = 2 \times 2 \times 2 \times 5 = 40$$

**Step 2: Rewrite as equivalent fractions with the LCD.**

$$\frac{3 \times 8}{5 \times 8} + \frac{x \times 5}{8 \times 5}$$

**Step 3: Simplify.**

$$\frac{24}{40} + \frac{5x}{40}$$

**Step 4: Add.**

$$\frac{24 + 5x}{40}$$

Remember, we can only add like terms: **24** and **5x** are not like terms.

## Try It

39) Add:  $\frac{y}{6} + \frac{7}{9}$

**Solution**

$$\frac{9y + 42}{54}$$

40) Add:  $\frac{x}{6} + \frac{7}{15}$

**Solution**

$$\frac{15x + 42}{135}$$

We now have all four operations for fractions. The table below summarizes fraction operations.

---

**Fraction Multiplication**

$$\frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd}$$

Multiply the numerators and multiply the denominators

**Fraction Division**

$$\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \times \frac{d}{c}$$

Multiply the first fraction by the reciprocal of the second.

**Fraction Addition**

$$\frac{a}{c} + \frac{b}{c} = \frac{a+b}{c}$$

Add the numerators and place the sum over the common denominator.

**Fraction Subtraction**

$$\frac{a}{c} - \frac{b}{c} = \frac{a-b}{c}$$

Subtract the numerators and place the difference over the common denominator.

To multiply or divide fractions, an LCD is NOT needed.

To add or subtract fractions, an LCD is needed.

---

### Example 1.4.21

Simplify:

a.  $\frac{5x}{6} - \frac{3}{10}$

b.  $\frac{5x}{6} \times \frac{3}{10}$

**Solution**

First ask, “What is the operation?” Once we identify the operation that will determine whether we need a common denominator. Remember, we need a common denominator to add or subtract, but not to multiply or divide.

a. What is the operation? The operation is subtraction.

**Step 1: Do the fractions have a common denominator? No.**

$$\frac{5x}{6} - \frac{3}{10}$$

**Step 2:** Rewrite each fraction as an equivalent fraction with the LCD.

$$\frac{5x \times 5}{6 \times 5} - \frac{3 \times 3}{10 \times 3}$$

**Step 3:** Subtract the numerators and place the difference over the common denominators.

$$\frac{25x}{30} - \frac{9}{30}$$

**Step 4:** Simplify, if possible There are no common factors. The fraction is simplified.

$$\frac{25x - 9}{30}$$

b. What is the operation? Multiplication.

**Step 1:** To multiply fractions, multiply the numerators and multiply the denominators.

$$\frac{5x \times 3}{6 \times 10}$$

**Step 2:** Rewrite, showing common factors.

$$\frac{\cancel{5}x \times \cancel{3}}{2 \times \cancel{3} \times 2 \times \cancel{5}}$$

**Step 3:** Remove common factors.

**Step 4:** Simplify.

$$\frac{x}{4}$$

Notice we needed an LCD to add  $\frac{5x}{6} - \frac{3}{10}$ , but not to multiply  $\frac{5x}{6} \times \frac{3}{10}$ .

## Try It

41) Simplify:

a.  $\frac{3a}{4} - \frac{8}{9}$

b.  $\frac{3a}{4} \times \frac{8}{9}$

**Solution**

a.  $\frac{27a - 32}{36}$

b.  $\frac{2a}{3}$

42) Simplify:

a.  $\frac{4k}{5} - \frac{1}{6}$

b.  $\frac{4k}{5} \times \frac{1}{6}$

**Solution**

a.  $\frac{24k - 5}{30}$

b.  $\frac{2k}{15}$

## Use the Order of Operations to Simplify Complex Fractions

We have seen that a complex fraction is a fraction in which the numerator or denominator contains a fraction.

The fraction bar indicates division. We simplified the complex fraction  $\frac{\frac{3}{4}}{\frac{5}{8}}$  by dividing  $\frac{3}{4}$  by  $\frac{5}{8}$ .

Now we'll look at complex fractions where the numerator or denominator contains an expression that can be simplified. So we first must completely simplify the numerator and denominator separately using the order of operations. Then we divide the numerator by the denominator.

### Example 1.4.22

Simplify:  $\frac{\left(\frac{1}{2}\right)^2}{4 + 3^2}$ .

#### Solution

Step 1: Simplify the numerator.

\*Remember,  $\left(\frac{1}{2}\right)^2$  means  $\frac{1}{2} \cdot \frac{1}{2}$

$$\begin{aligned} &= \frac{\left(\frac{1}{2}\right)^2}{4 + 3^2} \\ &= \frac{\frac{1}{4}}{4 + 3^2} \end{aligned}$$

**Step 2: Simplify the denominator.**

$$\begin{aligned} &= \frac{\frac{1}{4}}{4 + 9} \\ &= \frac{\frac{1}{4}}{13} \end{aligned}$$

**Step 3: Divide the numerator by the denominator. Simplify if possible.**

\*Remember,  $13 = \frac{13}{1}$

$$\begin{aligned}
 &= \frac{1}{4} \div 13 \\
 &= \frac{1}{4} \times \frac{1}{13} \\
 &= \frac{1}{52}
 \end{aligned}$$

## Try It

43) Simplify:  $\frac{\left(\frac{1}{3}\right)^2}{2^3 + 2}$

**Solution**

$$\frac{1}{90}$$

44) Simplify:  $\frac{1 + 4^2}{\left(\frac{1}{4}\right)^2}$

**Solution**

$$272$$

## Simplify Complex Fractions

1. Simplify the numerator.
2. Simplify the denominator.
3. Divide the numerator by the denominator. Simplify if possible.

### Example 1.4.23

Simplify:  $\frac{\frac{1}{2} + \frac{2}{3}}{\frac{3}{4} - \frac{1}{6}}$

#### Solution

It may help to put parentheses around the numerator and the denominator.

**Step 1: Simplify the numerator (LCD = 6) and simplify the denominator (LCD = 12).**

$$\frac{\left(\frac{3}{6} + \frac{4}{6}\right)}{\left(\frac{9}{12} - \frac{2}{12}\right)}$$

**Step 2: Simplify.**

$$\frac{\left(\frac{7}{6}\right)}{\left(\frac{7}{12}\right)}$$

**Step 3: Divide the numerator by the denominator.**

$$\frac{7}{6} \times \frac{12}{7}$$

**Step 4: Simplify.**

**Step 5: Divide out common factors.**

$$\frac{7 \times 6 \times 2}{6 \times 7}$$

**Step 6: Simplify.**

$$2$$

## Try It

45) Simplify:  $\frac{\frac{1}{3} + \frac{1}{2}}{\frac{3}{4} - \frac{1}{3}}$

**Solution**

$$2$$

46) Simplify:  $\frac{\frac{2}{3} - \frac{1}{2}}{\frac{1}{4} + \frac{1}{3}}$

**Solution**

$$\frac{2}{7}$$

## Evaluate Variable Expressions with Fractions

We have evaluated expressions before, but now we can evaluate expressions with fractions. Remember, to evaluate an expression, we substitute the value of the variable into the expression and then simplify.

### Example 1.4.24

Evaluate  $x + \frac{1}{3}$  when

a.  $x = -\frac{1}{3}$

b.  $x = -\frac{3}{4}$

**Solution**

a. To evaluate  $x + \frac{1}{3}$  when  $x = -\frac{1}{3}$ , substitute  $-\frac{1}{3}$  for  $x$  in the expression.

**Step 1: Substitute  $-\frac{1}{3}$  for  $x$ .**

$$-\frac{1}{3} + \frac{1}{3}$$

**Step 2: Simplify.**

$$0$$

---

b. To evaluate  $x + \frac{1}{3}$  when  $x = -\frac{3}{4}$ , we substitute  $-\frac{3}{4}$  for  $x$  in the expression.

**Step 1: Substitute  $-\frac{3}{4}$  for  $x$ .**

$$-\frac{3}{4} + \frac{1}{3}$$

**Step 2: Rewrite as equivalent fractions with the LCD, 12.**

$$-\frac{3 \times 3}{4 \times 3} + \frac{1 \times 4}{3 \times 4}$$

**Step 3: Simplify.**

$$-\frac{9}{12} + \frac{4}{12}$$

**Step 4: Add.**

$$-\frac{5}{12}$$

## Try It

47) Evaluate  $x + \frac{3}{4}$  when

a.  $x = -\frac{7}{4}$

b.  $x = -\frac{5}{4}$

**Solution**

a.  $-1$

b.  $\frac{1}{2}$

48) Evaluate  $y + \frac{1}{2}$  when

a.  $y = \frac{2}{3}$

b.  $y = -\frac{3}{4}$

**Solution**

a.  $\frac{7}{6}$

b.  $-\frac{1}{12}$

### Example 1.4.25

Evaluate  $-\frac{5}{6} - y$  when  $y = -\frac{2}{3}$

**Solution**

**Step 1: Substitute  $-\frac{2}{3}$  for  $y$ .**

$$-\frac{5}{6} - \left(-\frac{2}{3}\right)$$

**Step 2: Rewrite as equivalent fractions with the LCD, 6.**

$$-\frac{5}{6} - \left(-\frac{4}{6}\right)$$

**Step 3: Subtract.**

$$-\frac{5 - (-4)}{6}$$

**Step 4: Simplify.**

$$-\frac{1}{6}$$

### Try It

49) Evaluate  $-\frac{1}{2} - y$  when  $y = -\frac{1}{4}$

**Solution**

$$-\frac{1}{4}$$

50) Evaluate  $-\frac{3}{8} - y$  when  $x = -\frac{5}{2}$

**Solution**

$$-\frac{17}{8}$$

### Example 1.4.26

Evaluate  $2x^2y$  when  $x = \frac{1}{4}$  and  $y = -\frac{2}{3}$

**Solution**

Substitute the values into the expression.

**Step 1: Substitute**  $\frac{1}{4}$  **for**  $x$  **and**  $-\frac{2}{3}$  **for**  $y$ .

$$2\left(\frac{1}{4}\right)^2\left(-\frac{2}{3}\right)$$

**Step 2: Simplify exponents first.**

$$2\left(\frac{1}{16}\right)\left(-\frac{2}{3}\right)$$

**Step 3: Multiply. Divide out the common factors. Notice we write 16 as  $2 \cdot 2 \cdot 4$  to make it easy to remove common factors.**

$$\frac{\cancel{2} \times 1 \times \cancel{2}}{\cancel{2} \times \cancel{2} \times 4 \times 3}$$

**Step 4: Simplify.**

$$\frac{1}{12}$$

## Try It

51) Evaluate  $3ab^2$  when  $a = -\frac{2}{3}$  and  $b = -\frac{1}{2}$

**Solution**

$$-\frac{1}{2}$$

52) Evaluate  $4c^3d$  when  $c = -\frac{1}{2}$  and  $d = -\frac{4}{3}$

**Solution**

$$\frac{2}{3}$$

The next example will have only variables, no constants.

## Example 1.4.27

Evaluate  $\frac{p+q}{r}$  when  $p = -4$ ,  $q = -2$ , and  $r = 8$

**Solution**

To evaluate  $\frac{p+q}{r}$  when  $p = -4$ ,  $q = -2$ , and  $r = 8$ , we substitute the values into the expression.

**Step 1: Substitute**  $-4$  for  $p$ ,  $-2$  for  $q$ , and  $8$  for  $r$ .

$$\frac{-4 + (-2)}{8}$$

**Step 2: Add in the numerator first.**

$$\frac{-6}{8}$$

**Step 3: Simplify.**

$$-\frac{3}{4}$$

## Try It

53) Evaluate  $\frac{a+b}{c}$  when  $a = -8$ ,  $b = -7$ , and  $c = 6$

**Solution**

$$-\frac{5}{2}$$

54) Evaluate  $\frac{x+y}{z}$  when  $x = 9$ ,  $y = -18$ , and  $z = -6$

**Solution**

$$\frac{3}{2}$$

## Key Concepts

- **Equivalent Fractions Property:** If  $a, b, c$  are numbers where  $b \neq 0, c \neq 0$ , then  $\frac{a}{b} = \frac{a \times c}{b \times c}$  and  $\frac{a \times c}{b \times c} = \frac{a}{b}$ .
- **Fraction Division:** If  $a, b, c$  and  $d$  are numbers where  $b \neq 0, c \neq 0$ , and  $d \neq 0$ , then  $\frac{a}{b} \div \frac{c}{d} = \frac{a}{b} \times \frac{d}{c}$ . To divide fractions, multiply the first fraction by the reciprocal of the second.
- **Fraction Multiplication:** If  $a, b, c$  and  $d$  are numbers where  $b \neq 0$ , and  $d \neq 0$ , then  $\frac{a}{b} \times \frac{c}{d} = \frac{ac}{bd}$ . To multiply fractions, multiply the numerators and multiply the denominators.
- **Placement of Negative Sign in a Fraction:** For any positive numbers  $a$  and  $b$ ,  $\frac{-a}{b} = \frac{a}{-b} = -\frac{a}{b}$ .
- **Property of One:**  $\frac{a}{a} = 1$ ; Any number, except zero, divided by itself is one.
- **Simplify a Fraction**
  1. Rewrite the numerator and denominator to show the common factors. If needed, factor the numerator and denominator into prime numbers first.
  2. Simplify using the equivalent fractions property by dividing out common factors.
  3. Multiply any remaining factors.
- **Simplify an Expression with a Fraction Bar**
  1. Simplify the expression in the numerator. Simplify the expression in the denominator.
  2. Simplify the fraction.
- **Fraction Addition and Subtraction:** If  $a, b$ , and  $c$  are numbers where  $c \neq 0$ , then  $\frac{a}{c} + \frac{b}{c} = \frac{a+b}{c}$  and  $\frac{a}{c} - \frac{b}{c} = \frac{a-b}{c}$ . To add or subtract fractions, add or subtract the numerators and place the result over the common denominator.

### • Strategy for Adding or Subtracting Fractions

1. Do they have a common denominator?  
 Yes—go to step 2.  
 No—Rewrite each fraction with the LCD (Least Common Denominator). Find the LCD.  
 Change each fraction into an equivalent fraction with the LCD as its denominator.
2. Add or subtract the fractions.
3. Simplify, if possible. To multiply or divide fractions, an LCD IS NOT needed. To add or subtract fractions, an LCD IS needed.

### • Simplify Complex Fractions

1. Simplify the numerator.
2. Simplify the denominator.
3. Divide the numerator by the denominator. Simplify if possible.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=230#h5p-4>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## Glossary

### complex fraction

A complex fraction is a fraction in which the numerator or the denominator contains a fraction.

### denominator

The denominator is the value on the bottom part of the fraction that indicates the number of equal parts into which the whole has been divided.

### equivalent fractions

Equivalent fractions are fractions that have the same value.

### fraction

A fraction is written  $\frac{a}{b}$ , where  $b \neq 0$   $a$  is the numerator and  $b$  is the denominator. A fraction represents parts of a whole. The denominator  $b$  is the number of equal parts the whole has been divided into, and the numerator  $a$  indicates how many parts are included.

### numerator

The numerator is the value on the top part of the fraction that indicates how many parts of the whole are included.

### reciprocal

The reciprocal of  $\frac{a}{b}$  is  $\frac{b}{a}$ . A number and its reciprocal multiply to one:  $\frac{a}{b} \cdot \frac{b}{a} = 1$ .

### simplified fraction

A fraction is considered simplified if there are no common factors in its numerator and denominator.

### least common denominator

The least common denominator (LCD) of two fractions is the Least common multiple (LCM) of their denominators.

# 1.5 DECIMALS

---

## Learning Objectives

By the end of this section, you will be able to:

- Name and write decimals
- Round decimals
- Add and subtract decimals
- Multiply and divide decimals
- Convert decimals, fractions, and percents

## Name and Write Decimals

**Decimals** are another way of writing fractions whose denominators are powers of 10.

$$0.1 = \frac{1}{10}$$

0.1 is “one tenth”

$$0.01 = \frac{1}{100}$$

0.01 is “one hundredth”

$$0.001 = \frac{1}{1000}$$

0.001 is “one thousandth”

$$0.0001 = \frac{1}{10000}$$

0.0001 is “one ten-thousandth”

Notice that “ten thousand” is a number larger than one, but “one ten-thousandth” is a number smaller than one. The “th” at the end of the name tells you that the number is smaller than one.

When we name a whole number, the name corresponds to the place value based on the powers of ten. We read 10,000 as “ten thousand” and 10,000,000 as “ten million.” Likewise, the names of the decimal places

correspond to their fraction values. (Figure 1.5.1) shows the names of the place values to the left and right of the *decimal* point.

Place value of decimal numbers are shown to the left and right of the decimal point.

Place Value											
Hundred thousands	Ten thousands	Thousands	Hundreds	Tens	Ones	.	Tenths	Hundredths	Thousandths	Ten-thousandths	Hundred-thousandths

Figure 1.5.1

### Example 1.5.1

Name the decimal 4.3.

#### **Solution**

**Step 1: Name the number to the left of the decimal point.**

4 is to the left of the decimal point.

4.3  
four \_\_\_\_\_

**Step 2: Write 'and' for the decimal point.**

four and \_\_\_\_\_

**Step 3: Name the 'number' part to the right of the decimal point as if it were a whole number.**

3 is to the right of the decimal point.

four and three \_\_\_\_\_

**Step 4: Name the decimal place.**

Four and three tenths.

## Try It

1) Name the decimal: 6.7

**Solution**

Six and seven tenths.

2) Name the decimal: 5.8

**Solution**

Five and eight tenths.

We summarize the steps needed to name a decimal below.

## HOW TO

### Name a Decimal.

1. Name the number to the left of the decimal point.
2. Write “and” for the decimal point.
3. Name the “number” part to the right of the decimal point as if it were a whole number.
4. Name the decimal place of the last digit.

## Example 1.5.2

Name the decimal: -15.571

### **Solution**

**Step 1: Name the number to the left of the decimal point.**

negative fifteen \_\_\_\_\_

**Step 2: Write “and” for the decimal point.**

negative fifteen and \_\_\_\_\_

**Step 3: Name the number to the right of the decimal point.**

negative fifteen and five hundred seventy one \_\_\_\_\_

**Step 4: The 1 is in the thousandths place.**

Negative fifteen and five hundred seventy-one thousandths.

## Try It

3) Name the decimal: -13.461

### **Solution**

Negative thirteen and four hundred sixty-one thousandths.

4) Name the decimal: -2.053.

### **Solution**

Negative two and fifty-three thousandths.

When we write a check we write both the numerals and the name of the number. Let's see how to write the decimal from the name.

### Example 1.5.3

Write “fourteen and twenty-four thousandths” as a decimal.

#### Solution

**Step 1: Look for the word ‘and’; it locates the decimal point. Place a decimal point under the word ‘and’.**

Translate the words before ‘and’ into the whole number and place to the left of the decimal point.

Figure 1.5.2

**Step 2: Mark the number of decimal places needed to the right of the decimal point by noting the place value indicated by the last word.**

Figure 1.5.3

**Step 3: Translate the words after ‘and’ into the number to the right of the decimal point.**

Write the number in the spaces — putting the final digit in the last place.

$$14.\underline{\quad}\underline{\quad}\underline{\quad}\underline{2}\underline{4}$$

Figure 1.5.4

**Step 4: Fill in zeros for empty place holders as needed.**

Zeros are needed in the tenths place.

$$14.\underline{0}\underline{\quad}\underline{0}\underline{2}\underline{4}$$

Fourteen and twenty-four thousandths is written 14.024.

Figure 1.5.5

**Try It**

5) Write as a decimal: thirteen and sixty-eight thousandths.

**Solution**

13.68

6) Write as a decimal: five and ninety-four thousandths.

**Solution**

5.94

We summarize the steps to writing a decimal.

## HOW TO

### Write a decimal.

1. Look for the word “and”—it locates the decimal point.
  - Place a decimal point under the word “and.” Translate the words before “and” into the whole number and place it to the left of the decimal point.
  - If there is no “and,” write a “0” with a decimal point to its right.
2. Mark the number of decimal places needed to the right of the decimal point by noting the place value indicated by the last word.
3. Translate the words after “and” into the number to the right of the decimal point. Write the number in the spaces—putting the final digit in the last place.
4. Fill in zeros for place holders as needed.

## Round Decimals

Rounding decimals is very much like rounding whole numbers. We will round decimals with a method based on the one we used to round whole numbers.

### Example 1.5.4

Round 18.379 to the nearest hundredth.

#### **Solution**

**Step 1:** Locate the given place value and mark it with an arrow.

Figure 1.5.6

**Step 2: Underline the digit to the right of the given place value.**

Figure 1.5.7

**Step 3: Is this digit greater than or equal to 5?**

**Yes:** Add 1 to the digit in the given place value.

**No:** Do not change the digit in the given place value.

Figure 1.5.8

**Step 4: Rewrite the number, removing all digits to the right of the rounding digit.**

Figure 1.5.9

## Try It

7) Round to the nearest hundredth: 1.047

**Solution**

1.05

8) Round to the nearest hundredth: 9.173

**Solution**

9.17

We summarize the steps for rounding a decimal here.

## HOW TO

### Round Decimals.

1. Locate the given place value and mark it with an arrow.
2. Underline the digit to the right of the place value.
3. Is this digit greater than or equal to 5?
  - Yes—add 1 to the digit in the given place value.
  - No—do *not* change the digit in the given place value.
4. Rewrite the number, deleting all digits to the right of the rounding digit.

## Example 1.5.5

Round 18.379 to the nearest

- a. tenth
- b. whole number.

### Solution

Round 18.379

- a. to the nearest tenth

**Step 1: Locate the tenths place with an arrow.**

Figure 1.5.10

**Step 2: Underline the digit to the right of the given place value.**

Figure 1.5.11

**Step 3: Because 7 is greater than or equal to 5, add 1 to the 3.**

Figure 1.5.12

**Step 4: Rewrite the number, deleting all digits to the right of the rounding digit.**

18.4

**Step 5: Notice that the deleted digits were NOT replaced with zeros.**

So, 18.379 rounded to the nearest tenth is 18.4.

b. to the nearest whole number

**Step 1: Locate the ones place with an arrow.**

Figure 1.5.13

**Step 2: Underline the digit to the right of the given place value.**

Figure 1.5.14

**Step 3: Since 3 is not greater than or equal to 5, do not add 1 to the 8.**

Figure 1.5.15

**Step 4: Rewrite the number, deleting all digits to the right of the rounding digit.**

So, 18.379 rounded to the nearest whole number is 18.

## Try It

9) Round 6.582 to the nearest

- a. hundredth
- b. tenth
- c. whole number.

**Solution**

- a. 6.58
- b. 6.6
- c. 7

10) Round 15.2175 to the nearest

- a. thousandth
- b. hundredth
- c. tenth.

**Solution**

- a. 15.218
- b. 15.22
- c. 15.2

## Add and Subtract Decimals

To add or subtract decimals, we line up the decimal points. By lining up the decimal points this way, we can add or subtract the corresponding place values. We then add or subtract the numbers as if they were whole numbers and then place the decimal point in the sum.

## HOW TO

### Add or Subtract Decimals.

1. Write the numbers so the decimal points line up vertically.
2. Use zeros as place holders, as needed.
3. Add or subtract the numbers as if they were whole numbers. Then place the decimal point in the answer under the decimal points in the given numbers.

### Example 1.5.6

Add:  $23.5 + 41.38$

#### Solution

**Step 1:** Write the numbers so the decimal points line up vertically.

$$\begin{array}{r} 23.50 \\ +41.38 \\ \hline \end{array}$$

**Step 2:** Put 0 as a placeholder after the 5 in 23.5. Remember,  $\frac{5}{10} = \frac{50}{100}$  so,  $0.5 = 0.50$ .

$$\begin{array}{r} 23.50 \\ +41.38 \\ \hline \end{array}$$

**Step 3:** Add the numbers as if they were whole numbers. Then place the decimal point in the sum.

$$\begin{array}{r} 23.50 \\ +41.38 \\ \hline 64.88 \end{array}$$

## Try It

11) Add:  $4.8 + 11.69$

**Solution**

16.49

12) Add:  $5.123 + 18.47$

**Solution**

23.593

## Example 1.5.7

Subtract:  $20 - 14.65$

**Solution**

**Step 1:** Write the numbers so the decimal points line up vertically.

$$\begin{array}{r} 20. \\ -14.65 \\ \hline \end{array}$$

**Step 2:** Put in zeros to the right as placeholders.

Remember, 20 is a whole number, so place the decimal point after the 0.

$$\begin{array}{r} 20.00 \\ -14.65 \\ \hline \end{array}$$

**Step 3:** Subtract and place the decimal point in the answer.

$$\begin{array}{r} 20.00 \\ -14.65 \\ \hline 5.35 \end{array}$$

## Try It

13) Subtract  $10 - 9.58$ .

**Solution**

0.42

14) Subtract:  $50 - 37.42$ .

**Solution**

12.58

## Multiply and Divide Decimals

Multiplying decimals is very much like multiplying whole numbers—we just have to determine where to place the decimal point. The procedure for multiplying decimals will make sense if we first convert them to fractions and then multiply.

So let's see what we would get as the product of decimals by converting them to fractions first. We will do two examples side-by-side. Look for a pattern!

---

	$(0.\overbrace{3})$ 1 place	$(0.\overbrace{7})$ 1 place	$(0.\overbrace{2})$ 1 place	$(0.\overbrace{46})$ 2 places
Convert to fractions.	$\frac{3}{10} \cdot \frac{7}{10}$		$\frac{2}{10} \cdot \frac{46}{100}$	
Multiply.	$\frac{21}{100}$		$\frac{92}{1000}$	
Convert to decimals.	$(0.\overbrace{21})$ 2 places		$(0.\overbrace{096})$ 3 places	

---

Notice, in the first example, we multiplied two numbers that each had one digit after the decimal point and the product had two decimal places. In the second example, we multiplied a number with one decimal place by a number with two decimal places and the product had three decimal places.

We multiply the numbers just as we do whole numbers, temporarily ignoring the decimal point. We then count the number of decimal points in the factors and that sum tells us the number of decimal places in the product.

The rules for multiplying positive and negative numbers apply to decimals, too, of course!

### **When *multiplying* two numbers,**

- if their signs are the *same* the product is *positive*.
- if their signs are *different* the product is *negative*.

When we multiply signed decimals, first we determine the sign of the product and then multiply as if the numbers were both positive. Finally, we write the product with the appropriate sign.

## HOW TO

### Multiply Decimals

1. Determine the sign of the product.
2. Write in vertical format, lining up the numbers on the right. Multiply the numbers as if they were whole numbers, temporarily ignoring the decimal points.
3. Place the decimal point. The number of decimal places in the product is the sum of the number of decimal places in the factors.
4. Write the product with the appropriate sign.

### Example 1.5.8

Multiply:  $(-3.9)(4.075)$

#### Solution

**Step 1:** The signs are different. The product will be negative.

**Step 2:** Write in vertical format, lining up the numbers on the right.

$$\begin{array}{r} 4.075 \\ \times 3.9 \\ \hline \end{array}$$

**Step 3:** Multiply.

$$\begin{array}{r} 4.075 \\ \times 3.9 \\ \hline 158925 \end{array}$$

**Step 4:** Add the number of decimal places in the factors  $(1 + 3)$ .

$$\begin{array}{cc} (-3. \underbrace{9}) & (4. \underbrace{075}) \\ 1 \text{ place} & 3 \text{ places} \end{array}$$

**Step 5: Place the decimal point 4 places from the right.**

$$\begin{array}{r} 4.075 \\ \times 3.9 \\ \hline 15.8925 \\ \underbrace{\hspace{1.5cm}} \\ 4 \text{ places} \end{array}$$

**Step 6: The signs are different, so the product is negative.**

$$(-3.9)(4.075) = -15.8925$$

## Try It

15) Multiply:  $-4.5(6.107)$

**Solution**

-27.4815

16) Multiply:  $-10.79(8.12)$

**Solution**

-87.6148

In many of your other classes, especially in the sciences, you will multiply decimals by powers of 10 (10, 100, 1000, etc.). If you multiply a few products on paper, you may notice a pattern relating the number of zeros in the power of 10 to number of decimal places we move the decimal point to the right to get the product.

## HOW TO

### Multiply a Decimal by a Power of Ten

1. Move the decimal point to the right the same number of places as the number of zeros in the power of 10.
2. Add zeros at the end of the number as needed.

### Example 1.5.9

Multiply 5.63

- a. by 10
- b. by 100
- c. by 1,000

#### Solution

By looking at the number of zeros in the multiple of ten, we see the number of places we need to move the decimal to the right.

a.

**Step 1:** There is 1 zero in 10, so move the decimal point 1 place to the right.

$$5.63(10)$$

$$\begin{array}{r} 5.63 \\ \downarrow \\ 56.3 \end{array}$$

Fig.  
1.5.16

b.

**Step 1:** There are 2 zeros in 100, so move the decimal point 2 places to the right.

$$5.63(100)$$

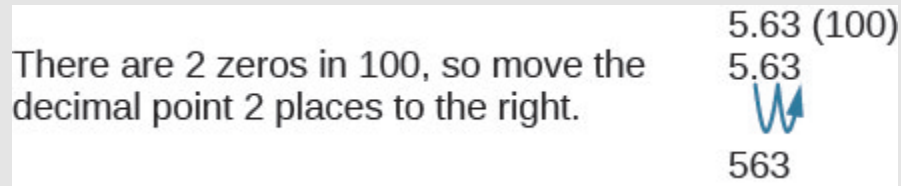

Figure 1.5.17

c.

**Step 1:** There are 3 zeros in 1,000, so move the decimal point 3 places to the right.

$$5.63(1000)$$

Figure  
1.5.18

**Step 2:** A zero must be added at the end.

$$5,630$$

## Try It

17) Multiply 2.58

a. by 10

- b. by 100
- c. by 1,000

**Solution**

- a. 25.8
- b. 258
- c. 2,580

18) Multiply 14.2

- a. by 10
- b. by 100
- c. by 1,000

**Solution**

- a. 142
- b. 1,420
- c. 14,200

Just as with multiplication, division of decimals is very much like dividing whole numbers. We just have to figure out where the decimal point must be placed.

To divide decimals, determine what power of 10 to multiply the denominator by to make it a whole number. Then multiply the numerator by that same power of 10. Because of the equivalent fractions property, we haven't changed the value of the fraction! The effect is to move the decimal points in the numerator and denominator the same number of places to the right. For example:

$$\begin{array}{r} 0.8 \\ \hline 0.4 \\ 0.8(10) \\ \hline 0.4(10) \\ 8 \\ \hline 4 \end{array}$$

We use the rules for dividing positive and negative numbers with decimals, too. When dividing signed decimals, first determine the sign of the quotient and then divide as if the numbers were both positive. Finally, write the quotient with the appropriate sign.

We review the notation and vocabulary for division:

$$\begin{array}{ccccc} a & \div & b & = & c \\ \text{dividend} & & \text{divisor} & & \text{quotient} \end{array}$$

$$\begin{array}{r} \text{quotient } c \\ b \overline{) a} \\ \text{divisor } b \end{array}$$

Figure 1.5.19

We'll write the steps to take when dividing decimals, for easy reference.

## HOW TO

### Divide Decimals.

1. Determine the sign of the quotient.
2. Make the divisor a whole number by “moving” the decimal point all the way to the right. “Move” the decimal point in the dividend the same number of places—adding zeros as needed.
3. Divide. Place the decimal point in the quotient above the decimal point in the dividend.
4. Write the quotient with the appropriate sign.

### Example 1.5.10

Divide:  $-25.56 \div (-0.06)$

#### Solution

Remember, you can “move” the decimals in the divisor and dividend because of the Equivalent Fractions Property.

#### Step 1: The signs are the same.

The quotient is positive.

**Step 2:** Make the divisor a whole number by “moving” the decimal point all the way to the right.

**Step 3:** “Move” the decimal point in the dividend the same number of places.

$$0.06 \overline{)25.65}$$

Figure 1.5.20

**Step 4: Divide.**

Place the decimal point in the quotient above the decimal point in the dividend.

$$\begin{array}{r} 427.5 \\ 006 \overline{)2565.0} \\ \underline{-24} \phantom{0} \\ 16 \phantom{0} \\ \underline{-12} \phantom{0} \\ 45 \phantom{0} \\ \underline{-42} \phantom{0} \\ 30 \phantom{0} \\ \underline{30} \phantom{0} \end{array}$$

Figure 1.5.21

**Step 5:** Write the quotient with the appropriate sign.

$$-25.65 \div (-0.06) = 427.5$$

## Try It

19) Divide:  $-23.492 \div (-0.04)$

**Solution**

687.3

20) Divide:  $-4.11 \div (-0.12)$

**Solution**

34.25

A common application of dividing whole numbers into decimals is when we want to find the price of one item that is sold as part of a multi-pack. For example, suppose a case of 24 water bottles costs \$3.99. To find the price of one water bottle, we would divide \$3.99 by 24. We show this division in Example 1.5.13. In calculations with money, we will round the answer to the nearest cent (hundredth).

**Example 1.5.11**

Divide:  $\$3.99 \div 24$ .

**Solution**

**Step 1:** Place the decimal point in the quotient above the decimal point in the dividend.

**Step 2:** Divide as usual.

When do we stop? Since this division involves money, we round it to the nearest cent (hundredth.) To do this, we must carry the division to the thousandths place.

$$\begin{array}{r} 0.166 \\ 24 \overline{) 3.990} \\ \underline{24} \phantom{0} \\ 159 \phantom{0} \\ \underline{144} \phantom{0} \\ 150 \phantom{0} \\ \underline{144} \phantom{0} \\ 6 \end{array}$$

Figure  
1.5.22

**Step 3:** Round to the nearest cent.

$$\begin{aligned} 0.166 &\approx 0.17 \\ \$3.99 \div 24 &\approx \$0.17 \end{aligned}$$

## Try It

21) Divide:  $\$6.99 \div 36$

**Solution**

0.19

22) Divide:  $\$4.99 \div 12$

**Solution**

0.42

## Convert Decimals, Fractions, and Percents

We convert decimals into fractions by identifying the place value of the last (farthest right) digit. In the decimal 0.03 the 3 is in the hundredths place, so 100 is the denominator of the fraction equivalent to 0.03.

$$0.03 = \frac{3}{100}$$

Notice, when the number to the left of the decimal is zero, we get a fraction whose numerator is less than its denominator. Fractions like this are called proper fractions.

The steps to take to convert a decimal to a fraction are summarized in the procedure box.

### HOW TO

#### Convert a Decimal to a Proper Fraction.

1. Determine the place value of the final digit.
2. Write the fraction.

- numerator—the “numbers” to the right of the decimal point
- denominator—the place value corresponding to the final digit

### Example 1.5.12

Write 0.374 as a fraction.

#### Solution

**Step 1: Determine the place value of the final digit.**

Figure 1.5.23

**Step 2: Write the fraction for 0.374:**

- The numerator is 374.
- The denominator is 1,000.

$$\frac{374}{1000}$$

**Step 3: Simplify the fraction.**

$$\frac{2 \times 187}{2 \times 500}$$

**Step 4: Divide out the common factors.**

$$\frac{187}{500}$$

$$\text{So, } 0.374 = \frac{187}{500}.$$

---

Did you notice that the number of zeros in the denominator of  $\frac{374}{1,000}$  is the same as the number of decimal places in **0.374**?

## Try It

23) Write **0.234** as a fraction.

**Solution**

$$\frac{117}{500}$$

24) Write **0.024** as a fraction.

**Solution**

$$\frac{3}{125}$$

We've learned to convert decimals to fractions. Now we will do the reverse—convert fractions to decimals. Remember that the fraction bar means division. So  $\frac{4}{5}$  can be written  $4 \div 5$  or  $5 \overline{)4}$ . This leads to the following method for converting a fraction to a decimal.

## HOW TO

### Convert a Fraction to a Decimal.

To convert a fraction to a decimal, divide the numerator of the fraction by the denominator of the fraction.

### Example 1.5.13

Write  $\frac{5}{8}$  as a decimal.

#### Solution

**Step 1:** Since a fraction bar means division, we begin by writing  $\frac{5}{8}$  as  $8 \overline{)5}$

**Step 2:** Now divide.

$$\begin{array}{r} 0.625 \\ 8 \overline{)5.000} \\ \underline{48} \phantom{00} \\ 20 \phantom{00} \\ \underline{16} \phantom{00} \\ 40 \phantom{00} \\ \underline{40} \phantom{00} \\ 0 \end{array}$$

so,  $-\frac{5}{8} = -0.625$

Figure 1.5.24

### Try It

25) Write  $\frac{-7}{8}$  as a decimal.

#### Solution

$-0.875$

26) Write  $\frac{-3}{8}$  as a decimal.

**Solution**

$-0.375$

When we divide, we will not always get a zero remainder. Sometimes the quotient ends up with a decimal that repeats. A **repeating decimal** is a decimal in which the last digit or group of digits repeats endlessly. A bar is placed over the repeating block of digits to indicate it repeats.

## Repeating Decimal

A **repeating decimal** is a decimal in which the last digit or group of digits repeats endlessly.

A bar is placed over the repeating block of digits to indicate it repeats.

### Example 1.5.14

Write  $\frac{43}{22}$  as a decimal.

**Solution**

Divide 43 by 22.

$$\begin{array}{r}
 43 \\
 \hline
 22 \overline{) 43.00000} \\
 \underline{22} \phantom{00000} \\
 210 \phantom{0000} \\
 \underline{198} \phantom{000} \\
 120 \phantom{00} \leftarrow 120 \text{ repeats} \\
 \underline{110} \phantom{0} \\
 100 \phantom{0} \leftarrow 100 \text{ repeats} \\
 \underline{88} \phantom{0} \\
 120 \phantom{0} \\
 \underline{110} \phantom{0} \\
 100 \phantom{0} \\
 \underline{88} \phantom{0} \\
 \dots
 \end{array}$$

The pattern repeats, so the numbers in the quotient will repeat as well.

so,  $\frac{43}{22} = 1.9\overline{54}$

Figure 1.5.25

## Try It

27) Write  $\frac{27}{11}$  as a decimal.

**Solution**

$2.\overline{45}$

28) Write  $\frac{51}{22}$  as a decimal.

**Solution**

$2.3\overline{18}$

Sometimes we may have to simplify expressions with fractions and decimals together.

### Example 1.5.15

Simplify:  $\frac{7}{8} + 6.4$

#### Solution

First we must change one number so both numbers are in the same form. We can change the fraction to a decimal, or change the decimal to a fraction. Usually it is easier to change the fraction to a decimal.

**Step 1: Change  $\frac{7}{8}$  to a decimal.**

$$\begin{array}{r} 0.875 \\ 8 \overline{)7.000} \\ \underline{64} \phantom{00} \\ 60 \phantom{0} \\ \underline{56} \phantom{0} \\ 40 \\ \underline{40} \\ 0 \end{array}$$

Figure  
1.5.26

**Step 2: Add.**

$$0.875 + 6.4 = 7.275$$

$$\text{So, } \frac{7}{8} + 6.4 = 7.275$$

## Try It

29) Simplify:  $\frac{3}{8} + 4.9$

**Solution**

5.275

30) Simplify:  $5.7 + \frac{13}{20}$

**Solution**

6.35

A **percent** is a ratio whose denominator is 100. Percent means per hundred. We use the percent symbol, %, to show percent.

## Percent

A percent is a ratio whose denominator is 100.

Since a percent is a ratio, it can easily be expressed as a fraction. Percent means per 100, so the denominator of the fraction is 100. We then change the fraction to a decimal by dividing the numerator by the denominator.

	6%	78%	135%
Write as a ratio with denominator 100.	$\frac{6}{100}$	$\frac{78}{100}$	$\frac{135}{100}$
Change the fraction to a decimal by dividing the numerator by the denominator.	0.06	0.78	1.35

Do you see the pattern? *To convert a percent number to a decimal number, we move the decimal point two places to the left.*

Figure 1.5.27

### Example 1.5.16

Convert each percent to a decimal:

- a. 62%
- b. 135%
- c. 35.7%

#### Solution

a.

**Step 1: Move the decimal point two places to the left.**

Figure 1.5.28

0.62

b.

**Step 1: Move the decimal point two places to the left.**

Figure 1.5.29

## Try It

31) Convert each percent to a decimal:

- a. 9%
- b. 87%
- c. 3.9%

**Solution**

- a. 0.09
- b. 0.87
- c. 0.039

32) Convert each percent to a decimal:

- a. 3%
- b. 91%
- c. 8.3%

**Solution**

- a. 0.03
- b. 0.91
- c. 0.083

Converting a decimal to a percent makes sense if we remember the definition of percent and keep place value in mind.

To convert a decimal to a percent, remember that percent means per hundred. If we change the decimal to a fraction whose denominator is 100, it is easy to change that fraction to a percent.

	0.83	1.05	0.075
Write as a fraction.	$\frac{83}{100}$	$\frac{5}{100}$	$\frac{75}{1000}$
The denominator is 100.		$\frac{105}{100}$	$\frac{7.5}{100}$
Write the ratio as a percent.	83%	105%	7.5%

Recognize the pattern? *To convert a decimal to a percent, we move the decimal point two places to the right and then add the percent sign.*

0.05	0.83	1.05	0.075	0.3
				
5%	83%	105%	7.5%	30%

Figure 1.5.31

### Example 1.5.17

Convert each decimal to a percent:

- a. 0.51
- b. 1.25
- c. 0.093

**Solution**

a.

**Step 1: Move the decimal point two places to the right.**Figure

## Try It

33) Convert each decimal to a percent:

- a. **0.17**
- b. 1.75
- c. **0.0825**

**Solution**

- a. 17%
- b. 175%
- c. **8.25%**

34) Convert each decimal to a percent:

- a. 0.41
- b. **2.25**
- c. **0.0925**

**Solution**

- a. 41%
- b. **225%**
- c. **9.25%**

## Key Concepts

- **Name a Decimal**

1. Name the number to the left of the decimal point.
2. Write "and" for the decimal point.

3. Name the “number” part to the right of the decimal point as if it were a whole number.
4. Name the decimal place of the last digit.

- **Write a Decimal**

1. Look for the word ‘and’—it locates the decimal point. Place a decimal point under the word ‘and.’ Translate the words before ‘and’ into the whole number and place it to the left of the decimal point. If there is no “and,” write a “0” with a decimal point to its right.
2. Mark the number of decimal places needed to the right of the decimal point by noting the place value indicated by the last word.
3. Translate the words after ‘and’ into the number to the right of the decimal point. Write the number in the spaces—putting the final digit in the last place.
4. Fill in zeros for place holders as needed.

- **Round a Decimal**

1. Locate the given place value and mark it with an arrow.
2. Underline the digit to the right of the place value.
3. Is this digit greater than or equal to 5? Yes—add 1 to the digit in the given place value. No—do *not* change the digit in the given place value.
4. Rewrite the number, deleting all digits to the right of the rounding digit.

- **Add or Subtract Decimals**

1. Write the numbers so the decimal points line up vertically.
2. Use zeros as place holders, as needed.
3. Add or subtract the numbers as if they were whole numbers. Then place the decimal in the answer under the decimal points in the given numbers.

- **Multiply Decimals**

1. Determine the sign of the product.
2. Write in vertical format, lining up the numbers on the right. Multiply the numbers as if they were whole numbers, temporarily ignoring the decimal points.
3. Place the decimal point. The number of decimal places in the product is the sum of the decimal places in the factors.
4. Write the product with the appropriate sign.

- **Multiply a Decimal by a Power of Ten**

1. Move the decimal point to the right the same number of places as the number of zeros in the power of 10.
2. Add zeros at the end of the number as needed.

- **Divide Decimals**

1. Determine the sign of the quotient.
2. Make the divisor a whole number by “moving” the decimal point all the way to the right. “Move” the decimal point in the dividend the same number of places – adding zeros as needed.
3. Divide. Place the decimal point in the quotient above the decimal point in the dividend.
4. Write the quotient with the appropriate sign.

- **Convert a Decimal to a Proper Fraction**

1. Determine the place value of the final digit.
2. Write the fraction: numerator—the ‘numbers’ to the right of the decimal point; denominator—the place value corresponding to the final digit.

- **Convert a Fraction to a Decimal** Divide the numerator of the fraction by the denominator

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=316#h5p-5>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## Glossary

**decimal**

A decimal is another way of writing a fraction whose denominator is a power of ten.

**percent**

A percent is a ratio whose denominator is 100.

**repeating decimal**

A repeating decimal is a decimal in which the last digit or group of digits repeats endlessly.

# 1.6 THE REAL NUMBERS

## Learning Objectives

By the end of this section, you will be able to:

- Simplify expressions with square roots
- Identify integers, rational numbers, irrational numbers, and real numbers
- Locate fractions on the number line
- Locate decimals on the number line

## Simplify Expressions with Square Roots

Remember that when a number  $n$  is multiplied by itself, we write  $n^2$  and read it “n squared.” The result is called the square of  $n$ . For example,

$8^2$  read \text{8 squared}

64 is called the square of 8

Similarly, 121 is the square of 11, because  $11^2$  is 121.

### Square of a Number

If  $n^2 = m$ , then  $m$  is the square of  $n$ .

Complete the following table to show the squares of the counting numbers 1 through 15.

Number	$n$	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15
Square	$n^2$								64			121				

The numbers in the second row are called perfect square numbers. It will be helpful to learn to recognize the perfect square numbers.

The squares of the counting numbers are positive numbers. What about the squares of negative numbers? We know that when the signs of two numbers are the same, their product is positive. So the square of any negative number is also positive.

$$(-3)^2 = 9 \quad (-8)^2 = 64 \quad (-11)^2 = 121 \quad (-15)^2 = 225$$

Did you notice that these squares are the same as the squares of the positive numbers?

Sometimes we will need to look at the relationship between numbers and their squares in reverse. Because  $10^2 = 100$ , we say 100 is the square of 10. We also say that 10 is a square root of 100. A number whose square is  $m$  is called a **square root** of  $m$ .

## Square Root of a Number

If  $n^2 = m$ , then  $n$  is a square root of  $m$ .

Notice  $(-10)^2 = 100$  also, so  $-10$  is also a square root of 100. Therefore, both 10 and  $-10$  are square roots of 100.

So, every positive number has two square roots—one positive and one negative. What if we only wanted the positive square root of a positive number? The **radical sign**,  $\sqrt{m}$ , denotes the positive square root. The positive square root is called the principal square root. When we use the radical sign that always means we want the principal square root.

We also use the radical sign for the square root of zero. Because  $0^2 = 0$ ,  $\sqrt{0} = 0$ . Notice that zero has only one square root.

## Square Root Notation

$\sqrt{m}$  is read “the square root of  $m$ ”

*radical sign*  $\rightarrow \sqrt{m} \leftarrow$  *radicand*

If  $m = n^2$ , then  $\sqrt{m} = n$ , for  $n \geq 0$ .

The square root of  $m$ ,  $\sqrt{m}$ , is the positive number whose square is  $m$ .

Since 10 is the principal square root of 100, we write  $\sqrt{100} = 10$ . You may want to complete the following table to help you recognize square roots.

---

$\sqrt{1}$	$\sqrt{4}$	$\sqrt{9}$	$\sqrt{16}$	$\sqrt{25}$	$\sqrt{36}$	$\sqrt{49}$	$\sqrt{64}$	$\sqrt{81}$	$\sqrt{100}$	$\sqrt{121}$	$\sqrt{144}$	$\sqrt{169}$	$\sqrt{196}$	$\sqrt{225}$
------------	------------	------------	-------------	-------------	-------------	-------------	-------------	-------------	--------------	--------------	--------------	--------------	--------------	--------------

---

10

---

## Try It

Simplify:

1)  $\sqrt{25}$

2)  $\sqrt{121}$

### Solution

1) Since  $5^2 = 25$

$\sqrt{25} = 5$

2) Since  $11^2 = 121$

$\sqrt{121} = 11$

## Try It

Simplify:

3)  $\sqrt{36}$

4)  $\sqrt{169}$

**Solution**

3) 6

4) 13

## Try It

Simplify:

5)  $\sqrt{16}$

6)  $\sqrt{196}$

**Solution**

5) 4

6) 14

We know that every positive number has two square roots and the radical sign indicates the positive one. We write  $\sqrt{100} = 10$ . If we want to find the negative square root of a number, we place a negative in front of the radical sign. For example,  $-\sqrt{100} = -10$ . We read  $-\sqrt{100}$  as “the opposite of the square root of 10.”

## Try It

Simplify:

7)  $-\sqrt{9}$

8)  $-\sqrt{144}$

### Solution

7) The negative is in front of the radical sign.  $-\sqrt{9} = -3$

8) The negative is in front of the radical sign.  $-\sqrt{144} = -12$

## Try It

Simplify:

9)  $-\sqrt{4}$

10)  $-\sqrt{225}$

### Solution

9)  $-2$

10)  $-15$

## Try It

Simplify:

11)  $-\sqrt{81}$

12)  $-\sqrt{100}$

### Solution

11)  $-9$

12)  $-10$

## Identify Integers, Rational Numbers, Irrational Numbers, and Real Numbers

We have already described numbers as *counting numbers*, *whole numbers*, and *integers*. What is the difference between these types of numbers?

Counting numbers                       $1, 2, 3, 4, \dots$

Whole numbers                           $0, 1, 2, 3, 4, \dots$

Integers                                   $\dots - 3, -2, -1, 0, 1, 2, 3, \dots$

What type of numbers would we get if we started with all the integers and then included all the fractions? The numbers we would have form the set of rational numbers. A rational number is a number that can be written as a ratio of two integers.

### Rational Number

A rational number is a number of the form  $\frac{p}{q}$ , where  $p$  and  $q$  are integers and  $q \neq 0$ .

A rational number can be written as the ratio of two integers.

All signed fractions, such as  $\frac{4}{5}$ ,  $-\frac{7}{8}$ ,  $\frac{13}{4}$ ,  $-\frac{20}{3}$  are rational numbers. Each numerator and each denominator is an integer.

Are integers rational numbers? To decide if an integer is a rational number, we try to write it as a ratio of two integers. Each integer can be written as a ratio of integers in many ways. For example, 3 is equivalent to

$$\frac{3}{1}, \frac{6}{2}, \frac{9}{3}, \frac{12}{4}, \frac{15}{5}, \dots$$

An easy way to write an integer as a ratio of integers is to write it as a fraction with denominator one.

$$3 = \frac{3}{1} \qquad -8 = -\frac{8}{1} \qquad 0 = \frac{0}{1}$$

Since any integer can be written as the ratio of two integers, all integers are rational numbers! Remember that the counting numbers and the whole numbers are also integers, and so they, too, are rational.

What about decimals? Are they rational? Let's look at a few to see if we can write each of them as the ratio of two integers.

We've already seen that integers are rational numbers. The integer  $-8$  could be written as the decimal  $-8.0$ . So, clearly, some decimals are rational.

Think about the decimal 7.3. Can we write it as a ratio of two integers? Because 7.3 means  $7\frac{3}{10}$ , we can write it as an improper fraction,  $\frac{73}{10}$ . So 7.3 is the ratio of the integers 73 and 10. It is a rational number.

In general, any decimal that ends after a number of digits (such as **7.3** or **-1.2684**) is a rational number. We can use the place value of the last digit as the denominator when writing the decimal as a fraction.

### Example 1.6.1

Write as the ratio of two integers:

- a.  $-27$
- b.  $7.31$

#### Solution

a.

**Step 1: Write it as a fraction with denominator 1.**

$$-27 = \frac{-27}{1}$$

---

b.

**Step 1: Write it as a mixed number.**

Remember, 7 is the whole number and the decimal part, 0.31, indicates hundredths.

$$7\frac{31}{100}$$

**Step 2: Convert to an improper fraction.**

$$\frac{731}{100}$$

So we see that  $-27$  and  $7.31$  are both rational numbers, since they can be written as the ratio of two integers.

## Try It

Write as the ratio of two integers:

13)  $-24$

14)  $3.57$

**Solution**

13)  $\frac{-24}{1}$

14)  $\frac{357}{100}$

## Try It

Write as the ratio of two integers:

15)  $-19$

16)  $8.41$

**Solution**

15)  $\frac{-19}{1}$

16)  $\frac{841}{100}$

Let's look at the decimal form of the numbers we know are rational.

We have seen that *every integer is a rational number*, since  $a = \frac{a}{1}$  for any integer,  $a$ . We can also change any integer to a decimal by adding a decimal point and a zero.

Integer	$-2$	$-1$	$0$	$1$	$2$	$3$
Decimal form	$-2.0$	$-1.0$	$0.0$	$1.0$	$2.0$	$3.0$

These decimal numbers stop.

We have also seen that *every fraction is a rational number*. Look at the decimal form of the fractions we considered above.

Ratio of integers	$\frac{4}{5}$	$-\frac{7}{8}$	$\frac{13}{4}$	$-\frac{20}{3}$
The decimal form	$0.8$	$-0.875$	$3.25$	$-6.666\dots$ $-6.\bar{6}$

These decimals either stop or repeat.

What do these examples tell us?

Every rational number can be written both as a ratio of integers,  $\frac{p}{q}$ , where  $p$  and  $q$  are integers and  $q \neq 0$ , and as a decimal that either stops or repeats.

Here are the numbers we looked at above expressed as a ratio of integers and as a decimal:

	Fractions		Integers							
Number	$\frac{4}{5}$	$-\frac{7}{8}$	$\frac{13}{4}$	$-\frac{20}{3}$	$-2$	$-1$	$0$	$1$	$2$	$3$
Ratio of Integers	$\frac{4}{5}$	$-\frac{7}{8}$	$\frac{13}{4}$	$-\frac{20}{3}$	$-\frac{2}{1}$	$-\frac{1}{1}$	$\frac{0}{1}$	$\frac{1}{1}$	$\frac{2}{1}$	$\frac{3}{1}$
Decimal Form	0.8	-0.875	3.25	$-6.\bar{6}$	-2.0	-1.0	0.0	1.0	2.0	3.0

### Rational Number

A rational number is a number of the form  $\frac{p}{q}$ , where  $p$  and  $q$  are integers and  $q \neq 0$ .

Its decimal form stops or repeats.

Are there any decimals that do not stop or repeat? Yes!

The number  $\pi$  (the Greek letter pi, pronounced “pie”), which is very important in describing circles, has a decimal form that does not stop or repeat.

$$\pi = 3.141592654\dots$$

We can even create a decimal pattern that does not stop or repeat, such as

$$2.01001000100001\dots$$

Numbers whose decimal form does not stop or repeat cannot be written as a fraction of integers. We call these numbers **irrational**.

## Irrational Number

An irrational number is a number that cannot be written as the ratio of two integers. Its decimal form does not stop and does not repeat.

Let's summarize a method we can use to determine whether a number is rational or irrational.

## Rational or Irrational?

If the decimal form of a number

- *repeats or stops*, the number is *rational*.
- *does not repeat and does not stop*, the number is *irrational*.

### Example 1.6.2

Given the numbers  $0.58\bar{3}$ ,  $0.47$ ,  $3.605551275\dots$  list the

- rational numbers
- irrational numbers

#### Solution

a.

**Step 1: Look for decimals that repeat or stop.**

The  $\bar{3}$  repeats in  $0.58\bar{3}$ .

The decimal  $0.\underline{47}$  stops after the 7.

So  $0.58\bar{3}$  and  $0.\underline{47}$  are rational.

b.

**Step 1: Look for decimals that repeat or stop.**

$3.605551275\dots$  has no repeating block of digits and it does not stop.

So  $3.605551275\dots$  is irrational.

## Try It

For the given numbers list the:

17) rational numbers

18) irrational numbers

$0.29$ ,  $0.81\bar{6}$ ,  $2.515115111\dots$

**Solution**

17)  $0.29$ ,  $0.81\bar{6}$

18)  $2.515115111\dots$

## Try It

For the given numbers list the:

- 19) rational numbers
- 20) irrational numbers

$2.\overline{63}$ ,  $0.125$ ,  $0.418302\dots$

### Solution

- 19)  $2.\overline{63}$ ,  $0.125$
- 20)  $0.418302\dots$

## Try It

For each number given, identify whether it is rational or irrational:

- 21)  $\sqrt{36}$
- 22)  $\sqrt{44}$

### Solution

- 21) Recognize that  $36$  is a perfect square, since  $6^2 = 36$ . So  $\sqrt{36} = 6$ , therefore  $\sqrt{36}$  is rational.
- 22) Remember that  $6^2 = 36$  and  $7^2 = 49$ , so  $44$  is not a perfect square. Therefore, the decimal form of  $\sqrt{44}$  will never repeat and never stop, so  $\sqrt{44}$  is irrational.

## Try It

For each number given, identify whether it is rational or irrational:

23)  $\sqrt{81}$

24)  $\sqrt{17}$

### **Solution**

23) rational

24) irrational

## Try It

For each number given, identify whether it is rational or irrational:

25)  $\sqrt{116}$

26)  $\sqrt{121}$

### **Solution**

25) irrational

26) rational

We have seen that all counting numbers are whole numbers, all whole numbers are integers, and all integers are rational numbers. The irrational numbers are numbers whose decimal form does not stop and does not repeat. When we put together the rational numbers and the irrational numbers, we get the set of **real numbers**.

## Real Number

A real number is a number that is either rational or irrational.

All the numbers we use in elementary algebra are real numbers. Figure 1.6.1 illustrates how the number sets we've discussed in this section fit together.

Figure 1.6.1. This chart shows the number sets that make up the set of real numbers. Does the term “real numbers” seem strange to you? Are there any numbers that are not “real,” and, if so, what could they be?

This chart shows the number sets that make up the set of real numbers. Does the term “real numbers” seem strange to you? Are there any numbers that are not “real,” and, if so, what could they be?

Can we simplify  $\sqrt{-25}$ ? Is there a number whose square is  $-25$ ?

$$(\quad)^2 = -25?$$

None of the numbers that we have dealt with so far has a square that is  $-25$ . Why? Any positive number squared is positive. Any negative number squared is positive. So we say there is no real number equal to  $\sqrt{-25}$ .

The square root of a negative number is not a real number.

## Try It

For each number given, identify whether it is a real number or not a real number:

27)  $\sqrt{-169}$

28)  $-\sqrt{64}$

### Solution

27) There is no real number whose square is  $-169$ . Therefore,  $\sqrt{-169}$  is not a real number.

28) Since the negative is in front of the radical,  $-\sqrt{64}$  is  $-8$ . Since  $-8$  is a real number,  $-\sqrt{64}$  is a real number.

## Try It

For each number given, identify whether it is a real number or not a real number:

29)  $\sqrt{-196}$

30)  $-\sqrt{81}$

### Solution

29) not a real number

30) real number

## Try It

For each number given, identify whether it is a real number or not a real number:

31)  $-\sqrt{49}$

32)  $\sqrt{-121}$

### Solution

31) real number

32) not a real number

## Example 1.6.3

Given the numbers  $-7$ ,  $\frac{14}{5}$ ,  $8$ ,  $\sqrt{5}$ ,  $5.9$ ,  $-\sqrt{64}$ , list the:

- whole numbers
- integers
- rational numbers
- irrational numbers
- real numbers

### Solution

a. Remember, the whole numbers are 0, 1, 2, 3, ... and 8 is the only whole number given.

---

b. The integers are the whole numbers, their opposites, and 0. So the whole number 8 is an integer,

and  $-7$  is the opposite of a whole number so it is an integer, too. Also, notice that 64 is the square of 8 so  $-\sqrt{64} = -8$ . So the integers are  $-7, 8, -\sqrt{64}$ .

---

c. Since all integers are rational, then  $-7, 8, -\sqrt{64}$  are rational. Rational numbers also include fractions and decimals that repeat or stop, so  $\frac{14}{5}$  and  $5.9$  are rational. So the list of rational numbers is  $-7, \frac{14}{5}, 8, 5.9, -\sqrt{64}$ .

---

d. Remember that 5 is not a perfect square, so  $\sqrt{5}$  is irrational.

---

e. All the numbers listed are real numbers.

## Try It

For the given numbers, list the:

33) whole numbers

34) integers

35) rational numbers

36) irrational numbers

37) real numbers

$-3, -\sqrt{2}, 0.\bar{3}, \frac{9}{5}, 4, \sqrt{49}$ .

## Solution

33)  $4, \sqrt{49}$

34)  $-3, 4, \sqrt{49}$

35)  $-3, 0.\bar{3}, \frac{9}{5}, 4, \sqrt{49}$

36)  $-\sqrt{2}$

37)  $-3, -\sqrt{2}, 0.\bar{3}, \frac{9}{5}, 4, \sqrt{49}$

## Try It

For the given numbers, list the:

38) whole numbers

39) integers

40) rational numbers

41) irrational numbers

42) real numbers

$$-\sqrt{25}, -\frac{3}{8}, -1, 6, \sqrt{121}, 2.041975\dots$$

### Solution

38)  $6, \sqrt{121}$

39)  $-\sqrt{25}, -1, 6, \sqrt{121}$

40)  $-\sqrt{25}, -\frac{3}{8}, -1, 6, \sqrt{121}$

41)  $2.041975\dots$

42)  $-\sqrt{25}, -\frac{3}{8}, -1, 6, \sqrt{121}, 2.041975\dots$

## Locate Fractions on the Number Line

The last time we looked at the number line, it only had positive and negative integers on it. We now want to include fractions and decimals on it.

Let's start with fractions and locate  $\frac{1}{5}$ ,  $-\frac{4}{5}$ ,  $3$ ,  $\frac{7}{4}$ ,  $-\frac{9}{2}$ ,  $-5$ , and  $\frac{8}{3}$  on the number line.

We'll start with the whole numbers  $3$  and  $-5$ , because they are the easiest to plot. See Figure 1.6.2

The proper fractions listed are  $\frac{1}{5}$  and  $-\frac{4}{5}$ . We know the proper fraction  $\frac{1}{5}$  has value less than one and so would be located between  $0$  and  $1$ . The denominator is  $5$ , so we divide the unit from  $0$  to  $1$  into  $5$  equal parts  $\frac{1}{5}$ ,  $\frac{2}{5}$ ,  $\frac{3}{5}$ ,  $\frac{4}{5}$ . We plot  $\frac{1}{5}$ . See Figure 1.6.2.

Similarly,  $-\frac{4}{5}$  is between  $0$  and  $-1$ . After dividing the unit into  $5$  equal parts we plot  $-\frac{4}{5}$ . See Figure 1.6.2

Finally, look at the improper fractions  $\frac{7}{4}$ ,  $-\frac{9}{2}$ ,  $\frac{8}{3}$ . These are fractions in which the numerator is greater than the denominator. Locating these points may be easier if you change each of them to a mixed number. See Figure 1.6.2.

$$\frac{7}{4} = 1\frac{3}{4} \qquad -\frac{9}{2} = -4\frac{1}{2} \qquad \frac{8}{3} = 2\frac{2}{3}$$

Figure 1.6.2 shows the number line with all the points plotted.

Figure 1.6.2

### Example 1.6.4

Locate and label the following on a number line:  $4$ ,  $\frac{3}{4}$ ,  $-\frac{1}{4}$ ,  $-3$ ,  $\frac{6}{5}$ ,  $-\frac{5}{2}$ , and  $\frac{7}{3}$ .

**Solution**

Locate and plot the integers, 4,  $-3$

**Step 1: Locate the proper fraction  $\frac{3}{4}$  first.**

The fraction  $\frac{3}{4}$  is between 0 and 1.

**Step 2: Divide the distance between 0 and 1 into four equal parts then, we plot  $\frac{3}{4}$ .**

Similarly plot  $-\frac{1}{4}$ .

**Step 3: Now locate the improper fractions  $\frac{6}{5}$ ,  $-\frac{5}{2}$ ,  $\frac{7}{3}$ .**

$$\begin{aligned}\frac{6}{5} &= 1\frac{1}{5} \\ -\frac{5}{2} &= -2\frac{1}{2} \\ \frac{7}{3} &= 2\frac{1}{3}\end{aligned}$$

It is easier to plot them if we convert them to mixed numbers and then plot them as described above:

Figure 1.6.3

## Try It

43) Locate and label the following on a number line:  $-1$ ,  $\frac{1}{3}$ ,  $\frac{6}{5}$ ,  $-\frac{7}{4}$ ,  $\frac{9}{2}$ ,  $5$ ,  $-\frac{8}{3}$ .

**Solution**

Figure 1.6.4

## Try It

44) Locate and label the following on a number line:  $-2$ ,  $\frac{2}{3}$ ,  $\frac{7}{5}$ ,  $-\frac{7}{4}$ ,  $\frac{7}{2}$ ,  $3$ ,  $-\frac{7}{3}$ .

### Solution

Figure 1.6.5

In Example 1.6.5, we'll use the inequality symbols to order fractions. In previous chapters we used the number line to order numbers.

- $a < b$  “ $a$  is less than  $b$ ” when  $a$  is to the left of  $b$  on the number line
- $a > b$  “ $a$  is greater than  $b$ ” when  $a$  is to the right of  $b$  on the number line

As we move from left to right on a number line, the values increase.

### Example 1.6.5

Order each of the following pairs of numbers, using  $<$  or  $>$ . It may be helpful to refer Figure 1.6.6.

- a.  $-\frac{2}{3}$  \_\_\_\_  $-1$
- b.  $-3\frac{1}{2}$  \_\_\_\_  $-3$
- c.  $-\frac{3}{4}$  \_\_\_\_  $-\frac{1}{4}$
- d.  $-2$  \_\_\_\_  $-\frac{8}{3}$

Figure 1.6.6

#### Solution

a.

**Step 1:**  $-\frac{2}{3}$  is to the right of  $-1$  on the number line.

$$-\frac{2}{3} \text{ ____ } -1 = -\frac{2}{3} > -1$$

---

b.

**Step 1:**  $-3\frac{1}{2}$  is to the right of  $-3$  on the number line.

$$-3\frac{1}{2} \text{ ____ } -3 = -3\frac{1}{2} < -3$$

---

c.

**Step 1:**  $-\frac{3}{4}$  is to the right of  $-\frac{1}{4}$  on the number line.

$$-\frac{3}{4} \text{ — } -\frac{1}{4} = -\frac{3}{4} < -\frac{1}{4}$$

---

d.

**Step 1:**  $-2$  is to the right of  $-\frac{8}{3}$  on the number line.

$$-2 \text{ — } -\frac{8}{3} = -2 > -\frac{8}{3}$$

## Try It

Order each of the following pairs of numbers, using  $<$  or  $>$ :

45)  $-\frac{1}{3}$  —  $-1$

46)  $-1\frac{1}{2}$  —  $-2$

47)  $-\frac{2}{3}$  —  $-\frac{1}{3}$

48)  $-3$  —  $-\frac{7}{3}$

### Solution

45)  $>$

46)  $>$

47)  $<$

48)  $<$

## Try It

Order each of the following pairs of numbers, using  $<$  or  $>$ :

$$49) -1\frac{\quad}{\quad} - \frac{2}{3}$$

$$50) -2\frac{1}{4} - 2$$

$$51) -\frac{3}{5} - \frac{4}{5}$$

$$52) -4\frac{\quad}{\quad} - \frac{10}{3}$$

### Solution

$$49) <$$

$$50) <$$

$$51) >$$

$$52) <$$

## Locate Decimals on the Number Line

Since decimals are forms of fractions, locating decimals on the number line is similar to locating fractions on the number line.

### Example 1.6.6

Locate  $0.4$  on the number line.

### Solution

**Step 1: A proper fraction has value less than one.**

The decimal number  $0.4$  is equivalent to  $\frac{4}{10}$ , a proper fraction, so  $0.4$  is located between  $0$  and  $1$ .

**Step 2: On a number line, divide the interval between  $0$  and  $1$  into  $10$  equal parts.****Step 3: Now label the parts  $0.1, 0.2, 0.3, 0.4, 0.5, 0.6, 0.7, 0.8, 0.9, 1.0$ .**

We write  $0$  as  $0.0$  and  $1$  as  $1.0$ , so that the numbers are consistently in tenths.

**Step 4: Finally, mark  $0.4$  on the number line.** See Figure 1.6.7.

Figure 1.6.7

**Try It**

53) Locate on the number line:  $0.6$ .

**Solution**

Figure 1.6.8

## Try It

54) Locate on the number line: **0.9**.

### Solution

Figure 1.6.9

## Example 1.6.7

Locate  **$-0.74$**  on the number line.

### Solution

**Step 1:** The decimal  $-0.74$  is equivalent to  $-\frac{74}{100}$ , so it is located between 0 and  $-1$ .

**Step 2:** On a number line, mark off and label the hundredths in the interval between 0 and  $-1$ . See Figure 1.6.10.

Figure 1.6.10

## Try It

55) Locate on the number line:  $-0.6$ .

**Solution**

Figure 1.6.11

## Try It

56) Locate on the number line:  $-0.7$ .

**Solution**

Figure 1.6.12

Which is larger,  $0.04$  or  $0.40$ ? If you think of this as money, you know that  $\$0.40$  (forty cents) is greater than  $\$0.04$  (four cents). So,  $0.40 > 0.04$ .

Again, we can use the number line to order numbers.

- $a < b$  “ $a$  is less than  $b$ ” when  $a$  is to the left of  $b$  on the number line

- $a > b$  “ $a$  is greater than  $b$ ” when  $a$  is to the right of  $b$  on the number line

Where are 0.04 and 0.40 located on the number line? See Figure 1.6.13.

Figure 1.6.13

We see that 0.40 is to the right of 0.04 on the number line. This is another way to demonstrate that  $0.40 > 0.04$ .

How does 0.31 compare to 0.308? This doesn't translate into money to make it easy to compare. But if we convert 0.31 and 0.308 into fractions, we can tell which is larger.

Steps	0.31	0.308
Convert to fractions.	$\frac{31}{100}$	$\frac{308}{1000}$
We need a common denominator to compare them.	$\frac{31 \times 10}{100 \times 10}$	$\frac{308}{1000}$
	$\frac{310}{1000}$	$\frac{308}{1000}$

Because  $310 > 308$ , we know that  $\frac{310}{1000} > \frac{308}{1000}$ . Therefore,  $0.31 > 0.308$ .

Notice what we did in converting 0.31 to a fraction—we started with the fraction  $\frac{31}{100}$  and ended with the equivalent fraction  $\frac{310}{1000}$ . Converting  $\frac{310}{1000}$  back to a decimal gives 0.310. So 0.31 is equivalent to 0.310. Writing zeros at the end of a decimal does not change its value!

$$\frac{31}{100} = \frac{310}{1000} \quad \text{and} \quad 0.31 = 0.310$$

We say 0.31 and 0.310 are **equivalent decimals**.

## Equivalent Decimals

Two decimals are equivalent if they convert to equivalent fractions.

We use equivalent decimals when we order decimals.

The steps we take to order decimals are summarized here.

## HOW TO

### Order Decimals

**Step 1:** Write the numbers one under the other, lining up the decimal points.

**Step 2:** Check to see if both numbers have the same number of digits. If not, write zeros at the end of the one with fewer digits to make them match.

**Step 3:** Compare the numbers as if they were whole numbers.

**Step 4:** Order the numbers using the appropriate inequality sign.

## Example 1.6.8

Order  $0.64$  \_\_\_  $0.6$  using  $<$  or  $>$ .

### Solution

**Step 1:** Write the numbers one under the other, lining up the decimal points.

$$0.64$$
$$0.6$$

**Step 2: Add a zero to 0.6 to make it a decimal with 2 decimal places.**

Now they are both hundredths.

$$0.64$$

$$0.60$$

**Step 3: 64 is greater than 60.**

$$64 > 60$$

**Step 4: 64 hundredths is greater than 60 hundredths.**

$$0.64 > 0.60$$

## Try It

57) Order each of the following pairs of numbers, using  $<$  or  $>$  :  $0.42$  \_\_\_  $0.4$ .

**Solution**

$>$

## Try It

58) Order each of the following pairs of numbers, using  $<$  or  $>$  :  $0.18$  \_\_\_  $0.1$ .

**Solution**

$>$

### Example 1.6.9

Order  $0.83$  \_\_\_  $0.803$  using  $<$  or  $>$ .

**Solution**

**Step 1:** Write the numbers one under the other, lining up the decimals.

**Step 2:** They do not have the same number of digits.

$$\begin{array}{r} 0.83 \\ 0.803 \end{array}$$

**Step 3:** Write one zero at the end of  $0.83$ .

$$\begin{array}{r} 0.830 \\ 0.803 \end{array}$$

**Step 4:** Since  $830 > 803$ ,  $830$  thousandths is greater than  $803$  thousandths.

$$\begin{array}{l} 0.830 > 0.803 \\ 0.83 > 0.803 \end{array}$$

### Try It

59) Order the following pair of numbers, using  $<$  or  $>$  :  $0.76$  \_\_\_  $0.706$ .

**Solution**

$>$

## Try It

60) Order the following pair of numbers, using  $<$  or  $>$  :  $0.305$  \_\_\_\_  $0.35$ .

### Solution

$<$

When we order negative decimals, it is important to remember how to order negative integers. Recall that larger numbers are to the right on the number line. For example, because  $-2$  lies to the right of  $-3$  on the number line, we know that  $-2 > -3$ . Similarly, smaller numbers lie to the left on the number line. For example, because  $-9$  lies to the left of  $-6$  on the number line, we know that  $-9 < -6$ . See Figure 1.6.14.

Figure 1.6.14

If we zoomed in on the interval between  $0$  and  $-1$ , as shown in Figure 1.6.6, we would see in the same way that  $-0.2 > -0.3$  and  $-0.9 < -0.6$ .

## Example 1.6.10

Use  $<$  or  $>$  to order  $-0.1$  \_\_\_\_  $-0.8$ .

### Solution

**Step 1:** Write the numbers one under the other, lining up the decimal points.

They have the same number of digits.

$-0.1$
$-0.8$

Since  $-1 > -8$ ,  $-1$  tenth is greater than  $-8$  tenths.  $-0.1 > -0.8$

### Try It

61) Order the following pair of numbers, using  $<$  or  $>$ :  $-0.3$  \_\_\_\_  $-0.5$ .

**Solution**

$>$

### Try It

62) Order the following pair of numbers, using  $<$  or  $>$ :  $-0.6$  \_\_\_\_  $-0.7$ .

**Solution**

$>$

## Key Concepts

**Square Root Notation**

$\sqrt{m}$  is read 'the square root of  $m$ .' If  $m = n^2$ , then  $\sqrt{m} = n$ , for  $n \geq 0$ .

### Order Decimals

1. Write the numbers one under the other, lining up the decimal points.
2. Check to see if both numbers have the same number of digits. If not, write zeros at the end of the one with fewer digits to make them match.
3. Compare the numbers as if they were whole numbers.
4. Order the numbers using the appropriate inequality sign.

### Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=344#h5p-42>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## Glossary

### equivalent decimals

Two decimals are equivalent if they convert to equivalent fractions.

### irrational number

An irrational number is a number that cannot be written as the ratio of two integers. Its decimal form does not stop and does not repeat.

**rational number** A rational number is a number of the form  $\frac{p}{q}$ , where  $p$  and  $q$  are integers and  $q \neq 0$ . A rational number can be written as the ratio of two integers. Its decimal form stops or repeats.

### radical sign

A radical sign is the symbol  $\sqrt{m}$  that denotes the positive square root.

### real number

A real number is a number that is either rational or irrational.

### square and square root

If  $n^2 = m$ , then  $m$  is the square of  $n$  and  $n$  is a square root of  $m$ .

# 1.7 PROPERTIES OF REAL NUMBERS

## Learning Objectives

By the end of this section, you will be able to:

- Use the commutative and associative properties
- Use the identity and inverse properties of addition and multiplication
- Use the properties of zero
- Simplify expressions using the distributive property

## Use the Commutative and Associative Properties

Think about adding two numbers, say 5 and 3. The order we add them doesn't affect the result, does it?

$5 + 3$	$3 + 5$
8	8
$5 + 3$	$3 + 5$

The results are the same.

As we can see, the order in which we add does not matter!

What about multiplying 5 and 3?

$5 \times 3$	$3 \times 5$
15	15

$$5 \times 3 = 3 \times 5$$

Again, the results are the same!

The order in which we multiply does not matter!

These examples illustrate the *commutative property*. When adding or multiplying, changing the *order* gives the same result.

## Commutative Property

of Addition

if  $a, b$  are real numbers, then

$$a + b = b + a$$

of  
Multiplication

if  $a, b$  are real numbers, then

$$a \times b = b \times a$$

When adding or multiplying, changing the order gives the same result.

The commutative property has to do with order. If you change the order of the numbers when adding or multiplying, the result is the same.

What about subtraction? Does order matter when we subtract numbers? Does  $7 - 3$  give the same result as  $3 - 7$ ?

$7 - 3$	$3 - 7$
$4$	$-4$

$$4 \neq -4$$

$$7 - 3 \neq 3 - 7$$

The results are not the same.

Since changing the order of the subtraction did not give the same result, we know that *subtraction is not commutative*.

Let's see what happens when we divide two numbers. Is division commutative?

$$12 \div 4$$

$$\frac{12}{4}$$

$$3$$

$$14 \div 12$$

$$\frac{4}{12}$$

$$\frac{1}{3}$$

$$3 \neq \frac{1}{3}$$

$$12 \div 4 \neq 4 \div 12$$

The results are not the same. Since changing the order of the division did not give the same result, *division is not commutative*.

The commutative properties only apply to addition and multiplication!

- Addition and Multiplication *are* commutative.
- Subtraction and Division *are not* commutative.

If you were asked to simplify this expression, how would you do it and what would your answer be?

$$7 + 8 + 2$$

Some people would think  $7 + 8$  is 15 and then  $15 + 2$  is 17. Others might start with  $8 + 2$  makes 10 and then  $7 + 10$  makes 17.

Either way gives the same result. Remember, we use parentheses as grouping symbols to indicate which operation should be done first.

Add $7 + 8$	$(7 + 8) + 2$
Add	$15 + 2$
	17
Add $8 + 2$	$7 + (8 + 2)$
Add	$7 + 10$
	17
$(7 + 8) + 2 = 7 + (8 + 2)$	

When adding three numbers, changing the grouping of the numbers gives the same result.

This is true for multiplication, too.

Multiply $5 \cdot \frac{1}{3}$	$\left(5 \times \frac{1}{3}\right) \times 3$
Multiply.	$\frac{5}{3} \times 3$
	5

$$\text{Multiply } \frac{1}{3} \cdot 3 \quad 5 \times \left( \frac{1}{3} \times 3 \right)$$

$$\text{Multiply.} \quad 5 \times 1$$

$$5$$

$$\left( 5 \times \frac{1}{3} \right) \times 3 = 5 \times \left( \frac{1}{3} \times 3 \right)$$

When multiplying three numbers, changing the grouping of the numbers gives the same result.

You probably know this, but the terminology may be new to you. These examples illustrate the associative property.

### Associative Property

<b>of Addition</b>	If $a, b, c$ are real numbers, then
	$(a + b) + c = a + (b + c)$
<b>of Multiplication</b>	If $a, b, c$ are real numbers, then
	$(a \times b) \times c = a \times (b \times c)$

When adding or multiplying, changing the *grouping* gives the same result.

Let's think again about multiplying  $5 \times \frac{1}{3} \times 3$ . We got the same result both ways, but which way was easier?

Multiplying  $\frac{1}{3}$  and 3 first, as shown above on the right side, eliminates the fraction in the first step. Using the associative property can make the math easier!

The associative property has to do with grouping. If we change how the numbers are grouped, the result will be the same. Notice it is the same three numbers in the same order—the only difference is the grouping.

We saw that subtraction and division were not commutative. They are not associative either.

When simplifying an expression, it is always a good idea to plan what the steps will be. In order to combine like terms in the next example, we will use the commutative property of addition to write the like terms together.

**Example 1.7.1**

Simplify:  $18p + 6q + 15p + 5q$

**Solution**

**Step 1:** Use the commutative property of addition to re-order so that like terms are together.

**Step 2:** Add like terms.

$$33p + 11q$$

**Try It**

1) Simplify:  $23r + 14s + 9r + 15s$

**Solution**

$$32r + 29s$$

2) Simplify:  $37m + 21n + 4m - 15n$

**Solution**

$$41m + 6n$$

When we have to simplify algebraic expressions, we can often make the work easier by applying the commutative or associative property first, instead of automatically following the order of operations. When adding or subtracting fractions, combine those with a common denominator first.

### Example 1.7.2

Simplify:  $(\frac{5}{13} + \frac{3}{4}) + \frac{1}{4}$

#### Solution

**Step 1:** Notice that the last 2 terms have a common denominator, so change the grouping.

$$\frac{5}{13} + (\frac{3}{4} + \frac{1}{4})$$

**Step 2:** Add in parentheses first.

$$\frac{5}{13} + (\frac{4}{4})$$

**Step 3:** Simplify the fraction.

$$\frac{5}{13} + (1)$$

**Step 4:** Add.

$$1\frac{5}{13}$$

**Step 5:** Convert to an improper fraction.

$$\frac{18}{13}$$

### Try It

3) Simplify:  $(\frac{7}{15} + \frac{5}{8}) + \frac{3}{8}$

**Solution**

$$1\frac{7}{15}$$

4) Simplify:  $(\frac{2}{9} + \frac{7}{12}) + \frac{5}{12}$

**Solution**

$$1\frac{2}{9}$$

### Example 1.7.3

Use the associative property to simplify  $6(3x)$ .

**Solution**

**Step 1: Change the grouping.**

$$(6 \times 3)x$$

**Step 2: Multiply in the parentheses.**

$$18x$$

Notice that we can multiply  $6 \times 3$  but we could not multiply  $3x$  without having a value for  $x$ .

### Try It

5) Use the associative property to simplify  $8(4x)$

**Solution**

$32x$

6) Use the associative property to simplify  $-9(7y)$

**Solution**

$-63y$

## Use the Identity and Inverse Properties of Addition and Multiplication

What happens when we add 0 to any number? Adding 0 doesn't change the value. For this reason, we call 0 the **additive identity**.

For example,

$13 + 0$	$-14 + 0$	$0 + (-8)$
13	-14	-8

These examples illustrate the *Identity Property of Addition* that states that for any real number,  $a$ ,  $a + 0 = a$  and  $0 + a = a$ .

What happens when we multiply any number by one? Multiplying by 1 doesn't change the value. So we call 1 the **multiplicative identity**.

For example,

$43 \times 1$	$-27 \times 1$	$1 \times \frac{3}{5}$
43	-27	$\frac{3}{5}$

These examples illustrate the *Identity Property of Multiplication* that states that for any real number,  $a$ ,  $a \cdot 1 = a$  and  $1 \cdot a = a$ .

We summarize the Identity Properties below.

## Identity Property

of addition for any real number $a$ : $0$ is the additive identity	$a + 0 = a$	$0 + a = a$
of multiplication for any real number $a$ : $1$ is the multiplicative identity	$a \times 1 = a$	$1 \times a = a$

What number added to  $5$  gives the additive identity,  $0$ ?

$$5 + \underline{\quad} = 0 \quad \text{We know that } 5 + (-5) = 0$$

What number added to  $-6$  gives the additive identity,  $0$ ?

$$-6 + \underline{\quad} = 0 \quad \text{We know } (-6) + 6 = 0$$

Notice that in each case, the missing number was the opposite of the number!

We call  $-a$  the **additive inverse** of  $a$ . *The opposite of a number is its additive inverse.* A number and its opposite add to zero, which is the additive identity. This leads to the *Inverse Property of Addition* that states for any real number,  $a$ ,  $a + (-a) = 0$ . Remember, a number and its opposite add to zero.

What number multiplied by  $\frac{2}{3}$  gives the multiplicative identity,  $1$ ? In other words,  $\frac{2}{3}$  times what results in  $1$ ?

$$\frac{2}{3} \cdot \underline{\quad} = 1 \quad \text{We know } \frac{2}{3} \cdot \frac{3}{2} = 1$$

What number multiplied by  $2$  gives the multiplicative identity,  $1$ ? In other words  $2$  times what results in  $1$ ?

$$2 \cdot \underline{\quad} = 1 \quad \text{We know } 2 \cdot \frac{1}{2} = 1$$

Notice that in each case, the missing number was the reciprocal of the number!

We call  $\frac{1}{a}$  the **multiplicative inverse** of  $a$ . *The reciprocal of a number is its multiplicative inverse.* A number and its reciprocal multiply to one, which is the multiplicative identity. This leads to the *Inverse Property of Multiplication* that states that for any real number,  $a$ ,  $a \neq 0$ ,  $a \times \frac{1}{a} = 1$ .

We'll formally state the inverse properties here:

## Inverse Property

<b>of addition</b>	For any real number $a$ , $-a$ is the additive inverse of $a$ . A number and its opposite add to zero.	$a + (-a) = 0$
<b>of multiplication</b>	For any real number $a$ , $\frac{1}{a}$ is the multiplicative inverse of $a$ . A number and its reciprocal multiply to one.	$a \times \frac{1}{a} = 1$

### Example 1.7.4

Find the additive inverse of

- a.  $\frac{5}{8}$
- b.  $0.6$
- c.  $-8$
- d.  $\frac{4}{3}$

#### Solution

To find the additive inverse, we find the opposite.

- a. The additive inverse of  $\frac{5}{8}$  is the opposite of  $\frac{5}{8}$ . The additive inverse of  $\frac{5}{8}$  is  $-\frac{5}{8}$ .
- 

- b. The additive inverse of  $0.6$  is the opposite of  $0.6$ . The additive inverse of  $0.6$  is  $-0.6$ .
-

c. The additive inverse of  $-8$  is the opposite of  $-8$ . We write the opposite of  $-8$  as  $-(-8)$ , and then simplify it to  $8$ . Therefore, the additive inverse of  $-8$  is  $8$ .

---

d. The additive inverse of  $-\frac{4}{3}$  is the opposite of  $-\frac{4}{3}$ . We write this as  $-(-\frac{4}{3})$  and then simplify to  $\frac{4}{3}$ . Thus, the additive inverse of  $-\frac{4}{3}$  is  $\frac{4}{3}$ .

## Try It

7) Find the additive inverse of:

- a.  $\frac{7}{9}$
- b.  $1.2$
- c.  $-14$
- d.  $-\frac{9}{4}$

### Solution

- a.  $-\frac{7}{9}$
- b.  $-1.2$
- c.  $14$
- d.  $\frac{9}{4}$

8) Find the additive inverse of:

- a.  $\frac{7}{13}$
- b.  $8.4$

c.  $-46$

d.  $-\frac{5}{2}$

**Solution**

a.  $-\frac{7}{13}$

b.  $-8.4$

c.  $46$

d.  $\frac{5}{2}$

**Example 1.7.5**

Find the multiplicative inverse of

a.  $9$

b.  $-\frac{1}{9}$

c.  $0.9$

**Solution**

To find the multiplicative inverse, we find the reciprocal.

a. The multiplicative inverse of  $9$  is the reciprocal of  $9$ , which is  $\frac{1}{9}$ . Therefore, the multiplicative inverse of  $9$  is  $\frac{1}{9}$ .

---

b. The multiplicative inverse of  $-\frac{1}{9}$  is the reciprocal of  $-\frac{1}{9}$  which is  $-9$ . Thus, the multiplicative inverse of  $-\frac{1}{9}$  is  $-9$ .

c.

**Step 1: To find the multiplicative inverse of 0.9, we first convert 0.9 to a fraction**

$$\frac{9}{10}$$

**Step 2: Then we find the reciprocal of the fraction.**

The reciprocal of  $\frac{9}{10}$  is  $\frac{10}{9}$ .

So the multiplicative inverse of 0.9 is  $\frac{10}{9}$ .

## Try It

9) Find the multiplicative inverse of

a. 4

b.  $-\frac{1}{7}$ 

c. 0.3

**Solution**a.  $\frac{1}{4}$ b.  $-7$ c.  $\frac{10}{3}$ 

10) Find the multiplicative inverse of

a. 18

b.  $-\frac{4}{5}$

c. 0.6

**Solution**

a.  $\frac{1}{18}$

b.  $-\frac{5}{4}$

c.  $\frac{5}{3}$

## Use the Properties of Zero

The identity property of addition says that when we add 0 to any number, the result is that same number. What happens when we multiply a number by 0? Multiplying by 0 makes the product equal zero.

### Multiplication by Zero

For any real number  $a$ ,

$$0 \times a = 0 \quad a \times 0 = 0$$

The product of any real number and 0 is 0.

What about division involving zero? What is  $0 \div 3$ ? Think about a real example: If there are no cookies in the cookie jar and 3 people are to share them, how many cookies does each person get? There are no cookies to share, so each person gets 0 cookies. So,  $0 \div 3 = 0$

We can check division with the related multiplication fact.

$$12 \div 6 = 2 \text{ because } 2 \times 6 = 12$$

So we know  $0 \div 3 = 0$  because  $0 \times 3 = 0$ .

## Division of Zero

For any real number,  $a$ , except  $0$ ,

$$\frac{0}{a} = 0 \text{ and } 0 \div a = 0.$$

Zero is divided by any real number except zero is zero.

Now think about dividing *by* zero. What is the result of dividing  $4$  by  $0$ ? Think about the related multiplication fact:  $4 \div 0 = ?$  means  $? \times 0 = 4$ . Is there a number that multiplied by  $0$  gives  $4$ ? Since any real number multiplied by  $0$  gives  $0$ , there is no real number that can be multiplied by  $0$  to obtain  $4$ .

We conclude that there is no answer to  $4 \div 0$  and so we say that division by  $0$  is undefined.

## Division by Zero

For any real number  $a$ , except  $0$ ,

$$\frac{a}{0} \text{ and } a \div 0 \text{ are undefined.}$$

Division by zero is undefined.

We summarize the properties of zero below.

## Properties of Zero

**Multiplication by Zero:** For any real number  $a$ ,

---

$$a \times 0 = 0 \quad 0 \times a = 0 \quad \text{The product of any number and } 0 \text{ is } 0.$$

---

**Division by Zero:** For any real number  $a$ , where  $a \neq 0$

---

$$\frac{0}{a} = 0 \quad \text{Zero divided by any real number except itself is zero.}$$

$$\frac{a}{0} \text{ is undefined} \quad \text{Division by zero is undefined.}$$

---

### Example 1.7.6

Simplify:

a.  $-8 \times 0$

b.  $\frac{0}{-2}$

c.  $\frac{-32}{0}$

**Solution**

a.

**Step 1:** The product of any real number and 0 is 0.

$$\begin{array}{r} -8 \times 0 \\ 0 \end{array}$$

---

b.

**Step 1:** The product of any real number and 0 is 0.

$$\frac{0}{-2}$$

---

$$0$$

c.

**Step 1: Division by 0 is undefined.**

$$\frac{-32}{0}$$

Undefined

## Try It

11) Simplify:

a.  $-14 \cdot 0$

b.  $\frac{0}{-6}$

c.  $\frac{-2}{0}$

**Solution**

a. 0

b. 0

c. undefined

12) Simplify:

a.  $0(-17)$

b.  $\frac{0}{-10}$

c.  $\frac{-5}{0}$

**Solution**

- a. 0
- b. 0
- c. undefined

We will now practice using the properties of identities, inverses, and zero to simplify expressions.

**Example 1.7.7**

Simplify:

- a.  $\frac{0}{n+5}$ , where  $n \neq -5$
- b.  $\frac{10-3p}{0}$ , where  $10-3p \neq 0$

**Solution**

a.

**Step 1:** Zero divided by any real number except itself is 0.

$$\frac{0}{n+5}$$

---

b.

**Step 1:** Division by 0 is undefined.

$$\frac{10-3p}{0}$$

Undefined

### Example 1.7.8

Simplify:  $-84n + (-73n) + 84n$

**Solution**

**Step 1:** Notice that the first and third terms are opposites; use the commutative property of addition to re-order the terms.

$$-84n + 84n + (-73n)$$

**Step 2:** Add left to right.

$$0 + (-73n)$$

**Step 3:** Add.

$$-73n$$

### Try It

13) Simplify:  $-27a + (-48) + 27a$

**Solution**

$$-48a$$

14) Simplify:  $39x + (-92x) + (-39x)$

**Solution**

$$-92x$$

Now we will see how recognizing reciprocals is helpful. Before multiplying left to right, look for reciprocals—their product is 1.

**Example 1.7.9**

Simplify:  $\frac{7}{15} \times \frac{8}{23} \times \frac{15}{7}$

**Solution**

**Step 1:** Notice that the first and third terms are reciprocals, so use the commutative property of multiplication to re-order the factors.

$$\frac{7}{15} \times \frac{15}{7} \times \frac{8}{23}$$

**Step 2:** Multiply left to right.

$$\frac{8}{23}$$

**Try It**

15) Simplify:  $\frac{9}{16} \times \frac{5}{49} \times \frac{16}{9}$

**Solution**

$$\frac{5}{49}$$

16) Simplify:  $\frac{6}{17} \times \frac{11}{25} \times \frac{17}{6}$

**Solution**

$$\frac{11}{25}$$

## Try It

17) Simplify:

a.  $\frac{0}{m+7}$ , where  $m \neq -7$

b.  $\frac{18-6c}{0}$ , where  $18-6c \neq 0$

**Solution**

a. 0

b. undefined

18) Simplify:

a.  $\frac{0}{d-4}$ , where  $d \neq 4$

b.  $\frac{15-4q}{0}$ ,  $15-4q \neq 0$

**Solution**

a. 0

b. undefined

## Example 1.7.10

Simplify:  $\frac{3}{4} \times \frac{4}{3}(6x + 12)$

**Solution**

**Step 1:** There is nothing to do in the parentheses, so multiply the two fractions first—notice, they are reciprocals.

$$1(6x + 12)$$

**Step 2:** Simplify by recognizing the multiplicative identity.

$$(6x + 12)$$

## Try It

19) Simplify:  $\frac{2}{5} \times \frac{5}{2}(20y + 50)$

**Solution**

$$20y + 50$$

20) Simplify:  $\frac{3}{8} \times \frac{8}{3}(12z + 16)$

**Solution**

$$12z + 16$$

## Simplify Expressions Using the Distributive Property

Suppose that three friends are going to the movies. They each need \$9.25—that's 9 dollars and 1 quarter—to pay for their tickets. How much money do they need all together?

You can think about the dollars separately from the quarters. They need 3 times \$9 so \$27, and 3 times 1 quarter, so 75 cents. In total, they need \$27.75. If you think about doing the math in this way, you are using the *distributive property*.

## Distributive Property

$$a(b+c)=ab+ac$$

---

If  $a, b, c$  are real numbers, then

	$(b + c)a = ba + ca$
Also,	$a(b - c) = ab - ac$
	$(b - c)a = ba - ca$

---

Back to our friends at the movies, we could find the total amount of money they need like this:

$$\begin{aligned} &3(9.25) \\ &3(9 + 0.25) \\ &3(9) + 3(0.25) \\ &27 + 0.75 \\ &27.75 \end{aligned}$$

In algebra, we use the distributive property to remove parentheses as we simplify expressions.

For example, if we are asked to simplify the expression  $3(x + 4)$  the order of operations says to work in the parentheses first. But we cannot add  $x$  and  $4$ , since they are not like terms. So we use the distributive property, as shown in Example 1.7.11.

Some students find it helpful to draw in arrows to remind them how to use the distributive property. Then the first step in Example 1.7.11 would look like this:

$$3(x + 4)$$

Figure  
1.7.1

**Example 1.7.11**

Simplify:  $3(x + 4)$

**Solution**

**Step 1: Distribute**

$$3 \times x + 3 \times 4$$

**Step 2: Multiply.**

$$3x + 12$$

**Try It**

21) Simplify:  $4(x + 2)$

**Solution**

$$4x + 8$$

22) Simplify:  $6(x + 7)$

**Solution**

$$6x + 42$$

**Example 1.7.12**

Simplify:  $8\left(\frac{3}{8}x + \frac{1}{4}\right)$

**Solution**

$$8\left(\frac{3}{8}x + \frac{1}{4}\right)$$

Figure 1.7.2

**Step 1: Distribute.**

$$8 \cdot \frac{3}{8}x + 8 \cdot \frac{1}{4}$$

**Step 2: Multiply.**

$$3x + 2$$

**Try It**

23) Simplify:  $6\left(\frac{5}{6}y + \frac{1}{2}\right)$

**Solution**

$$5y + 3$$

24) Simplify:  $12\left(\frac{1}{3}n + \frac{3}{4}\right)$

**Solution**

$$4n + 9$$

Using the distributive property as shown in Example 1.7.13 will be very useful when we solve money applications in later chapters.

### Example 1.7.13

Simplify:  $100(0.3 + 0.25q)$

**Solution**

$$100(0.3 + 0.25q)$$

Figure 1.7.3

**Step 1: Distribute.**

$$100(0.3) + 100(0.25q)$$

**Step 2: Multiply.**

$$30 + 25q$$

### Try It

25) Simplify:  $100(0.7 + 0.15p)$

**Solution**

$$70 + 15p$$

26) Simplify:  $100(0.04 + 0.35d)$

**Solution**

$$4 + 35d$$

When we distribute a negative number, we need to be extra careful to get the signs correct!

### Example 1.7.14

Simplify:  $-2(4y + 1)$

**Solution**

$$-2(4y + 1)$$

Figure 1.7.4

**Step 1: Distribute.**

$$-2 \cdot 4y + (-2) \cdot 1$$

**Step 2: Multiply.**

$$-8y - 2$$

## Try It

27) Simplify:  $-3(6m + 5)$

**Solution**

$$-18m - 15$$

28) Simplify:  $-6(8n + 11)$

**Solution**

$$-48n - 66$$

## Example 1.7.15

Simplify:  $-11(4 - 3a)$

**Solution**

**Step 1: Distribute.**

$$-11(4 - 3a)$$

Figure 1.7.5

**Step 2: Multiply.**

$$\begin{aligned} & -11 \cdot 4 - (-11) \cdot 13a \\ & -44 - (-33a) \end{aligned}$$

**Step 3: Simplify.**

$$-44 + 33a$$

Notice that you could also write the result as  $33a - 44$ . Do you know why?

## Try It

29) Simplify:  $-5(2 - 3a)$

**Solution**

$$-10 + 15a$$

30) Simplify:  $-7(8 - 15y)$

**Solution**

$$-56 + 105y$$

Example 1.7.16 will show how to use the distributive property to find the opposite of an expression.

## Example 1.7.16

Simplify:  $-(y + 5)$

**Solution**

**Step 1:** Multiplying by  $-1$  results in the opposite.

$$-1(y + 5)$$

**Step 2:** Distribute.

$$-1 \times y + -1 \times 5$$

**Step 3: Simplify.**

$$\begin{aligned} & -y + (-5) \\ & -y - 5 \end{aligned}$$

## Try It

31) Simplify:  $-(z - 11)$

**Solution**

$$-z + 11$$

32) Simplify:  $-(x - 4)$

**Solution**

$$-x + 4$$

There will be times when we'll need to use the distributive property as part of the order of operations. Start by looking at the parentheses. If the expression inside the parentheses cannot be simplified, the next step would be multiply using the distributive property, which removes the parentheses. The next two examples will illustrate this.

## Example 1.7.17

Simplify:  $8 - 2(x + 3)$

Be sure to follow the order of operations. Multiplication comes before subtraction, so we will distribute the **2** first and then subtract.

**Solution**

**Step 1: Distribute.**

$$8 - 2 \times x - 2 \times 3$$

**Step 2: Multiply.**

$$8 - 2x - 6$$

**Step 3: Combine like terms.**

$$-2x + 2$$

## Try It

33) Simplify:  $9 - 3(x + 2)$

**Solution**

$$3 - 3x$$

34) Simplify:  $7x - 5(x + 4)$

**Solution**

$$2x - 20$$

**Example 1.7.18**

Simplify:  $4(x - 8) - (x + 3)$

**Solution**

**Step 1: Distribute.**

$$4x - 32 - x - 3$$

**Step 2: Combine like terms.**

$$3x - 35$$

**Try It**

35) Simplify:  $6(x - 9) - (x + 12)$

**Solution**

$$5x - 66$$

36) Simplify:  $8(x - 1) - (x + 5)$

**Solution**

$$7x - 13$$

All the properties of real numbers we have used in this chapter are summarized in the table below.

---

**Commutative Property**

of addition:

If  $a, b$  are real numbers, then

$$a + b = b + a$$

of multiplication:

If  $a, b$  are real numbers, then

$$a \times b = b \times a$$

---

**Associative Property**

of addition

If  $a, b, c$  are real numbers, then

$$(a + b) + c = a + (b + c)$$

of multiplication

If  $a, b, c$  are real numbers, then

$$(a \times b) \times c = a \times (b \times c)$$

---

**Distributive Property**If  $a, b, c$  are real numbers, then

$$a(b + c) = ab + ac$$

---

**Identity Property**

of addition

For any real number  $a$ : 0 is the additive identity

$$a + 0 = a$$

$$0 + a = a$$

of multiplication

For any real number  $a$ : 1 is the multiplicative identity

$$1 \times a = a$$

$$a \times 1 = a$$

---

**Inverse Property**

of addition

For any real number  $a$ ,  $-a$  is the additive inverse of  $a$ 

$$a + (-a) = 0$$

of multiplication

For any real number  $a$ ,  $a \neq 0$

$\frac{1}{a}$  is the multiplicative inverse of  $a$

$$a \times \frac{1}{a} = 1$$

### Properties of Zero

For any real number  $a$ ,  $a \times 0 = 0$

$$a \times 0 = 0$$

$$\frac{0}{a} = 0$$

For any real number  $a$ ,  $a \neq 0$

$$\frac{a}{0} \text{ is undefined}$$

## Key Concepts

### • Commutative Property of

- *Addition:* If  $a, b$ , are real numbers, then  $a + b = b + a$ .
- *Multiplication:* If  $a, b$ , are real numbers, then  $a \cdot b = b \cdot a$ . When adding or multiplying, changing the *order* gives the same result.

### • Associative Property of

- *Addition:* If  $a, b, c$  are real numbers, then  $(a + b) + c = a + (b + c)$
- *Multiplication:* If  $a, b, c$  are real numbers, then  $(a \cdot b) \cdot c = a \cdot (b \cdot c)$   
When adding or multiplying, changing the *grouping* gives the same result.

### • Distributive Property: If $a, b, c$ are real numbers, then

- $a(b + c) = ab + ac$
- $(b + c)a = ba + ca$
- $a(b - c) = ab - ac$

- $(b - c)a = ba - ca$

- **Identity Property**

- *of Addition:* For any real number  $a$ ,  $a + 0 = a$ ,  $0 + a = a$   
0 is the *additive identity*
- *of Multiplication:* For any real number  $a$ ,  $a \cdot 1 = a$ ,  $1 \cdot a = a$   
1 is the *multiplicative identity*

- **Inverse Property**

- *of Addition:* For any real number  $a$ ,  $a + (-a) = 0$ . A number and its *opposite* add to zero.  $-a$  is the *additive inverse* of  $a$ .
- *of Multiplication:* For any real number  $a$ ,  $a \neq 0$ ,  $\frac{1}{a} = \frac{1}{a}$ . A number and its *reciprocal* multiply to one.  $\frac{1}{a}$  is the *multiplicative inverse* of  $a$ .

- **Properties of Zero**

- For any real number  $a$ ,  
 $a \cdot 0 = 0$ ,  $0 \cdot a = 0$  – The product of any real number and 0 is 0.
- $\frac{0}{a} = 0$  for  $a \neq 0$  – Zero divided by any real number except zero is zero.
- $\frac{a}{0}$  is undefined – Division by zero is undefined.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=363#h5p-7>

After reviewing this checklist, what will you do to become confident for all objectives?

## Glossary

### **additive identity**

The additive identity is the number **0**; adding **0** to any number does not change its value.

### **additive inverse**

The opposite of a number is its additive inverse. A number and its additive inverse add to **0**.

### **multiplicative identity**

The multiplicative identity is the number **1**; multiplying 1 by any number does not change the value of the number.

### **multiplicative inverse**

The reciprocal of a number is its multiplicative inverse. A number and its multiplicative inverse multiply to one.

# UNIT 2: MEASUREMENT

## Chapter Outline

[2.0 Introduction](#)

[2.1 Systems of Measurement](#)

[2.2 Accuracy, Precision, and Rounding Rules](#)

[2.3 Scientific Notation](#)

[2.4 More Unit Conversions and Rounding Rules](#)

[2.5 Unit Sources](#)

## 2.0 INTRODUCTION

---

Figure 2.0.1. The distance from Earth to the Moon may seem immense, but it is just a tiny fraction of the distance from Earth to other celestial bodies. “[Crescent Moon, Earth's Atmosphere \(NASA, International Space Station Science, 09/04/10\)](#)” by [NASA's Marshall Space Flight Center](#) is licensed under [CC BY-NC 2.0](#).

The range of objects and phenomena studied in physics is immense. From the incredibly short lifetime of a nucleus to the age of the Earth, from the tiny sizes of sub-nuclear particles to the vast distance to the edges of the known universe, from the force exerted by a jumping flea to the force between Earth and the Sun, there are enough factors of 10 to challenge the imagination of even the most experienced scientist. Giving numerical values for physical quantities and equations for physical principles allows us to understand nature much more deeply than does qualitative description alone. To comprehend these vast ranges, we must also have accepted units in which to express them. And we shall find that (even in the potentially mundane discussion of meters,

kilograms, and seconds) a profound simplicity of nature appears—all physical quantities can be expressed as combinations of only four fundamental physical quantities: length, mass, time, and electric current.

## 2.1 SYSTEMS OF MEASUREMENT

---

### Learning Objectives

By the end of this section, you will be able to:

- Name the units in the Metric system (SI) and recognize their prefixes and their values.
- Perform metric-to-metric unit conversions using the decimal point method.
- Perform metric-to-metric unit conversions using dimensional analysis.
- Add and subtract SI units.
- Know and use the relationship between mL, g, and,  $\text{cm}^3$ .
- Recognize the U.S. system of units.
- Perform U.S. system-to-U.S. system conversions using dimensional analysis.
- Perform unit conversions (from any system) using dimensional analysis.
- Convert between Fahrenheit and Celsius temperatures.

## Measurement Systems

### The Metric System

**Metric system (SI – international system of units):** the most widely used system of measurement in the world. It is based on the basic units of meter, kilogram, second, etc.

In the metric system, units are related by powers of 10. The roots words of their names reflect this relation. For

example, the basic unit for measuring length is a meter. One kilometer is 1,000 meters; the prefix *kilo* means *thousand*. One centimeter is  $\frac{1}{100}$  of a meter, just like one cent is  $\frac{1}{100}$  of one dollar.

## SI common units:

Table 2.1.1

Quantity	Unit	Unit Symbol
Length	meter	m
Mass (or weight)	gram	kg
Volume	litre	L
Time	second	s
Temperature	degree (Celsius)	°C

**Metric prefixes (SI prefixes):** large and small numbers are made by adding SI prefixes, which is based on multiples of 10.

## Metric conversion table:

Table 2.1.2

Prefix	Symbol (abbreviation)	Power of 10	Multiple value	Example
giga	G	$10^9$	1,000,000,000	1 Gm = 1,000,000,000 m
mega	M	$10^6$	1,000,000	1 Mm = 1,000,000 m
kilo-	k	$10^3$	1,000	1 km = 1,000 m
hecto-	h	$10^2$	100	1 hm = 100 m
deka-	da	$10^1$	10	1 dam = 10 m
<b>meter/gram/ litre</b>		1 (100)		
deci-	d	$10^{-1}$	0.1	1 m = 10 dm
centi-	c	$10^{-2}$	0.01	1 m = 100 cm
milli-	m	$10^{-3}$	0.001	1 m = 1,000 mm
micro	$\mu$ or mc	$10^{-6}$	0.000 001	1 m = 1,000,000 $\mu$ m
nano	n	$10^{-9}$	0.000 000 001	1 m = 1,000,000,000 nm
pico	p	$10^{-12}$	0.000 000 000 001	1 m = 1,000,000,000,000 pm

A good way to remember the order of the metric prefixes is by using a mnemonic device such as “Great Mighty King Henry died by drinking chocolate malted milk not poison”. Notice that the first letter of each word reminds you of the metric prefix, and the word “by” represents the base units. Feel free to use this particular mnemonic device, or come up with your own!

## Metric prefix for length, weight and volume:

Table 2.1.3

Prefix	Length (m – meter)	Weight (g – gram)	Liquid volume (L – litre)
giga (G)	Gm (Gigameter)	Gg (Gigagram)	GL (Gigalitre)
mega (M)	Mm (Megameter)	Mg (Megagram)	ML (Megalitre)
kilo (k)	km (Kilometer)	kg (Kilogram)	kL (Kilolitre)
hecto (h)	hm (hectometer)	hg (hectogram)	hL (hectolitre)
deka (da)	dam (dekameter)	dag (dekagram)	daL (dekalitre)
<b>meter/gram/litre</b>	m (meter)	g (gram)	L (litre)
deci (d)	dm (decimeter)	dg (decigram)	dL (decilitre)
centi (c)	cm (centimeter)	cg (centigram)	cL (centilitre)
milli (m)	mm (millimeter)	mg (milligram)	mL (millilitre)
micro ( $\mu$ or mc)	$\mu$ m or mcm (micrometer)	$\mu$ g or mcg (microgram)	$\mu$ L or mL (microlitre)
nano (n)	nm (nanometer)	ng (nanogram)	nL (nanolitre)
pico (p)	pm (picometer)	pg (picogram)	pL (picolitre)

The more commonly used equivalencies of measurements in the metric system are shown in Table 2.1.4. The common abbreviations for each measurement are given in parentheses. Please note, that you will need to be able to convert the units outside of this table as well.

## Metric System of Measurement

Table 2.1.4

Length	Mass	Capacity
1 kilometer (km) = 1,000 m	1 kilogram (kg) = 1,000 g	1 kiloliter (kL) = 1,000 L
1 hectometer (hm) = 100 m	1 hectogram (hg) = 100 g	1 hectoliter (hL) = 100 L
1 dekameter (dam) = 10 m	1 dekagram (dag) = 10 g	1 dekaliter (daL) = 10 L
1 meter (m) = 1 m	1 gram (g) = 1 g	1 liter (L) = 1 L
1 decimeter (dm) = 0.1 m	1 decigram (dg) = 0.1 g	1 deciliter (dL) = 0.1 L
1 centimeter (cm) = 0.01 m	1 centigram (cg) = 0.01 g	1 centiliter (cL) = 0.01 L
1 millimeter (mm) = 0.001 m	1 milligram (mg) = 0.001 g	1 milliliter (mL) = 0.001 L
1 meter = 100 centimeters	1 gram = 100 centigrams	1 liter = 100 centiliters
1 meter = 1,000 millimeters	1 gram = 1,000 milligrams	1 liter = 1,000 milliliters

### Performing Metric to Metric Conversions

One of the most convenient things about the metric system is that we can use its decimal nature to convert from one unit to the other simply by moving the decimal point to the left or to the right.

#### Steps for metric conversion:

- Identify the number of places to move the decimal point.
  - Convert a **smaller** unit **to** a **larger** unit: move the decimal point to the **left**.
  - Convert a **larger** unit **to** a **smaller** unit: move the decimal point to the **right**.

### Example 2.1.1

$$326 \text{ mm} = (?) \text{ m}$$

#### Solution

**Step 1:** Identify mm (millimeters) and m (meters) on the conversion table.

**Step 2:** Count places from mm to m:

3 places left

Figure 2.1.1

**Step 3:** Move 3 decimal places.

Convert a smaller unit (mm) to a larger (m) unit: move the decimal point to the left.

$$(1m = 1000mm)$$

**Step 4:** Move the decimal point three places to the left.

$$326.mm = 0.326m$$

### Example 2.1.2

$$4.675 \text{ hg} = (?) \text{ g}$$

#### Solution

**Step 1: Identify hg (hectograms) and g (grams) on the conversion table.**

**Step 2: Count places from hg to g:**

2 places right

Figure 2.1.2

**Step 3: Move 2 decimal places.**

$$(1hg = 100g)$$

**Step 4: Convert a larger unit (hg) to a smaller (g) unit.**

Move the decimal point to the right.

**Step 5: Move the decimal point two places to the right.**

$$4.765hg = 476.5g$$

## Try It

1) Convert 0.2744kg to micrograms.

**Solution**

274,400,000 mcg (or 274,400,00  $\mu$ g)

2) Convert 12,940,000 nL to decilitres.

**Solution**

0.1294 dL

Being able to convert units by shifting the decimal point left or right is convenient and does work for a lot of our metric to metric conversions. However, as we will see later in the section, converting more complex units

may be confusing if we are using the decimal point method. Thus, it is important to have an understanding of the technique of Dimensional Analysis (or the Unit Factor Method).

## Dimensional Analysis (or the Unit Factor Method)

### Convert units using the dimensional analysis or (the Unit Factor Method)

**Step 1: Write the original term as a fraction (over 1).**

Example: 10g can be written as  $\frac{10g}{1}$

**Step 2: Write the conversion formula as a fraction,  $\frac{1}{( )}$  or  $\frac{( )}{1}$**

Example: 1m = 100 cm can be written as  $\frac{1m}{(100cm)}$  or  $\frac{(100cm)}{1m}$

**Step 3: Put the desired or unknown unit on the top.**

**Step 4: Multiply the original term by  $\frac{1}{( )}$  or  $\frac{( )}{1}$  (Cancel out the same units)**

### Example 2.1.3

1200 g = (?) kg

**Solution**

**Step 1: Write the original term (the left side) as a fraction.**

$$1200g = \frac{1200g}{1}$$

**Step 2: Write the conversion formula as a fraction.**

“kg” is the desired unit.

$$1kg = 1000g : \frac{1kg}{(1000g)}$$

**Step 3: Multiply.**

The units “g” cancel out.

$$\begin{aligned} 1200g &= \frac{1200\cancel{g}}{1} \times \frac{1kg}{(1000\cancel{g})} \\ &= \frac{1200kg}{1000} \\ &= 1.2kg \end{aligned}$$

**Example 2.1.4**

30 cm = (?) mm

**Solution****Step 1: Write the original term (the left side) as a fraction.**

$$30cm = \frac{30cm}{1}$$

**Step 2: Write the conversion formula as a fraction.**

“mm” is the desired unit.

$$1cm = 10mm : \frac{(10mm)}{1cm}$$

**Step 3: Multiply.**

The units “cm” cancel out.

$$\begin{aligned}
 30\text{cm} &= \frac{30\cancel{\text{cm}}}{(1\text{mm})} \times \frac{(10\text{mm})}{1\cancel{\text{cm}}} \\
 &= \frac{(30)(10)\text{mm}}{1} \\
 &= 300\text{mm}
 \end{aligned}$$

## Try It

Use dimensional analysis to convert the following units:

3) Convert 28.4 dag to g.

**Solution**

284 g

4) Convert 0.00485kL to dL.

**Solution**

48.5 dL

## Example 2.1.5

Have you ever run a 5K or 10K race? The length of those races are measured in kilometers. The metric system is commonly used in the United States when talking about the length of a race.

Nick ran a 10K race. How many meters did he run?

**Solution**

We will convert kilometers to meters using the identity property of multiplication.

**Step 1: Multiply the measurement to be converted by 1.**

$$10 \text{ kilometers} \times 1$$

**Step 2: Write 1 as a fraction relating kilometers and meters.**

$$10 \text{ kilometers} \cdot \frac{1,000 \text{ meters}}{1 \text{ kilometers}}$$

**Step 3: Simplify.**

$$\frac{10 \cancel{\text{ kilometers}} \cdot 1,000 \text{ m}}{1 \cancel{\text{ kilometer}}}$$

**Step 4: Multiply.**

10,000 meters. Nick ran 10,000 meters.

## Try It

5) Sandy completed her first 5K race! How many meters did she run?

**Solution**

5,000 meters

6) Herman bought a rug 2.5 meters in length. How many centimeters is the length?

**Solution**

250 centimeters

### Example 2.1.6

Eleanor's newborn baby weighed 3,200 grams. How many kilograms did the baby weigh?

**Solution**

We will convert grams into kilograms.

**Step 1: Multiply the measurement to be converted by 1.**

$$3,200 \text{ grams} \times 1$$

**Step 2: Write 1 as a function relating kilograms and grams.**

$$3,200 \text{ grams} \cdot \frac{1 \text{ kg}}{1,000 \text{ grams}}$$

**Step 3: Simplify.**

$$3,200 \cancel{\text{ grams}} \cdot \frac{1 \text{ kg}}{1,000 \cancel{\text{ grams}}}$$

**Step 4: Multiply.**

$$\frac{3,200 \text{ kilograms}}{1,000}$$

**Step 5: Divide.**

**3.2** kilograms. The baby weighed **3.2** kilograms.

### Try It

7) Kari's newborn baby weighed 2,800 grams. How many kilograms did the baby weigh?

**Solution**

2.8 kilograms

8) Anderson received a package that was marked 4,500 grams. How many kilograms did this package weigh?

**Solution**

4.5 kilograms

### Example 2.1.7

Samadia took 800mg of Ibuprofen for her inflammation. How many grams of Ibuprofen did she take?

**Solution**

We will convert milligrams to grams using the identity property of multiplication.

**Step 1: Multiply the measurement to be converted by 1.**

$$800 \text{ milligrams} \times 1$$

**Step 2: Write 1 as a fraction relating kilometres and metres.**

$$800 \text{ milligrams} \times \frac{1 \text{ gram}}{1000 \text{ milligrams}}$$

**Step 3: Simplify.**

$$800 \text{ milligrams} \times \frac{1 \text{ gram}}{1000 \text{ milligrams}}$$

**Step 4: Multiply.**

$$0.8 \text{ grams}$$

Samadia took 0.8 grams of Ibuprofen.

### Example 2.1.8

Dena's recipe for lentil soup calls for 150 milliliters of olive oil. Dena wants to triple the recipe. How many liters of olive oil will she need?

**Solution**

We will find the amount of olive oil in milliliters then convert to liters.

**Step 1: Translate to algebra.**

$$3 \times 150$$

**Step 2: Multiply.**

$$450mL$$

**Step 3: Convert to liters.**

$$450mL \times \frac{0.001L}{1mL}$$

**Step 4: Simplify.**

$$0.45L$$

Dena needs 0.45 liters of olive oil.

### Try It

9) Klaudia took 0.125 grams of Ibuprofen for his headache. How many milligrams of the medication did she take?

**Solution**

125 milligrams

10) A recipe for Alfredo sauce calls for 250 milliliters of milk. Renata is making pasta with Alfredo sauce for a big party and needs to multiply the recipe amounts by 8. How many liters of milk will she need?

**Solution**

2 liters

11) To make one pan of baklava, Dorothea needs 400 grams of filo pastry. If Dorothea plans to make 6 pans of baklava, how many kilograms of filo pastry will she need?

**Solution**

2.4 kilograms

### Example 2.1.9

The volume of blood coursing throughout an adult human body is about 5 litres. Convert it to millilitres.

**Solution**

We will convert litres to millilitres. In the Metric System of Measurement table, we see that 1 litre = 1,000 millilitres.

**Step 1: Multiply by 1, writing 1 as a fraction relating litres to millilitres.**

$$5L \times \frac{1000mL}{1L}$$

**Step 2: Simplify.**

$$5\cancel{L} \times \frac{1000mL}{1\cancel{L}} = 5 \times 1000mL$$

**Step 3: Multiply.**

$$5000mL$$

As we saw before, when we are converting metric to metric units, you may see a pattern. Since the system is

based on multiples of ten, the calculations involve multiplying by multiples of ten. We have learned how to simplify these calculations by just moving the decimal.

Remember that to multiply by 10, 100, or 1,000, we move the decimal to the right one, two, or three places, respectively. To multiply by 0.1, 0.01, or 0.001, we move the decimal to the left one, two, or three places, respectively.

We can apply this pattern when we make measurement conversions in the metric system. In Figure 2.1.1, we changed 3,200 grams to kilograms by multiplying by  $\frac{1}{1000}$  (or 0.001). This is the same as moving the decimal three places to the left.

$$\begin{array}{ccc} 3,200 \cdot \frac{1}{1,000} & & 3,200. \\ & & \text{~~~~~} \\ & & 3.2 \end{array}$$

Figure 2.1.3

### Example 2.1.10

Convert:

- a. 350 L to kiloliters
- b. 4.1 L to milliliters.

**Solution**

a. We will convert liters to kiloliters. In Table 2.1.4, we see that 1 kiloliter = 1,000 liters.

**Step 1: Multiply by 1, writing 1 as a fraction relating liters to kiloliters.**

$$350L \cdot \frac{1kL}{1,000L}$$

**Step 2: Simplify.**

$$350 \cancel{L} \cdot \frac{1kL}{1,000 \cancel{L}}$$

**Step 3: Move the decimal 3 units to the left.**

$$0.35kL$$

b. We will convert liters to milliliters. From Table 2.1.4 we see that 1 liter=1,000 milliliters.

**Step 1: Multiply by 1, writing 1 as a fraction relating liters to milliliters.**

$$4.1L \cdot \frac{1,000mL}{1L}$$

**Step 2: Simplify.**

$$4.1 \cancel{L} \cdot \frac{1,000mL}{1,000 \cancel{L}}$$

**Step 3: Move the decimal 3 units to the right.**

$$4 \overset{\text{---}\rightarrow}{.} 1 \textcolor{red}{1} 0 \textcolor{red}{2} 0 \textcolor{red}{3} = 4,100. mL$$

## Try It

12) Convert:

- a. 725 L to kiloliters
- b. 6.3 L to milliliters

### Solution

- a 7,250 kiloliters
- b 6,300 milliliters

13) Convert:

- a. 350 hL to liters
- b. 4.1 L to centiliters

### Solution

- a 35,000 liters
- b 410 centiliters

As we see, even when doing dimensional analysis, we can use the pattern of multiplying by powers of ten and

shift our decimal point to the left or right accordingly to find our answers and make our calculations more simple. However, what might we do if we needed to convert from milligrams per decilitre to grams per litre. When we use these types of units, it can make it more difficult to simply move the decimal point to the left and right. In the following example, we see how dimensional analysis can help us stay organized and convert these types of units.

### Example 2.1.11

$$100 \text{ m/s} = (?) \text{ km/h}$$

#### Solution

**Step 1: Write the original term (the left side) as a fraction.**

$$100 \text{ m/s} = \frac{100 \text{ m}}{1 \text{ s}}$$

**Step 2: Write the conversion formulas required as fractions.**

“km/h” is the desired unit

$$1000 \text{ m} = 1 \text{ km} \text{ and } 1 \text{ h} = 3600 \text{ s}$$

$$\frac{1 \text{ km}}{1000 \text{ m}} \text{ and } \frac{3600 \text{ s}}{1 \text{ h}}$$

**Step 3: Multiply.**

The units “m” and “s” cancel out.

$$\begin{aligned} 100 \text{ m/s} &= \frac{100 \cancel{\text{m}}}{1 \cancel{\text{s}}} \times \frac{1 \text{ km}}{1000 \cancel{\text{m}}} \times \frac{3600 \cancel{\text{s}}}{1 \text{ h}} \\ &= \frac{100 \times 3600 \text{ km}}{1 \times 1000 \text{ h}} \\ &= 360 \text{ km/h} \end{aligned}$$

## Try It

14) Convert 0.000005kg/L to micrograms per decilitre.

### Solution

500 mcg/dL or 500  $\mu$ g/dL.

## Adding and subtracting SI measurements:

### Example 2.1.12

Combine after converting to the same unit.

$$\begin{array}{r} 3m \\ \text{a. } -2000mm \\ \hline \end{array}$$

$$\begin{array}{r} 25kg \\ \text{b. } +4g \\ \hline \end{array}$$

### Solution

a.

**Step 1: Convert to the same unit.**

$$1m = 1,000mm$$

**Step 2: Subtract.**

$$\begin{array}{r} 3000mm \\ -2000mm \\ \hline 1000mm \end{array}$$

---

b.

**Step 1: Convert to the same unit.**

$$1kg = 1000g$$

**Step 2: Add.**

$$\begin{array}{r} 25000g \\ +4g \\ \hline 25004g \end{array}$$

## The Relationship between mL, g, and $\text{cm}^3$

How are mL, g, and  $\text{cm}^3$  related?

Figure 2.1.4

- A cube takes up  $1\text{ cm}^3$  of space ( $1\text{ cm} \times 1\text{ cm} \times 1\text{ cm} = 1\text{ cm}^3$ ).
- A cube holds 1 mL of water and has a mass of 1 gram at  $4^\circ\text{C}$ .
- $1\text{ cm}^3 = 1\text{ mL} = 1\text{ g}$

### Example 2.1.13

Convert.

a.  $16\text{cm}^3 = (?)\text{g}$

b.  $9\text{ L} = (?)\text{cm}^3$

c.  $35\text{ cm}^3 = (?)\text{cL}$

d.  $450\text{ kg} = (?)\text{L}$

#### Solution

a.  $16\text{cm}^3 = (?)\text{g}$

**Step 1: Covert  $\text{cm}^3$  to g.**

$$\begin{aligned} 1\text{ cm}^3 &= 1\text{g} \\ 16\text{ cm}^3 &= 16\text{g} \end{aligned}$$

---

b.  $9\text{ L} = (?)\text{cm}^3$

**Step 1: Convert L to mL.**

$$\begin{aligned} 1\text{ L} &= 1,000\text{ mL} \\ 9\text{ L} &= 9,000\text{ mL} \end{aligned}$$

**Step 2: Convert mL to  $\text{cm}^3$**

$$\begin{aligned} 1\text{ mL} &= 1\text{ cm}^3 \\ &= 9000\text{ cm}^3 \end{aligned}$$

---

c.  $35\text{ cm}^3 = (?)\text{cL}$

**Step 1: Convert  $\text{cm}^3$  to mL.**

$$\begin{aligned} 1\text{ cm}^3 &= 1\text{ mL} \\ 35\text{ cm}^3 &= 35\text{ mL} \end{aligned}$$

**Step 2: Move 1 decimal place left.**

$$= 3.5cL$$

---

d.  $450 \text{ kg} = (?) \text{ L}$

**Step 1: Convert kg to g.**

$$\begin{aligned} 1 \text{ kg} &= 1,000 \text{ g} \\ 450 \text{ kg} &= 450,000 \text{ g} \end{aligned}$$

**Step 2: Convert g to mL.**

$$\begin{aligned} 1 \text{ g} &= 1 \text{ mL} \\ &= 450,000 \text{ mL} \end{aligned}$$

**Step 3: Covert mL to L.**

$$\begin{aligned} 1 \text{ L} &= 1,000 \text{ mL} \\ &= 450 \text{ L} \end{aligned}$$

### Example 2.1.14

A swimming pool measures 10 m by 8 m by 2 m. How many kilolitres of water will it hold?

**Solution**

**Step 1: Find the volume in  $m^3$ .**

$$\begin{aligned} 160 \text{ m}^3 &= (?) \text{ kL} \\ V &= w \times l \times h = (8m)(10m)(2m) = 160 \text{ m}^3 \end{aligned}$$

**Step 2: Convert to  $cm^3$**

$1m = 100cm$ ,  $3 \times 2 = 6$ , move 6 places right for volume.

$$160m^3 = 160,000,000 \text{ cm}^3$$

**Step 3: Convert to mL**

$$1 \text{ mL} = 1 \text{ cm}^3$$

$$160,000,000 \text{ cm}^3 = 160,000,000 \text{ mL}$$

**Step 4: Convert to kL.**

$$160,000,000 \text{ mL} = 160 \text{ kL}$$

$$1 \text{ kL} = 1,000,000 \text{ mL}$$

$$160 \text{ m}^3 = 160 \text{ kL}$$

The swimming pool will hold 160 kL of water.

## Use Mixed Units of Measurement in the Metric System

Performing arithmetic operations on measurements with mixed units of measures in the metric system requires care. Make sure to add or subtract like units.

### Example 2.1.15

Ryland is 1.6 meters tall. His younger brother is 85 centimeters tall. How much taller is Ryland than his younger brother?

**Solution**

We can convert both measurements to either centimeters or meters. Since meters is the larger unit, we will subtract the lengths in meters. We convert 85 centimeters to meters by moving the decimal 2 places to the left.

**Step 1: Write the 85 centimeters as meters.**

85cm is 0.85m.

**Step 2: Subtract.**

$$\begin{array}{r} 1.6m \\ -0.85m \\ \hline 0.75m \end{array}$$

Ryland is 0.75 m taller than his brother.

## Try It

15) Mariella is 1.58 meters tall. Her daughter is 75 centimeters tall. How much taller is Mariella than her daughter? Write the answer in centimeters.

### **Solution**

83 centimeters

16) The fence around Hank's yard is 2 meters high. Hank is 96 centimeters tall. How much shorter than the fence is Hank? Write the answer in meters.

### **Solution**

1.04 meters

## Make Unit Conversions in the U.S. System

There are two systems of measurement commonly used around the world. Most countries use the metric system. The U.S. uses a different system of measurement, usually called the U.S. system. We will look at the U.S. system now.

The U.S. system of measurement uses units of inch, foot, yard, and mile to measure length and pound and ton to measure weight. For capacity, the units used are cup, pint, quart, and gallons. Both the U.S. system and the metric system measure time in seconds, minutes, and hours.

The equivalencies of measurements are following, also shows, in parentheses, the common abbreviations for each measurement.

**Table 2.1.5**

Length	1 foot (ft.) = 12 inches (in.)	Volume	3 teaspoons (t) = 1 tablespoon (T)	
	1 yard (yd.) = 3 feet (ft.)		16 tablespoons(T) = 1 cup (C)	
	1 mile (mi.) = 5,280 feet (ft.)		1 cup (C) = 8 fluid ounces (fl. oz.)	
Weight	1 pound (lb.) = 16 ounces (oz.) 1 ton = 2205 pounds (lb.)		1 pint (pt.) = 2 cups (C)	
			1 quart (qt) = 2 pints (pt.)	
			1 gallon (gal) = 4 quarts (qt.)	
	Time	1 minute = 60 seconds (sec)		
		1 hour (hr) = 60 minutes (min)		
		1 day = 24 hours (hr)		
		1 week (wk) = 7 days		
		1 year (yr) = 365 days		

In many real-life applications, we need to convert between units of measurement, such as feet and yards, minutes and seconds, quarts and gallons, etc. We will use the identity property of multiplication to do these conversions. We'll restate the identity property of multiplication here for easy reference.

### Identity Property of Multiplication

For any real number  $a$ :  $a \cdot 1 = a$        $1 \cdot a = a$

1 is the multiplicative identity

As we saw earlier in the section, dimensional analysis can be used to convert units. In the U.S System, since it is not a decimal system, it is best that we always use dimensional analysis to convert our units. Here, we elaborate on that concept.

To use the identity property of multiplication, we write 1 in a form that will help us convert the units. For example, suppose we want to change inches to feet. We know that 1 foot is equal to 12 inches, so we will write 1 as the fraction  $\frac{1 \text{ foot}}{12 \text{ inch}}$ . When we multiply by this fraction we do not change the value, but just change the units.

But  $\frac{1 \text{ foot}}{12 \text{ inch}}$  also equals 1. How do we decide whether to multiply by  $\frac{1 \text{ foot}}{12 \text{ inch}}$  or  $\frac{1 \text{ foot}}{12 \text{ inch}}$ ? We choose

the fraction that will make the units we want to convert *from* divide out. Treat the unit words like factors and “divide out” common units like we do common factors. If we want to convert 66 inches to feet, which multiplication will eliminate the inches?

$$66 \text{ inches} \cdot \frac{1 \text{ foot}}{12 \text{ inches}} \quad \text{or} \quad \cancel{66 \text{ inches}} \cdot \frac{\cancel{12 \text{ inches}}}{1 \text{ foot}}$$

The first form works since  $\cancel{66 \text{ inches}} \cdot \frac{1 \text{ foot}}{\cancel{12 \text{ inches}}}$

The inches divide out and leave only feet. The second form does not have any units that will divide out and so will not help us.

### Example 2.1.16

MaryAnne is 66 inches tall. Convert her height into feet.

#### Solution

**Step 1: Multiply the measurement to be converted by 1; write 1 as a fraction relating the units given and the units needed.**

Multiply 66 inches by 1, writing 1 as a fraction relating inches and feet. We need inches in the denominator so that the inches will divide out!

$$66 \text{ inches} \times 1 = 66 \text{ inches} \times \frac{1 \text{ foot}}{12 \text{ inches}}$$

**Step 2: Multiply.**

$$\text{Think of 66 inches as } \frac{66 \text{ inches}}{1}$$

$$\frac{66 \text{ inches} \times 1 \text{ foot}}{12 \text{ inches}}$$

**Step 3: Simplify the fraction.**

Notice: inches divide out.

$$\cancel{66 \text{ inches}} \times \frac{1 \text{ foot}}{\cancel{12 \text{ inches}}} = \frac{66 \text{ inches}}{12}$$

**Step 4: Simplify.**

Divide 66 by 12.

*5.5 feet*

## Try It

17) Lexie is 30 inches tall. Convert her height to feet.

**Solution**

2.5 feet

18) Rene bought a hose that is 18 yards long. Convert the length to feet.

**Solution**

54 feet

## How To

### Make Unit Conversions.

1. Multiply the measurement to be converted by 1; write 1 as a fraction relating the units given and the units needed.
2. Multiply.
3. Simplify the fraction.
4. Simplify.

When we use the identity property of multiplication to convert units, we need to make sure the units we want to change from will divide out. Usually this means we want the conversion fraction to have those units in the denominator.

### Example 2.1.17

Eli's six months son is 102.4 ounces. Convert his weight to pounds.

**Solution**

To convert ounces into pounds we will multiply by conversion factors of 1.

**Step 1: Write 1 as**  $\frac{1 \text{ pound}}{16 \text{ ounces}}$ .

$$102.4 \text{ ounces} \times \frac{1 \text{ pound}}{16 \text{ ounces}}$$

**Step 2: Divide out the common units.**

$$102.4 \cancel{\text{ ounces}} \times \frac{1 \text{ pound}}{16 \cancel{\text{ ounces}}}$$

**Step 3: Simplify the fraction.**

$$\frac{102.4 \text{ ounces}}{16 \text{ ounces}}$$

**Step 4: Simplify.**

$$6.4 \text{ pounds}$$

Eli's six months son weights 6.4 pounds.

### Example 2.1.18

Ndula, an elephant at the San Diego Safari Park, weighs almost 3.2 tons. Convert her weight to pounds.

**Solution**

We will convert 3.2 tons into pounds. We will use the identity property of multiplication, writing 1 as the fraction:

$$\frac{2000 \text{ pounds}}{1 \text{ ton}}$$

**Step 1: Multiply the measurement to be converted, by 1.**

$$3.2 \text{ tons} \times 1$$

**Step 2: Write 1 as a fraction relating tons and pounds.**

$$3.2 \text{ tons} \times \frac{2,000 \text{ pounds}}{1 \text{ ton}}$$

**Step 3: Simplify.**

$$\frac{3.2 \cancel{\text{ tons}} \times 2,000 \text{ pounds}}{1 \cancel{\text{ ton}}}$$

**Step 4: Multiply.**

$$6,400 \text{ pounds}$$

## Try It

19) Arnold's SUV weighs about 4.3 tons. Convert the weight to pounds.

**Solution**

8,600 pounds

20) The Carnival *Destiny* cruise ship weighs 51,000 tons. Convert the weight to pounds.

**Solution**

102,000,000 pounds

21) One year old girl weighs 11 pounds. Convert her weight to ounces.

**Solution**

176 ounces.

As was the case with the metric system, sometimes, to convert from one unit to another, we may need to use several other units in between, so we will need to multiply several fractions.

### Example 2.1.19

Juliet is going with her family to their summer home. She will be away from her boyfriend for 9 weeks. Convert the time to minutes.

#### Solution

To convert weeks into minutes we will convert weeks into days, days into hours, and then hours into minutes. To do this we will multiply by conversion factors of 1.

**Step 1: Write 1 as**  $\frac{7 \text{ days}}{1 \text{ week}}$ ,  $\frac{24 \text{ hours}}{1 \text{ day}}$ , and  $\frac{60 \text{ minutes}}{1 \text{ hour}}$ .

$$\frac{9wk}{1} \times \frac{7days}{1wk} \times \frac{24hr}{1day} \times \frac{60min}{1hr}$$

**Step 2: Divide out the common units.**

$$\frac{9 \cancel{wk}}{1} \cdot \frac{7}{\cancel{days}} 1 \cancel{wk} \cdot \frac{24 \cancel{hr}}{1 \cancel{day}} \cdot \frac{60 \text{ min}}{1} \cancel{hr}$$

**Step 3: Multiply.**

$$\frac{9 \times 7 \times 24 \times 60 \text{ min}}{1 \times 1 \times 1 \times 1} = 90,720 \text{ minutes}$$

**Step 4: Multiply.**

Juliet and her boyfriend will be apart for 90,720 minutes (although it may seem like an eternity!).

## Try It

22) The distance between the earth and the moon is about 250,000 miles. Convert this length to yards.

### Solution

440,000,000 yards

23) The astronauts of Expedition 28 on the International Space Station spend 15 weeks in space. Convert the time to minutes.

### Solution

151,200 minutes

## Example 2.1.20

How many ounces are in 1 gallon?

### Solution

We will convert gallons to ounces by multiplying by several conversion factors. Refer to Table 2.1.5.

**Step 1: Multiply the measurement to be converted by 1.**

$$\frac{1 \text{ gallon}}{1} \times \frac{4 \text{ quarts}}{1 \text{ gallon}} \times \frac{2 \text{ pints}}{1 \text{ quart}} \times \frac{2 \text{ cups}}{1 \text{ pint}} \times \frac{8 \text{ ounces}}{1 \text{ cup}}$$

**Step 2: Use conversion factors to get to the right unit.**

Simplify.

$$\frac{1 \cancel{\text{ gallon}}}{1} \times \frac{4 \cancel{\text{ quarts}}}{1 \cancel{\text{ gallon}}} \times \frac{2 \cancel{\text{ pints}}}{1 \cancel{\text{ quart}}} \times \frac{2 \cancel{\text{ cups}}}{1 \cancel{\text{ pint}}} \times \frac{8 \text{ ounces}}{1 \cancel{\text{ cup}}}$$

**Step 3: Multiply.**

$$\frac{1 \times 4 \times 2 \times 2 \times 8 \text{ ounces}}{1 \times 1 \times 1 \times 1 \times 1}$$

**Step 4: Simplify.**

128 ounces

There are 128 ounces in a gallon.

## Try It

24) How many cups are in 1 gallon?

**Solution**

16 cups

25) How many teaspoons are in 1 cup?

**Solution**

48 teaspoons

## Use Mixed Units of Measurement in the U.S. System

We often use mixed units of measurement in everyday situations. Suppose Joe is 5 feet 10 inches tall, stays at work for 7 hours and 45 minutes, and then eats a 1 pound 2 ounce steak for dinner—all these measurements have mixed units.

Performing arithmetic operations on measurements with mixed units of measures requires care. Be sure to add or subtract like units!

**Example 2.1.21**

Seymour bought three steaks for a barbecue. Their weights were 14 ounces, 1 pound 2 ounces and 1 pound 6 ounces. How many total pounds of steak did he buy?

**Solution**

We will add the weights of the steaks to find the total weight of the steaks.

**Step 1: Add the ounces. Then add the pounds.**

$$\begin{array}{r}
 + 14 \text{ ounces} \\
 1 \text{ pound} + 2 \text{ ounces} \\
 1 \text{ pound} + 6 \text{ ounces} \\
 = 2 \text{ pounds} + 22 \text{ ounces}
 \end{array}$$

**Step 2: Convert 22 ounces to pounds and ounces.**

2 pounds 1 pound, 6 ounces.

**Step 3: Add the pounds.**

3 pounds, 6 ounces.

Seymour bought 3 pounds 6 ounces of steak.

**Try It**

26) Laura gave birth to triplets weighing 3 pounds 3 ounces, 3 pounds 3 ounces, and 2 pounds 9 ounces. What was the total birth weight of the three babies?

**Solution**

9 lbs. 8 oz

27) Stan cut two pieces of crown moulding for his family room that were 8 feet 7 inches and 12 feet 11 inches. What was the total length of the moulding?

**Solution**

21 ft. 6 in.

### Example 2.1.22

Anthony bought four planks of wood that were each 6 feet 4 inches long. What is the total length of the wood he purchased?

#### Solution

We will multiply the length of one plank to find the total length.

**Step 1: Multiply the inches and then the feet.**

$$\begin{array}{r} 6 \text{ feet } 4 \text{ inches} \\ \times \quad 4 \\ \hline 24 \text{ feet } 16 \text{ inches} \end{array}$$

**Step 2: Convert the 16 inches to feet.**

$$\begin{aligned} 16 \text{ inches} - 12 \text{ inches} &= 1 \text{ foot} + 4 \text{ inches} \\ 1 \text{ foot} + 4 \text{ inches} + 24 \text{ feet} &= 25 \text{ feet} + 4 \text{ inches} \end{aligned}$$

**Step 3: Add the feet.**

Anthony bought 25 feet and 4 inches of wood.

### Try It

28) Henri wants to triple his spaghetti sauce recipe that uses 1 pound 8 ounces of ground turkey. How many pounds of ground turkey will he need?

#### Solution

4 lbs. 8 oz.

29) Joellen wants to double a solution of 5 gallons 3 quarts. How many gallons of solution will she have in all?

**Solution**  
11 gallons 2 qt.

## Convert Between the U.S. and the Metric Systems of Measurement

Many measurements in the United States are made in metric units. The soda may come in 2-liter bottles, calcium may come in 500-mg capsules, and people may run a 5K race. To work easily in both systems, we need to be able to convert between the two systems.

The table below shows some of the most common conversions.

### Conversion Factors Between U.S. and Metric Systems

Table 2.1.6

Length	Mass	Capacity
1 in. = 2.54 cm	1 lb. = 0.45 kg	1 qt. = 0.95 L
1 ft. = 0.305 m	1 oz. = 28 g	1 fl. oz. = 30 mL
1 yd. = 0.914 m	1 kg = 2.2 lb.	1 L = 1.06 qt.
1 mi. = 1.61 km		
1 m = 3.28 ft.		

Figure 2.1.2 shows how inches and centimeters are related on a ruler.

Figure 2.1.5: This ruler shows inches and centimeters.

Figure 2.1.3 shows the ounce and milliliter markings on a measuring cup.

Figure 2.1.6: This measuring cup shows ounces and milliliters.

Figure 2.1.4 shows how pounds and kilograms marked on a bathroom scale.

Figure 2.1.7: This scale shows pounds and kilograms.

We make conversions between the systems just as we do within the systems—by multiplying by unit conversion factors.

### Example 2.1.23

The plastic bag used for transfusion holds 500 mL of packed red cells. How many ounces are in the bag? Round

to the nearest tenth of an ounce.

**Solution**

**Step 1: Multiply by a unit conversion factor relating mL and ounces.**

$$500 \text{ millilitres} \cdot \frac{1 \text{ ounce}}{30 \text{ millilitres}}$$

**Step 2: Simplify.**

$$\frac{50 \text{ ounces}}{30}$$

**Step 3: Divide.**

$$16.7 \text{ ounces}$$

The plastic bag has 16.7 ounces of packed red cells.

## Try It

30) Adam donated 450 ml of blood. How many ounces is that?

**Solution**

15 ounces.

31) How many quarts of soda are in a 2-L bottle?

**Solution**

2.12 quarts

32) How many liters are in 4 quarts of milk?

**Solution**

3.8 liters

**Example 2.1.24**

Soleil was on a road trip and saw a sign that said the next rest stop was in 100 kilometers. How many miles until the next rest stop?

**Solution**

**Step 1: Multiply by a unit conversion factor relating km and mi.**

$$100 \text{ kilometers} \cdot \frac{1 \text{ mile}}{1.61 \text{ kilometer}}$$

**Step 2: Simplify.**

$$\frac{100 \text{ miles}}{1.61}$$

**Step 3: Divide.**

$$62 \text{ miles}$$

Soleil will travel 62 miles.

**Example 2.1.25**

A human brain weights about 3 pounds. How many kilograms is that? Round to the nearest tenth of a kilogram.

**Solution**

**Step 1: Multiply by a unit conversion factor relating km and mi.**

$$3 \text{ pounds} \times \frac{1 \text{ kilogram}}{2.2 \text{ pounds}}$$

**Step 2: Simplify.**

$$\frac{3 \text{ kilograms}}{2.2}$$

**Step 3: Divide.**

1.4 kilograms

A human brain weights around 1.4 kilograms.

## Try It

33) A human liver normally weights approximately 1.5 kilograms. Convert it to pounds.

**Solution**

3.3 pounds

34) The height of Mount Kilimanjaro is 5,895 meters. Convert the height to feet.

**Solution**

19,335.6 feet

35) The flight distance from New York City to London is 5,586 kilometers. Convert the distance to miles.

**Solution**

8,993.46 km

## Convert between Fahrenheit and Celsius Temperatures

Have you ever been in a foreign country and heard the weather forecast? If the forecast is for 79°F what does that mean?

The U.S. and metric systems use different scales to measure temperature. The U.S. system uses degrees Fahrenheit, written °F The metric system uses degrees Celsius, written °C. Figure 2.1.5 shows the relationship

between the two systems. The diagram shows normal body temperature, along with the freezing and boiling temperatures of water in degrees Fahrenheit and degrees Celsius.

Figure 2.1.8

## Temperature Conversion

To convert from Fahrenheit temperature,  $F$ , to Celsius temperature,  $C$ , use the formula:

$$C = \frac{5}{9}(F - 32)$$

To convert from Celsius temperature,  $C$ , to Fahrenheit temperature,  $F$ , use the formula:

$$F = \frac{9}{5}C + 32$$

### Example 2.1.26

Convert  $50^\circ$  Fahrenheit into degrees Celsius.

#### **Solution**

We will substitute  $50^\circ\text{F}$  into the formula to find  $C$ .

**Step 1: Substitute 50 for F.**

$$C = \frac{5}{9}(50 - 32)$$

**Step 2: Simplify in parentheses.**

$$C = \frac{5}{9}(18)$$

**Step 3: Multiply.**

$$C = 10$$

So we found that  $50^\circ\text{F}$  is equivalent to  $10^\circ\text{C}$ .

### Example 2.1.27

Before mixing, the Pfizer-BioNTech COVID-19 vaccine may be stored in an ultra-cold freezer between  $-112^{\circ}\text{F}$  and  $-76^{\circ}\text{F}$ . Convert the temperatures into degrees Celsius.

#### **Solution**

We will substitute a)  $-112^{\circ}\text{F}$  and b)  $-76^{\circ}\text{F}$  into the formula to find C.

a.

**Step 1: Substitute  $-112$  for F.**

$$C = \frac{5}{9}(-112 - 32)$$

**Step 2: Simplify in parentheses.**

$$C = \frac{5}{9}(-144)$$

**Step 3: Multiply.**

$$C = -80$$

So we found that  $-112^{\circ}\text{F}$  is equivalent to  $-80^{\circ}\text{C}$

---

b.

**Step 1: Substitute  $-76$  for F.**

$$C = \frac{5}{9}(-76 - 32)$$

**Step 2: Simplify.**

$$C = \frac{5}{9}(-108)$$

$$C = -60$$

So we found that  $-76^{\circ}\text{F}$  is equivalent to  $-60^{\circ}\text{C}$ .

## Try It

36) Convert the Fahrenheit temperature to degrees Celsius: 59° Fahrenheit.

**Solution**

15°C

37) Convert the Fahrenheit temperature to degrees Celsius: 41° Fahrenheit.

**Solution**

5°C

## Example 2.1.28

While visiting Paris, Woody saw the temperature was 20° Celsius. Convert the temperature into degrees Fahrenheit.

**Solution**

We will substitute 20°C into the formula to find F.

**Step 1: Substitute 20 for C.**

$$F = \frac{9}{5}(20) 32$$

**Step 2: Multiply.**

$$F = 36 32$$

**Step 3: Add.**

$$F = 68$$

So we found that 20°C is equivalent to 68°F.

### Example 2.1.29

Once mixed, the Pfizer-BioNTech COVID-19 vaccine can be left at room temperature 2°C to 25°C. Convert the temperatures into degrees Fahrenheit.

**Solution**

We will substitute a) 2°C and b) 25°C into the formula to find F.

a.

**Step 1: Substitute 2 for C.**

$$F = \frac{9}{5} \times 232$$

**Step 2: Simplify.**

$$F = 35.6$$

So we found that 2°C is equivalent to 35.6°F.

---

b.

**Step 1: Substitute 25 for C.**

$$F = \frac{9}{5} \times 2532$$

**Step 2: Simplify.**

$$F = 77$$

So we found that 25°C is equivalent to 77°F.

## Try It

38) Convert the Celsius temperature to degrees Fahrenheit: the temperature in Helsinki, Finland, was  $15^{\circ}$  Celsius.

**Solution**

$59^{\circ}\text{F}$

39) Convert the Celsius temperature to degrees Fahrenheit: the temperature in Sydney, Australia, was  $10^{\circ}$  Celsius.

**Solution**

$50^{\circ}\text{F}$

## Key Concepts

- **Metric System of Measurement**

**Metric System of Measurement**

<b>Length</b>	<b>Mass</b>	<b>Capacity</b>
1 kilometer (km) = 1,000 m	1 kilogram (kg) = 1,000 g	1 kiloliter (kL) = 1,000 L
1 hectometer (hm) = 100 m	1 hectogram (hg) = 100 g	1 hectoliter (hL) = 100 L
1 dekameter (dam) = 10 m	1 dekagram (dag) = 10 g	1 dekaliter (daL) = 10 L
1 meter (m) = 1 m	1 gram (g) = 1 g	1 liter (L) = 1 L
1 decimeter (dm) = 0.1 m	1 decigram (dg) = 0.1 g	1 deciliter (dL) = 0.1 L
1 centimeter (cm) = 0.01 m	1 centigram (cg) = 0.01 g	1 centiliter (cL) = 0.01 L
1 millimeter (mm) = 0.001 m	1 milligram (mg) = 0.001 g	1 milliliter (mL) = 0.001 L
1 meter = 100 centimeters	1 gram = 100 centigrams	1 liter = 100 centiliters
1 meter = 1,000 millimeters	1 gram = 1,000 milligrams	1 liter = 1,000 milliliters

### • Temperature Conversion

- To convert from Fahrenheit temperature,  $F$ , to Celsius temperature,  $C$ , use the formula

$$C = \frac{5}{9}(F - 32)$$

- To convert from Celsius temperature,  $C$ , to Fahrenheit temperature,  $F$ , use the formula

$$F = \frac{9}{5}C + 32$$

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it*

— online here:

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=6020#h5p-34>

Overall, after looking at the checklist, do you think you are well-prepared for the next Chapter?  
Why or why not?

## 2.2 ACCURACY, PRECISION, AND ROUNDING RULES

---

### Learning Objectives

By the end of this section, you will be able to:

- Identify exact and inexact numbers.
- Recognize the number of significant figures in a given quantity.
- Identify the number of decimal places.
- Understand the difference between accuracy and precision.
- Calculate the percent uncertainty of a measurement.
- Apply the concept of significant figures to limit mathematical results to the proper number of digits.

### Exact and Inexact Numbers

When considering measurement, we must consider the nature of the numbers that we are using in our calculations.

A number is exact if it is known with complete certainty. An exact number is a number that you can get by counting. Exact numbers have infinitely many significant figures and decimal places. For example, there are exactly 100 centimeters in one meter and exactly 4 quarts in a gallon.

A number is inexact if it has **uncertainty** associated with it. This uncertainty can arise due to measurement or rounding. Some examples would be a person's height or weight.

## Accuracy and Precision of a Measurement

Science is based on observation and experiment—that is, on measurements. **Accuracy** is how close a measurement is to the correct value for that measurement. For example, let us say that you are measuring the length of standard computer paper. The packaging in which you purchased the paper states that it is 11.0 inches long. You measure the length of the paper three times and obtain the following measurements: 11.1 in., 11.2 in., and 10.9 in. These measurements are quite accurate because they are very close to the correct value of 11.0 inches. In contrast, if you had obtained a measurement of 12 inches, your measurement would not be very accurate.

The **precision** of a measurement system refers to how close the agreement is between repeated measurements (which are repeated under the same conditions). Consider the example of the paper measurements. The precision of the measurements refers to the spread of the measured values. One way to analyze the precision of the measurements would be to determine the range, or difference, between the lowest and the highest measured values. In that case, the lowest value was 10.9 in. and the highest value was 11.2 in. Thus, the measured values deviated from each other by at most 0.3 in. These measurements were relatively precise because they did not vary too much in value. However, if the measured values had been 10.9, 11.1, and 11.9, then the measurements would not be very precise because there would be significant variation from one measurement to another.

The measurements in the paper example are both accurate and precise, but in some cases, measurements are accurate but not precise, or they are precise but not accurate. Let us consider an example of a GPS system that is attempting to locate the position of a restaurant in a city. Think of the restaurant location as existing at the centre of a bull's-eye target, and think of each GPS attempt to locate the restaurant as a black dot. In Figure 2.2.1 you can see that the GPS measurements are spread out far apart from each other, but they are all relatively close to the actual location of the restaurant at the centre of the target. This indicates a low precision, high accuracy measuring system. However, in Figure 2.2.2 the GPS measurements are concentrated quite closely to one another, but they are far away from the target location. This indicates a high precision, low accuracy measuring system.

Figure 2.2.1. A GPS system attempts to locate a restaurant at the center of the bull's-eye. The black dots represent each attempt to pinpoint the location of the restaurant. The dots are spread out quite far apart from one another, indicating low precision, but they are each rather close to the actual location of the restaurant, indicating high accuracy. (credit: Dark Evil).

Figure 2.2.2. In this figure, the dots are concentrated rather closely to one another, indicating high precision, but they are rather far away from the actual location of the restaurant, indicating low accuracy. (credit: Dark Evil).

## Accuracy, Precision, and Uncertainty

The degree of accuracy and precision of a measuring system are related to the **uncertainty** in the measurements. Uncertainty is a quantitative measure of how much your measured values deviate from a standard or expected value. If your measurements are not very accurate or precise, then the uncertainty of your values will be very high. In more general terms, uncertainty can be thought of as a disclaimer for your measured values. For example, if someone asked you to provide the mileage on your car, you might say that it is 45,000 miles, plus or minus 500 miles. The plus or minus amount is the uncertainty in your value. That is, you are indicating that the actual mileage of your car might be as low as 44,500 miles or as high as 45,500 miles, or anywhere in between. All measurements contain some amount of uncertainty. In our example of measuring the length of the paper, we might say that the length of the paper is 11 in., plus or minus 0.2 in. The uncertainty in a measurement,  $A$ , is often denoted as  $\delta A$  (“delta  $A$ ”), so the measurement result would be recorded as  $A \pm \delta A$ . In our paper example, the length of the paper could be expressed as  $11\text{ in.} \pm 0.2$ .

**The factors contributing to uncertainty in a measurement include:**

1. Limitations of the measuring device,
2. The skill of the person making the measurement,
3. Irregularities in the object being measured,
4. Any other factors that affect the outcome (highly dependent on the situation).

In our example, such factors contributing to the uncertainty could be the following: the smallest division on the ruler is 0.1 in., the person using the ruler has bad eyesight, or one side of the paper is slightly longer than the other. At any rate, the uncertainty in a measurement must be based on a careful consideration of all the factors that might contribute and their possible effects.

**Making Connections: Real World Connections – Fever or Chills?**

Uncertainty is a critical piece of information, both in physics and in many other real-world applications. Imagine you are caring for a sick child. You suspect the child has a fever, so you check his or her temperature with a thermometer. What if the uncertainty of the thermometer were 3.0 °C? If the child's temperature reading was 37.0 °C (which is normal body temperature), the "true" temperature could be anywhere from a hypothermic 34.0 °C to a dangerously high 40.0 °C. A thermometer with an uncertainty of 3.0 °C would be useless.

**Percent Uncertainty**

One method of expressing uncertainty is as a percent of the measured value. If a measurement  $A$  is expressed with *uncertainty*,  $\delta A$ , the **percent uncertainty** (%unc) is defined to be:

$$\% \text{ unc} = \frac{\delta A}{A} \times 100\%$$

### Example 2.2.1

A grocery store sells 5-lb bags of apples. You purchase four bags over the course of a month and weigh the apples each time. You obtain the following measurements:

- Week 1 weight: **4.8 lb**
- Week 2 weight: **5.3 lb**
- Week 3 weight: **4.9 lb**
- Week 4 weight: **5.4 lb**

You determine that the weight of the 5-lb bag has an uncertainty of  $\pm 0.4$  lb. What is the percent uncertainty of the bag's weight?

#### Strategy

First, observe that the expected value of the bag's weight,  $A$ , is 5 lb. The uncertainty in this value,  $\delta A$ , is 0.4 lb. We can use the following equation to determine the percent uncertainty of the weight:

$$\% \text{ unc} = \frac{\delta A}{A} \times 100\%$$

#### Solution

Plug the known values into the equation:

$$\begin{aligned} \% \text{ unc} &= \frac{0.4 \text{ lb}}{5 \text{ lb}} \times 100\% \\ \% \text{ unc} &= 8\% \end{aligned}$$

#### Discussion

We can conclude that the weight of the apple bag is 5 lb  $\pm 8\%$ . Consider how this percent uncertainty would change if the bag of apples were half as heavy, but the uncertainty in the weight remained the same. Hint for future calculations: when calculating percent uncertainty, always remember that you must multiply the fraction by 100%. If you do not do this, you will have a decimal quantity, not a percent value.

## Uncertainties in Calculations

There is an uncertainty in anything calculated from measured quantities. For example, the area of a floor calculated from measurements of its length and width has an uncertainty because the length and width have uncertainties. How big is the uncertainty in something you calculate by multiplication or division? If the measurements going into the calculation have small uncertainties (a few percent or less), then the **method of adding percents** can be used for multiplication or division. This method says that *the percent uncertainty in a quantity calculated by multiplication or division is the sum of the percent uncertainties in the items used to make the calculation*. For example, if a floor has a length of 4.00 m and a width of 3.00 m, with uncertainties of 2% and 1%, respectively, then the area of the floor is 12.0 m and has an uncertainty of 3%. (Expressed as an area this is  $0.36 \text{ m}^2$ , which we round to  $0.4 \text{ m}^2$  since the area of the floor is given to a tenth of a square meter.)

### Try It

1) A high school track coach has just purchased a new stopwatch. The stopwatch manual states that the stopwatch has an uncertainty of  $\pm 0.05 \text{ s}$ . Runners on the track coach's team regularly clock 100-m sprints of 11.49 s to 15.01 s. At the school's last track meet, the first-place sprinter came in at 12.04 s and the second-place sprinter came in at 12.07 s. Will the coach's new stopwatch be helpful in timing the sprint team? Why or why not?

#### Solution

No, the uncertainty in the stopwatch is too great to effectively differentiate between the sprint times.

## Precision of Measuring Tools and Significant Figures

An important factor in the accuracy and precision of measurements involves the precision of the measuring tool. In general, a precise measuring tool is one that can measure values in very small increments. For example, a standard ruler can measure length to the nearest millimeter, while a caliper can measure length to the nearest 0.01 millimeter. The caliper is a more precise measuring tool because it can measure extremely small differences in length. The more precise the measuring tool, the more precise and accurate the measurements can be.

When we express measured values, we can only list as many digits as we initially measured with our

measuring tool. For example, if you use a standard ruler to measure the length of a stick, you may measure it to be 36.7 cm. You could not express this value as 36.71 cm because your measuring tool was not precise enough to measure a hundredth of a centimeter. It should be noted that the last digit in a measured value has been estimated in some way by the person performing the measurement. For example, the person measuring the length of a stick with a ruler notices that the stick length seems to be somewhere in between 36.6 cm and 36.7 cm, and he or she must estimate the value of the last digit. Using the method of significant figures, the rule is that *the last digit written down in a measurement is the first digit with some uncertainty*. In order to determine the number of significant digits in a value, start with the first measured value at the left and count the number of digits through the last digit written on the right. For example, the measured value 36.7 cm has three digits, or significant figures. Significant figures indicate the precision of a measuring tool that was used to measure a value.

## Significant Figures: Zeros

Special consideration is given to zeros when counting significant figures. The zeros in 0.053 are not significant, because they are only placekeepers that locate the decimal point. There are two significant figures in 0.053. The zeros in 10.053 are not placekeepers but are significant—this number has five significant figures. The zeros in 1300 may or may not be significant depending on the style of writing numbers. They could mean the number is known to the last digit, or they could be placekeepers. So 1300 could have two, three, or four significant figures. (To avoid this ambiguity, write 1300 in scientific notation.) *Zeros are significant except when they serve only as placekeepers.*

### Try It

2) Determine the number of significant figures in the following measurements:

- a) 0.0009
- b) 15,450.0
- c)  $6 \times 10^3$
- d) 87.990
- e) 30.42

### Solution

- a) 1
- b) 6
- c) 1
- d) 5
- e) 4

As you have probably realized by now, the biggest issue in determining the number of significant figures in a value is the zero. Is the zero significant or not? One way to unambiguously determine whether a zero is significant or not is to write a number in scientific notation. Scientific notation will include zeros in the coefficient of the number *only if they are significant*. Thus, the number  $8.666 \times 10^6$  has four significant figures. However, the number  $8.6660 \times 10^6$  has five significant figures. That last zero is significant; if it were not, it would not be written in the coefficient. So when in doubt about expressing the number of significant figures in a quantity, use scientific notation and include the number of zeros that are truly significant. We will learn more about scientific notation in a later section in the text.

## Significant Figures

If you use a calculator to evaluate the expression  $\frac{337}{217}$ , you will get the following:

$$\frac{337}{217} = 1.55299539171...$$

and so on for many more digits. Although this answer is correct, it is somewhat presumptuous. You start with two values that each have three digits, and the answer has *twelve* digits? That does not make much sense from a strict numerical point of view.

Consider using a ruler to measure the width of an object, as shown in Figure 2.2.3 “Expressing Width”. The object is definitely more than 1 cm long, so we know that the first digit in our measurement is 1. We see by counting the tick marks on the ruler that the object is at least three ticks after the 1. If each tick represents 0.1 cm, then we know the object is at least 1.3 cm wide. But our ruler does not have any more ticks between the 0.3 and the 0.4 marks, so we can’t know exactly how much the next decimal place is. But with a practised eye we can estimate it. Let us estimate it as about six-tenths of the way between the third and fourth tick marks, which estimates our hundredths place as 6, so we identify a measurement of 1.36 cm for the width of the object.

Figure 2.2.3. Expressing Width

What is the proper way to express the width of this object?

Does it make any sense to try to report a thousandths place for the measurement? No, it doesn't; we are not exactly sure of the hundredths place (after all, it was an estimate only), so it would be fruitless to estimate a thousandths place. Our best measurement, then, stops at the hundredths place, and we report 1.36 cm as proper measurement.

This concept of reporting the proper number of digits in a measurement or a calculation is called **significant figures**. Significant figures (sometimes called significant digits) represent the limits of what values of a measurement or a calculation we are sure of. The convention for a measurement is that the quantity reported should be all known values and the first estimated value. The conventions for calculations are discussed as follows.

### Example 2.2.2

Use each diagram to report a measurement to the proper number of significant figures.

Figure 2.2.4. Pressure gauge in units of pounds per square inch

Figure 2.2.5. A measuring ruler

### Solution

- The arrow is between 4.0 and 5.0, so the measurement is at least 4.0. The arrow is between the third and fourth small tick marks, so it's at least 0.3. We will have to estimate the last place. It looks like about one-third of the way across the space, so let us estimate the hundredths place as 3. Combining the digits, we have a measurement of 4.33 psi (psi stands for "pounds per square inch" and is a unit of pressure, like air in a tire). We say that the measurement is reported to three significant figures.
- The rectangle is at least 1.0 cm wide but certainly not 2.0 cm wide, so the first significant digit is 1. The rectangle's width is past the second tick mark but not the third; if each tick mark represents 0.1, then the rectangle is at least 0.2 in the next significant digit. We have to

estimate the next place because there are no markings to guide us. It appears to be about halfway between 0.2 and 0.3, so we will estimate the next place to be a 5. Thus, the measured width of the rectangle is 1.25 cm. Again, the measurement is reported to three significant figures

## Try It

3) What would be the reported width of this rectangle?

Figure 2.2.6. A measuring ruler

### Solution

0.63cm

In many cases, you will be given a measurement. How can you tell by looking what digits are significant? For example, the reported population of the United States is 306,000,000. Does that mean that it is *exactly* three hundred six million or is some estimation occurring?

The following conventions dictate which numbers in a reported measurement are significant and which are not significant:

1. Any nonzero digit is significant.
2. Any zeros between nonzero digits (i.e., embedded zeros) are significant.
3. Zeros at the end of a number:
  - without a decimal point (i.e., trailing zeros) are not significant; they serve only to put the significant digits in the correct positions.
  - with a decimal point are significant.
4. Zeros at the beginning of a decimal number (i.e., leading zeros) are not significant; again, they serve only to put the significant digits in the correct positions.

So, by these rules, the population figure of the United States has only three significant figures: the 3, the 6, and the zero between them. The remaining six zeros simply put the 306 in the millions position.

### Example 2.2.3

Give the number of significant figures in each measurement.

- a. 36.7 m
- b. 0.006606 s
- c. 2,002 kg
- d. 306,490,000 people

#### Solution

- a. By rule 1, all nonzero digits are significant, so this measurement has three significant figures.
- b. By rule 4, the first three zeros are not significant, but by rule 2 the zero between the sixes is; therefore, this number has four significant figures.

- c. By rule 2, the two zeros between the twos are significant, so this measurement has four significant figures.
- d. The four trailing zeros in the number are not significant, but the other five numbers are, so this number has five significant figures.

## Try It

Give the number of significant figures in each measurement.

4) 0.000601 m

**Solution**

3 significant figures

5) 65.080 kg

**Solution**

5 significant figures

## Significant Figures in Calculations

How are significant figures handled in calculations? It depends on what type of calculation is being performed. If the calculation is an addition or a subtraction, the rule is as follows: limit the reported answer to the rightmost column that all numbers have significant figures in common. For example, if you were to add 1.2 and 4.71, we note that the first number stops its significant figures in the tenths column, while the second number stops its significant figures in the hundredths column. We therefore limit our answer to the tenths column.

$$\begin{array}{r}
 1.2 \\
 \underline{4.41} \\
 5.61 \\
 \uparrow \text{limit final answer to the tenths column: } 5.6
 \end{array}$$

Figure 2.2.7.

We drop the last digit—the 1—because it is not significant to the final answer.

The dropping of positions in sums and differences brings up the topic of rounding. Although there are several conventions, in this text we will adopt the following rule: the final answer should be rounded up if the first dropped digit is 5 or greater and rounded down if the first dropped digit is less than 5.

$$\begin{array}{r}
 77.2 \\
 \underline{10.46} \\
 87.66 \\
 \uparrow \text{limit final answer to the tenths column and round up: } 87.7
 \end{array}$$

Figure 2.2.8.

### Example 2.2.4

Express the final answer to the proper number of significant figures.

- $101.2 + 18.702 = ?$
- $202.88 - 1.013 = ?$

#### Solution

- If we use a calculator to add these two numbers, we would get 119.902. However, most calculators do not understand significant figures, and we need to limit the final answer to the tenths place. Thus, we drop the 02 and report a final answer of 119.9 (rounding down).
- A calculator would answer 201.867. However, we have to limit our final answer to the hundredths place. Because the first number being dropped is 7, which is greater than 5, we

round up and report a final answer of 201.87.

## Try It

6) Express the answer for  $3.445 + 90.83 - 72.4$  to the proper number of significant figures.

**Solution**

21.9

If the operations being performed are multiplication or division, the rule is as follows: limit the answer to the number of significant figures that the data value with the *least* number of significant figures has. So if we are dividing 23 by 448, which have two and three significant figures each, we should limit the final reported answer to two significant figures (the lesser of two and three significant figures):

$$\frac{23}{448} = 0.051339286... = 0.051$$

The same rounding rules apply in multiplication and division as they do in addition and subtraction.

## Example 2.2.5

Express the final answer to the proper number of significant figures.

- a.  $76.4 \times 180.4 = ?$
- b.  $934.9 \div 0.00455 = ?$

**Solution**

a. The first number has three significant figures, while the second number has four significant figures. Therefore, we limit our final answer to three significant figures:

$$76.4 \times 180.4 = 13,782.56 = 13,800.$$

---

b. The first number has four significant figures, while the second number has three significant figures. Therefore we limit our final answer to three significant figures:

$$934.9 \div 0.00455 = 205,472.5275 \dots = 205,000.$$

## Try It

Express the final answer to the proper number of significant figures.

7)  $22.4 \times 8.314 = ?$

**Solution**

186

8)  $1.381 \div 6.02 = ?$

**Solution**

0.229

If we have to evaluate a problem with mixed operations (addition/subtraction and multiplication/division), we need to round according to the rounding rules above as we go through the operations in the order of operations.

### Example 2.2.6

Express the final answer to the proper number of significant figures.

- $(93.29 - 19.2) \times 1.2 = ?$
- $810.0 \div 2.43 + 2.4 = ?$

#### Solution

- By the order of operations, we need to perform the subtraction first. Calculating this result would give 74.09 but we can only give our answer to the nearest tenth, so we need to round to 74.1. Then, we need to multiply 74.1 by 1.2 which gives 88.92 and we need to report this answer with two significant figures. Our answer is 89.
- By the order of operations, we need to perform the division first. This gives us  $333.\bar{3}$ . Since 2.43 only has 3 significant figures, we need to limit our result to 3 significant figures, which gives us 333. Then, we need to add 2.4 to get 335.4. Finally, we need to give our answer to the nearest unit, and so our answer is 335.

## Summary

When combining measurements with different degrees of accuracy and precision, *the number of significant digits in the final answer can be no greater than the number of significant digits in the least precise measured value*. There are two different rules, one for multiplication and division and the other for addition and subtraction, as discussed below.

**1. For multiplication and division:** *The result should have the same number of significant figures as the quantity having the least significant figures entering into the calculation.* For example, the area of a circle can be calculated from its radius using  $A = \pi r^2$ . Let us see how many significant figures the area has if the radius has only two—say,  $r = 1.2\text{ m}$ . Then,

$$A = \pi r^2 = 3.1415927 \times (1.2\text{ m})^2 = 4.5238934\text{ m}^2$$

is what you would get using a calculator that has an eight-digit output. But because the radius has only two significant figures, it limits the calculated quantity to two significant figures or

$$A = \pi r^2 = 3.1415927 \times (1.2\text{ m})^2 = 4.52\text{ m}^2$$

even though  $\pi$  is good to at least eight digits.

**2. For addition and subtraction:** *The answer can contain no more decimal places than the least precise measurement.* Suppose that you buy 7.56-kg of potatoes in a grocery store as measured with a scale with precision 0.01 kg. Then you drop off 6.052-kg of potatoes at your laboratory as measured by a scale with precision 0.001 kg. Finally, you go home and add 13.7 kg of potatoes as measured by a bathroom scale with precision 0.1 kg. How many kilograms of potatoes do you now have, and how many significant figures are appropriate in the answer? The mass is found by simple addition and subtraction:

$$\begin{array}{r} 7.56\text{kg} \\ -6.052\text{kg} \\ + 13.7\text{kg} \\ \hline 15.208\text{kg} = 15.2\text{kg} \end{array}$$

Next, we identify the least precise measurement: 13.7 kg. This measurement is expressed to the 0.1 decimal place, so our final answer must also be expressed to the 0.1 decimal place. Thus, the answer is rounded to the tenths place, giving us 15.2 kg.

**3. For mixed operations:** Round according to the rules above while following the order of operations for the calculations required. For example, perform the following operations and round to the appropriate number of significant figures.

$$(3.495 + 12.45) \div 2.4$$

We must add the values within the parentheses first, giving us 15.945. However, 12.45 is only precise to the nearest hundredth and so we need to round this result to the nearest hundredth, giving us 15.95. Then, we need to divide that by 2.4, which yields  $6.6458\bar{3}$ . Since 15.95 has four significant figures, and 2.4 only has two significant figures, we must round the answer to two significant figures, 6.6.

## Rounding in Practical Situations

It is important to note that the rounding rules above are the theoretical rules used in chemical and physical laboratory papers and results. In various health care professions, the precision of the measurement tool being used will often dictate how you would round your medication dosages. In this sense, it is important to understand these theoretical rules and be aware that in practical situations, you may be taught best practices to coincide with the measurement tools available to you.

## Key Concepts:

- Accuracy of a measured value refers to how close a measurement is to the correct value. The uncertainty in a measurement is an estimate of the amount by which the measurement result may differ from this value.
- Precision of measured values refers to how close the agreement is between repeated measurements.
- The precision of a *measuring tool* is related to the size of its measurement increments. The smaller the measurement increment, the more precise the tool.
- Significant figures express the precision of a measuring tool.
- Significant figures in a quantity indicate the number of known values plus one place that is estimated.
- The following conventions dictate which numbers in a reported measurement are significant and which are not significant:
  1. Any nonzero digit is significant.
  2. Any zeros between nonzero digits (i.e., embedded zeros) are significant.
  3. Zeros at the end of a number without a decimal point (i.e., trailing zeros) are not significant; they serve only to put the significant digits in the correct positions. However, zeros at the end of any number with a decimal point are significant.
  4. Zeros at the beginning of a decimal number (i.e., leading zeros) are not significant; again, they serve only to put the significant digits in the correct positions.
- When multiplying or dividing measured values, the final answer can contain only as many significant figures as the least precise value.
- When adding or subtracting measured values, the final answer cannot contain more decimal places than the least precise value.
- When performing mixed operations, round according to the rules for addition/subtraction and multiplication/division while using the order of operations.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

An interactive H5P element has been excluded from this version of the text. You can view it online here:

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=6816#h5p-36>

Overall, after looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

## Glossary

### **accuracy**

the degree to which a measure value agrees with the correct value for that measurement

### **method of adding percents**

the percent uncertainty in a quantity calculated by multiplication or division is the sum of the percent uncertainties in the items used to make the calculation

### **percent uncertainty**

the ratio of the uncertainty of a measurement to the measured value, expressed as a percentage

### **precision**

the degree to which repeated measurements agree with each other

### **significant figures**

express the precision of a measuring tool used to measure a value

### **uncertainty**

a quantitative measure of how much your measured values deviate from a standard or expected value

## 2.3 SCIENTIFIC NOTATION

---

### Learning Objectives

By the end of this section, you will be able to:

- Recall the Laws of Exponents
- Convert from decimal notation to scientific notation
- Convert scientific notation to decimal form
- Multiply and divide using scientific notation

### Try It

Before you get started, take this readiness quiz:

- 1) What is the place value of the 6 in the number **64,891**?
- 2) Name the decimal: **0.0012**.
- 3) Subtract:  **$5 - (-3)$** .

### Review of the Exponent Properties

If  $a$  and  $b$  are real numbers, and  $m$  and  $n$  are integers, then:

---

Product Property	$\frac{a^m}{a^n} = a^{m+n}$
Power Property	$(a^m)^n = a^{mn}$
Product to a Power	$(ab)^m = a^m b^m$
Quotient Property	$\frac{a^m}{a^n} = a^{m-n}$ if $m > n$ and $\frac{a^m}{a^n} = \frac{1}{a^{n-m}}$ , if $n > m$ , $a \neq 0$
Zero Exponent Property	$a^0 = 1, a \neq 0$
Quotient to a Power Property	$a^{-n} = \frac{1}{a^n}$ and $\frac{1}{a^{-n}} = a^n, a \neq 0$
Quotient to a Negative Exponent	$\left(\frac{a}{b}\right)^{-n} = \left(\frac{b}{a}\right)^n$

---

## Scientific Notation

Sometimes, in real-life scenarios, we may need to deal with numbers that are very large, or numbers that are very small. Thus, when dealing with numbers like 1, 280, 000, 000 or 0.00000000274, it may be beneficial to represent these numbers in a different way. We will use scientific notation to help us with this.

## Scientific Notation and Significant Figures

Before we work on converting between forms of numbers, let's consider the concept of significant figures and scientific notation. We can determine the number of significant figures in a number in scientific notation in the same way we would a number in decimal notation. Let's remind ourselves of the rules for significant figures that were covered in the previous section:

The following conventions dictate which numbers in a reported measurement are significant and which are not significant:

1. Any nonzero digit is significant.
2. Any zeros between nonzero digits (i.e., embedded zeros) are significant.

3. Zeros at the end of a number without a decimal point (i.e., trailing zeros) are not significant; they serve only to put the significant digits in the correct positions. However, zeros at the end of any number with a decimal point are significant.
4. Zeros at the beginning of a decimal number (i.e., leading zeros) are not significant; again, they serve only to put the significant digits in the correct positions.

Of course, in scientific notation, we no longer have to worry about leading zeros. This is one of the benefits of using scientific notation, as the digits present are always significant.

### Example 2.3.1

Determine the number of significant figures in the following numbers:

- a.  $1.41 \times 10^3$
- b.  $1.034 \times 10^{-5}$
- c.  $4.0000 \times 10^{-2}$

#### **Solution**

- a. All non-zero digits are significant so there are 3 significant figures.
- b. All confined zeros are significant, as well as all non-zero digits, so there are 4 significant figures.
- c. All zeros at the end of the number after a decimal point are significant, so there are 5 significant figures.

## Try It

4) Determine the number of significant figures in the following numbers:

a.  $1.9 \times 10^3$

b.  $4.00 \times 10^{-5}$

c.  $5.001 \times 10^{-2}$

### Solution

a. 2 significant figures

b. 3 significant figures

c. 4 significant figures

## Convert from Decimal Notation to Scientific Notation

Remember working with place value for whole numbers and decimals? Our number system is based on powers of 10. We use tens, hundreds, thousands, and so on. Our decimal numbers are also based on powers of tens—tenths, hundredths, thousandths, and so on. Consider the numbers 4,000 and 0.004. We know that

$$4,000 \text{ means } 4 \times 1000 \text{ and } 0.004 \text{ means } 4 \times \frac{1}{1,000}$$

If we write the 1000 as a power of ten in exponential form, we can rewrite these numbers in this way:

<hr style="border: 0; border-top: 1px solid black; margin-bottom: 10px;"/> <div style="margin-bottom: 10px;">4000</div> <div style="margin-bottom: 10px;"><math>4 \times 1000</math></div> <div><math>4 \times 10^3</math></div>	<hr style="border: 0; border-top: 1px solid black; margin-bottom: 10px;"/> <div style="margin-bottom: 10px;">0.004</div> <div style="margin-bottom: 10px;"><math>4 \times \frac{1}{1000}</math></div> <div><math>4 \times \frac{1}{10^3} = 4 \times 10^{-3}</math></div> <hr style="border: 0; border-top: 1px solid black; margin-top: 10px;"/>
--	--

When a number is written as a product of two numbers, where the first factor is a number greater than or equal to one but less than 10, and the second factor is a power of 10 written in exponential form, it is said to be in **scientific notation**.

## Scientific Notation

A number is in scientific notation if it is in the form  $M \times 10^n$  where  $1 \leq M < 10$ .

It is customary in scientific notation to use as the  $\times$  multiplication sign, even though we avoid using this sign elsewhere in algebra.

If we look at what happened to the decimal point, we can see a method to easily convert from decimal notation to scientific notation.

$$4 \times 10^3 = \text{Decimal moved 3 to the right. } 4 \overset{\rightarrow}{.} 0_1 0_2 0_3 = 4000.$$

$$4 \times 10^{-3} = \text{Decimal moved 3 to the left. } 0_3 0_2 0_1 4 \overset{\leftarrow}{.} = 0.004$$

In both cases, the decimal was moved 3 places to get the first factor between 1 and 10.

The power of 10 is positive when the number is larger than 1:  $4,000 = 4 \times 10^3$

The power of 10 is negative when the number is between 0 and 1:  $0.004 = 4 \times 10^{-3}$

### Example 2.3.2

Write in scientific notation: 37,000.

#### Solution

**Step 1: Move the decimal point so that the first factor is greater than or equal to 1 but less than 10.**

Remember, there is a decimal at the end of 37,000.

Move the decimal after the 3. 3.700 is between 1 and 10.

**Step 2: Count the number of decimal places,  $n$ , that the decimal point was moved.**

The decimal place was moved 4 places to the left.

$$\text{Decimal moved 4 to the left. } 3_4 7_3 0_2 0_1 0 \overset{\leftarrow}{.} = 3.7$$

**Step 3: Write the number as a product with a power of 10.**

If the original number is:

Greater than 1, the power of 10 will be  $10^a$ .

Between 0 and 1, the power of 10 will be  $10^{-a}$ .

37,000 is greater than 1 so the power of 10 will have exponent 4.

$$3.7 \times 10^4$$

**Step 4: Check to see if your answer makes sense.**

$10^4$  is 10,000 and 10,000 times 3.7 will be 37,000.

$$3.7 \times 10^4 = 37,000$$

## Try It

5) Write in scientific notation: 96,000.

**Solution**

$$9.6 \times 10^4$$

6) Write in scientific notation: 48,300.

**Solution**

$$4.83 \times 10^4$$

7) Write in scientific notation: 54,000

**Solution**

$$5.40 \times 10^4$$

## HOW TO

### Convert from decimal notation to scientific notation

1. Move the decimal point so that the first factor is greater than or equal to 1 but less than 10.
2. Count the number of decimal places,  $n$ , that the decimal point was moved.
3. Write the number as a product with a power of 10.

If the original number is:

- greater than 1, the power of 10 will be  $10^n$ .
- between 0 and 1, the power of 10 will be  $10^{-n}$ .

4. Check.

### Example 2.3.3

Write in scientific notation: 0.0052

#### Solution

The original number, 0.0052, is between 0 and 1 so we will have a negative power of 10.

**Step 1: Move the decimal point to get 5.2, a number between 1 and 10.**

$$0.0\uparrow 0\uparrow 5\uparrow 2 = 5.2$$

**Step 2: Count the number of decimal places the point was moved.**

$$0.0\underset{1}{\underset{2}{0}}\underset{3}{5}2 = \text{The decimal was moved } \mathbf{3} \text{ places.}$$

**Step 3: Write as a product with a power of 10.**

$$5.2 \times 10^{-3}$$

**Step 4: Check.**

$$\begin{aligned} 5.2 \times 10^{-3} \\ 5.2 \times \frac{1}{10^3} \\ 5.2 \times \frac{1}{1000} \\ 5.2 \times 0.001 &= 0.0052 \\ 0.0052 &= 5.2 \times 10^{-3} \end{aligned}$$

**Try It**

8) Write in scientific notation: 0.0078

**Solution**

$$7.8 \times 10^{-3}$$

9) Write in scientific notation: 0.0129

**Solution**

$$1.29 \times 10^{-2}$$

## Preserving Significant Zeros Using Scientific Notation

As we saw in the previous section, when considering a number with trailing zeros, it is not easy to determine whether or not they are significant. For example, the number 10,000 could have one significant figure only, but it is possible that some of the zeros are significant as well. One way to communicate a significant zero, when there is no decimal present, is to use a tilde to indicate its significance. For instance, 10,00̃0 indicates that the third zero is significant, which makes the zeros in between significant as well. In this sense, this number 10,00̃0 has 4 significant figures. If we wanted to put this number into scientific notation, we would need to include those significant zeros and it would be represented by  $1.000 \times 10^4$ .

**Try It**

10) Convert the following numbers to scientific notation. Be sure to preserve the number of significant figures.

a. 0.002840

b. 129.00

c. 18000

**Solution**

a.  $2.840 \times 10^{-3}$

b.  $1.2900 \times 10^2$

c.  $1.8000 \times 10^4$

## Convert Scientific Notation to Decimal Form

How can we convert from scientific notation to decimal form? Let's look at two numbers written in scientific notation and see.

$$9.12 \times 10^4$$

$$9.12 \times 10^{-4}$$

$$9.12 \times 10,000$$

$$9.12 \times 0.0001$$

$$91,200 \times 0.000912$$

If we look at the location of the decimal point, we can see an easy method to convert a number from scientific notation to decimal form.

$$9.12 \times 10^4 = \text{Move the decimal 4 to the right. } 9.\overset{\rightarrow}{1}120304 = 91,200.$$

$$9.12 \times 10^{-4} = \text{Move the decimal 4 to the left. } = 040302019\overset{\leftarrow}{.}12 = 0.000912$$

In both cases the decimal point moved 4 places. When the exponent was positive, the decimal moved to the right. When the exponent was negative, the decimal point moved to the left.

### Example 2.3.4

Convert to decimal form:  $6.2 \times 10^3$

**Solution**

**Step 1: Determine the exponent,  $n$ , on the factor 10.**

The exponent is 3.

$$6.2 \times 10^3$$

**Step 2: Move the decimal  $n$  spaces, adding zeros if needed.**

If the exponent is positive, move the decimal point  $n$  places to the right.

If the exponent is negative, move the decimal point  $|n|$  places to the left.

Exponent is positive so we move the decimal 3 spaces to the right, adding 2 zeros as placeholders.

$$6.\overset{\text{red}}{\rightarrow}2_10_20_3 = 6,200.$$

**Step 3: Check to see if your answer makes sense.**

$10^3$  is 1000 and 1000 times 6.2 is 6,200.

**Try It**

11) Convert to decimal form:  $1.3 \times 10^3$

**Solution**

1,300

12) Convert to decimal form:  $9.25 \times 10^4$

**Solution**

92,500

13) Convert to decimal form:  $3.900 \times 10^5$

**Solution**

390,000

## HOW TO

### Convert scientific notation to decimal form.

The steps are summarized below.

To convert scientific notation to decimal form:

1. Determine the exponent,  $n$ , on the factor 10.
2. Move the decimal  $n$  places, adding zeros if needed.
  - If the exponent is positive, move the decimal point  $n$  places to the right.
  - If the exponent is negative, move the decimal point  $|n|$  places to the left.
3. Check.

### Example 2.3.5

Convert to decimal form:  $8.9 \times 10^{-2}$

#### Solution

**Step 1: Determine the exponent,  $n$ , on the factor 10.**

The exponent is  $-2$ .

**Step 2: Since the exponent is negative, move the decimal point 2 places to the left.**

$$8.9 \times 10^{-2} = 0.089$$

**Step 3: Add zeros as needed for placeholders.**

$$8.9 \times 10^{-2} = 0.089$$

**Try It**

14) Convert to decimal form:  $1.2 \times 10^{-4}$

**Solution**

0.00012

15) Convert to decimal form:  $7.5 \times 10^{-2}$

**Solution**

0.075

## Multiply and Divide Using Scientific Notation

Astronomers use very large numbers to describe distances in the universe and ages of stars and planets. Chemists use very small numbers to describe the size of an atom or the charge on an electron. When scientists perform calculations with very large or very small numbers, they use scientific notation. Scientific notation provides a way for the calculations to be done without writing a lot of zeros. We will see how the Properties of Exponents are used to multiply and divide numbers in scientific notation.

### Example 2.3.6

Multiply. Write answers in decimal form:  $(4 \times 10^5)(2 \times 10^{-7})$

**Solution**

**Step 1: Use the Commutative Property to rearrange the factors.**

$$4 \times 2 \times 10^5 \times 10^{-7}$$

**Step 2: Multiply.**

$$8 \times 10^{-2}$$

**Step 3:** Change to decimal form by moving the decimal two places left.

0.08

## Try It

16) Multiply  $(3 \times 10^6)(2 \times 10^{-8})$ . Write answers in decimal form.

**Solution**

0.06

17) Multiply  $(3 \times 10^{-2})(3 \times 10^{-1})$ . Write answers in decimal form.

**Solution**

0.009

## Example 2.3.7

Divide. Write answers in decimal form:  $\frac{9 \times 10^3}{3 \times 10^{-2}}$

**Solution**

**Step 1:** Separate the factors, rewriting as the product of two fractions.

$$\frac{9 \times 10^3}{3 \times 10^{-2}}$$

**Step 2:** Divide.

$$3 \times 10^5$$

**Step 3: Change to decimal form by moving the decimal five places right.**

300,000

## Try It

18) Divide  $\frac{8 \times 10^4}{2 \times 10^{-1}}$ . Write answers in decimal form.

**Solution**

400,000

19) Divide  $\frac{8 \times 10^2}{4 \times 10^{-2}}$ . Write answers in decimal form.

**Solution**

20,000

Access these online resources for additional instruction and practice with integer exponents and scientific notation:

- [Negative Exponents](#)
- [Scientific Notation](#)
- [Scientific Notation 2](#)

## Key Concepts

- **To convert a decimal to scientific notation:**

1. Move the decimal point so that the first factor is greater than or equal to 1 but less than 10.
2. Count the number of decimal places,  $n$ , that the decimal point was moved.
3. Write the number as a product with a power of 10. If the original number is:
  - greater than 1, the power of 10 will be  $10^n$
  - between 0 and 1, the power of 10 will be  $10^{-n}$
4. Check.

- **To convert scientific notation to decimal form:**

1. Determine the exponent,  $n$ , on the factor 10.
  2. Move the decimal  $n$  places, adding zeros if needed.
    - If the exponent is positive, move the decimal point  $n$  places to the right.
    - If the exponent is negative, move the decimal point  $|n|$  places to the left.
  3. Check.
- Use a tilde to indicate a significant zero when necessary.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=4449#h5p-35>

Overall, after looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

## Glossary

### scientific notation

A number is expressed in scientific notation when it is of the form  $M \times 10^n$  where  $1 \leq M < 10$  and  $n$  is an integer.

## 2.4 MORE UNIT CONVERSIONS AND ROUNDING RULES

### Learning Objectives

By the end of this section, you will be able to:

- Perform unit conversions while respecting the appropriate rounding rules for accuracy and precision.
- Perform operations with scientific notation while respecting the appropriate rounding rules for accuracy and precision.

Consider a simple example: how many feet are there in 4 yards? Most people will almost automatically answer that there are 12 feet in 4 yards. How did you make this determination? Well, if there are 3 feet in 1 yard and there are 4 yards, then there are  $4 \times 3 = 12$  feet in 4 yards.

This is correct, of course, but it is informal. Let us formalize it in a way that can be applied more generally. We know that 1 yard (yd) equals 3 feet (ft):

$$1 \text{ yd} = 3 \text{ ft}$$

In math, this expression is called an *equality*. The rules of algebra say that you can change (i.e., multiply or divide or add or subtract) the equality (as long as you don't divide by zero) and the new expression will still be an equality. For example, if we divide both sides by 2, we get

$$\frac{1}{2} \text{ yd} = \frac{3}{2} \text{ ft}$$

We see that one-half of a yard equals 3/2, or one and a half, feet—something we also know to be true, so the above equation is still an equality. Going back to the original equality, suppose we divide both sides of the equation by 1 yard (number *and* unit):

$$\frac{1 \text{ yd}}{1 \text{ yd}} = \frac{3 \text{ ft}}{1 \text{ yd}}$$

The expression is still an equality, by the rules of algebra. The left fraction equals 1. It has the same quantity in the numerator and the denominator, so it must equal 1. The quantities in the numerator and denominator cancel, both the number *and* the unit:

$$\frac{\cancel{1} \cancel{yd}}{\cancel{1} \cancel{yd}} = \frac{3ft}{1yd}$$

When everything cancels in a fraction, the fraction reduces to 1:

$$1 = \frac{3ft}{1yd}$$

We have an expression, 3 ft 1 yd, that equals 1. This is a strange way to write 1, but it makes sense: 3 ft equal 1 yd, so the quantities in the numerator and denominator are the same quantity, just expressed with different units. The expression 3 ft 1 yd is called a *conversion factor*, and it is used to formally change the unit of a quantity into another unit. (The process of converting units in such a formal fashion is sometimes called *dimensional analysis* or the *factor label method*.)

To see how this happens, let us start with the original quantity:

$$4 \text{ yd}$$

Now let us multiply this quantity by 1. When you multiply anything by 1, you don't change the value of the quantity. Rather than multiplying by just 1, let us write 1 as 3 ft 1 yd:

$$4yd \times \frac{3ft}{1yd}$$

The 4 yd term can be thought of as  $\frac{4yd}{1}$ ; that is, it can be thought of as a fraction with 1 in the denominator. We are essentially multiplying fractions. If the same thing appears in the numerator and denominator of a fraction, they cancel. In this case, what cancels is the unit *yard*:

$$\begin{aligned} & 4 \cancel{yd} \times \frac{3ft}{1 \cancel{yd}} \\ & \frac{4 \times 3ft}{1} = \frac{12ft}{1} = 12ft \end{aligned}$$

That is all that we can cancel. Now, multiply and divide all the numbers to get the final answer:

Again, we get an answer of 12 ft, just as we did originally. But in this case, we used a more formal procedure that is applicable to a variety of problems.

How many millimeters are in 14.66 m? To answer this, we need to construct a conversion factor between millimeters and meters and apply it correctly to the original quantity. We start with the definition of a millimeter, which is

$$1mm = \frac{1}{1,000m}$$

The 1/1,000 is what the prefix *milli-* means. Most people are more comfortable working without fractions, so we will rewrite this equation by bringing the 1,000 into the numerator of the other side of the equation:

$$1,000 \text{ mm} = 1 \text{ m}$$

Now we construct a conversion factor by dividing one quantity into both sides. But now a question arises: which quantity do we divide by? It turns out that we have two choices, and the two choices will give us different conversion factors, both of which equal 1:

$$\frac{1000\text{mm}}{1000\text{mm}} = \frac{1\text{m}}{1000\text{mm}} \text{ or } \frac{1000\text{mm}}{1\text{m}} = \frac{1\text{m}}{1\text{m}}$$

$$1 = \frac{1\text{m}}{1000\text{mm}} \text{ or } \frac{1000\text{mm}}{1\text{m}} = 1$$

Which conversion factor do we use? The answer is based on *what unit you want to get rid of in your initial quantity*. The original unit of our quantity is meters, which we want to convert to millimeters. Because the original unit is assumed to be in the numerator, to get rid of it, we want the meter unit in the *denominator*; then they will cancel. Therefore, we will use the second conversion factor. Cancelling units and performing the mathematics, we get

$$14.66 \cancel{\text{m}} \times \frac{1000\text{mm}}{1\cancel{\text{m}}} = 14660\text{mm}$$

Note how m cancels, leaving mm, which is the unit of interest.

The ability to construct and apply proper conversion factors is a very powerful mathematical technique in chemistry. You need to master this technique if you are going to be successful in this and future courses.

### Example 2.4.1

- a. Convert 35.9 kL to liters.
- b. Convert 555 nm to meters.

#### Solution

a.

**Step 1: We will use the fact that  $1\text{kL} = 1,000\text{L}$ .**

Of the two conversion factors that can be defined, the one that will work is  $\frac{1,000\text{L}}{1\text{kL}}$ .

**Step 2: Applying this conversion factor, we get:**

$$35.9 \cancel{\text{kL}} \times \frac{1000\text{L}}{1\cancel{\text{kL}}} = 35900\text{L}$$

b.

**Step 1:** We will use the fact that  $1\text{nm} = \frac{1}{1,000,000,000\text{m}}$ , which we will rewrite as

**1,000,000,000 nm = 1 m, or 10 nm = 1 m.**

**Step 2:** Of the two possible conversion factors, the appropriate one has the nm unit in the denominator.

$$\frac{1\text{m}}{10^9\text{nm}}$$

**Step 3:** Applying this conversion factor, we get:

$$555\text{nm} \times \frac{1\text{m}}{10^9\text{nm}} = 0.000000555\text{m}$$

**Step 4:** In the final step, we expressed the answer in scientific notation.

$$= 5.55 \times 10^{-7}\text{m}$$

## Try It

- 1) Convert  $67.08\mu\text{L}$  to liters. Give your answer in scientific notation.
- 2) Convert  $56.8\text{m}$  to kilometers. Give your answer in scientific notation.

### Solution

1.  $6.708 \times 10^{-5}\text{L}$
2.  $5.68 \times 10^{-2}\text{km}$

What if we have a derived unit that is the product of more than one unit, such as  $\text{m}^2$ ? Suppose we want to convert square meters to square centimeters? The key is to remember that  $\text{m}^2$  means  $\text{m} \times \text{m}$ , which means we

have *two* meter units in our derived unit. That means we have to include *two* conversion factors, one for each unit. For example, to convert  $17.6 \text{ m}^2$  to square centimeters, we perform the conversion as follows:

$$17.6 \text{ m}^2 = 17.6 (\cancel{\text{m}} \times \cancel{\text{m}}) \times \frac{100 \text{ cm}}{1 \cancel{\text{m}}} \times \frac{100 \text{ cm}}{1 \cancel{\text{m}}} = 17000 \text{ cm} \times \text{cm} = 1.76 \times 10^5 \text{ cm}^2$$

### Example 2.4.2

How many cubic centimeters are in  $0.883 \text{ m}^3$ ?

#### Solution

With an exponent of 3, we have three length units, so by extension we need to use three conversion factors between meters and centimeters. Thus, we have

$$0.833 \cancel{\text{m}^3} \times \frac{100 \text{ cm}}{1 \cancel{\text{m}}} \times \frac{100 \text{ cm}}{1 \cancel{\text{m}}} \times \frac{100 \text{ cm}}{1 \cancel{\text{m}}} = 883000 \text{ cm}^3 = 8.83 \times 10^5 \text{ cm}^3$$

You should demonstrate to yourself that the three meter units do indeed cancel.

### Try It

3) How many cubic millimeters are present in  $0.0923 \text{ m}^3$ ? Give your answer in scientific notation.

#### Solution

$$9.23 \times 10^7 \text{ mm}^3$$

Suppose the unit you want to convert is in the denominator of a derived unit; what then? Then, in the conversion factor, the unit you want to remove must be in the *numerator*. This will cancel with the original unit in the denominator and introduce a new unit in the denominator. The following example illustrates this situation.

### Example 2.4.3

Convert 88.4 m/min to meters/second.

#### Solution

**Step 1: We want to change the unit in the denominator from minutes to seconds.**

Because there are 60 seconds in 1 minute ( $60\text{ s} = 1\text{ min}$ ), we construct a conversion factor so that the unit we want to remove, minutes, is in the numerator:  $1\text{ min}/60\text{ s}$ .

**Step 2: Apply and perform the math.**

$$\frac{88.4\text{ m}}{\text{min}} \times \frac{1\text{ min}}{60\text{ s}} = 1.47\text{ m/s}$$

Notice how the 88.4 automatically goes in the numerator. That's because any number can be thought of as being in the numerator of a fraction divided by 1.

Figure 2.4.1. How Fast Is Fast? A common garden snail moves at a rate of about 0.2 m/min, which is about 0.003 m/s, which is 3 mm/s!

Source: "Grapevine snail" by Jürgen Schoneris licensed under the Creative Commons Attribution-Share Alike 3.0 Unported license.

## Try It

4) Convert 0.203 m/min to meters/second. Give your answer in scientific notation.

### Solution

0.00338 m/s or  $3.38 \times 10^{-3}$  m/s

Sometimes there will be a need to convert from one unit with one numerical prefix to another unit with a different numerical prefix. How do we handle those conversions? Well, you could memorize the conversion factors that interrelate all numerical prefixes. Or you can go the easier route: first convert the quantity to the base unit, the unit with no numerical prefix, using the definition of the original prefix. Then convert the quantity in the base unit to the desired unit using the definition of the second prefix. You can do the conversion in two separate steps or as one long algebraic step. For example, to convert 2.77 kg to milligrams:

$$2.77 \cancel{\text{kg}} \times \frac{1000g}{1 \cancel{\text{kg}}} = 2770g \text{ (convert to the base unit of grams)}$$

$$2770 \cancel{g} \times \frac{1000mg}{1 \cancel{g}} = 2770000mg = 2.77 \times 10^6 mg \text{ (convert to the desired unit)}$$

Alternatively, it can be done in a single multistep process:

$$2.77 \cancel{\text{kg}} \times \frac{1000 \cancel{g}}{1 \cancel{\text{kg}}} \times \frac{1000mg}{1 \cancel{g}} = 2770000m = 2.77 \times 10^6 mg$$

You get the same answer either way.

### Example 2.4.4

How many nanoseconds are in 368.09  $\mu\text{s}$ ?

#### Solution

You can either do this as a one-step conversion from microseconds to nanoseconds or convert to the base unit first and then to the final desired unit. We will use the second method here, showing the two steps in a single line. Using the definitions of the prefixes *micro-* and *nano-*,

$$368.09 \cancel{\mu\text{s}} \times \frac{1 \cancel{\text{s}}}{10^6 \cancel{\mu\text{s}}} \times \frac{10^9 \text{ns}}{1 \cancel{\text{s}}} = 368090 \text{ns} = 3.6809 \times 10^5 \text{ns}$$

### Try It

5) How many milliliters are in 607.8 kL? Give your answer in scientific notation.

#### Solution

$$6.078 \times 10^8 \text{ mL}$$

When considering the significant figures of a final numerical answer in a conversion, there is one important case where a number does not impact the number of significant figures in a final answer—the so-called exact number. An exact number is a number from a defined relationship, not a measured one. For example, the prefix *kilo-* means 1,000—*exactly* 1,000, no more or no less. Thus, in constructing the conversion factor

$$\frac{1000\text{g}}{1\text{kg}}$$

neither the 1,000 nor the 1 enter into our consideration of significant figures. The numbers in the numerator and denominator are defined exactly by what the prefix *kilo-* means. Another way of thinking about it is that these numbers can be thought of as having an infinite number of significant figures, such as

$$\frac{1000.0000000000...g}{1.0000000000...kg}$$

The other numbers in the calculation will determine the number of significant figures in the final answer.

### Example 2.4.5

A rectangular plot in a garden has the dimensions 36.7 cm by 128.8 cm. What is the area of the garden plot in square meters? Express your answer in the proper number of significant figures.

#### Solution

Area is defined as the product of the two dimensions, which we then have to convert to square meters and express our final answer to the correct number of significant figures, which in this case will be three.

$$36.7 \cancel{\text{cm}} \times 128.8 \cancel{\text{cm}} \times \frac{1\text{m}}{100 \cancel{\text{cm}}} \times \frac{1\text{m}}{100 \cancel{\text{cm}}} = 0.472696\text{m}^2 = 0.473\text{m}^2$$

The 1 and 100 in the conversion factors do not affect the determination of significant figures because they are exact numbers, defined by the centi- prefix.

### Try It

6) What is the volume of a block in cubic meters whose dimensions are 2.1 cm × 34.0 cm × 118 cm?

#### Solution

$$0.0084 \text{ m}^3$$

In the examples above, the answers provided are all consistent with the rounding rules from the previous section, but we did not emphasize what choices were being made while reporting our answers. In the next

sections, we will go through a series of examples to combine what we've learned over the last few sections. Throughout this section (and for the rest of the course), be sure to always pay attention to the instructions so that you are always rounding appropriately. Sometimes, you will be required to follow the rounding rules for accuracy and precision, and other times, you will be asked to round to a specific place value. It is always important to pay attention to detail and to answer questions with care.

## Rounding Rules When Converting Within the Same System of Measurement

When considering metric-to-metric or U.S. System-to-U.S. System conversions, we must first realize that our conversion equations within each system are exact. For example,  $100\text{cm} = 1\text{m}$  means that there are exactly 100 centimeters in 1 meter and  $1\text{ft} = 12\text{in}$  means that there are exactly 12 inches in 1 foot. Since these conversion equations are exact, this means that the numbers involved have infinitely many significant figures and infinitely many decimal places. As such, when we are performing metric-to-metric or U.S. System-to-U.S. System conversions, we will use the measurement that we are converting to determine the appropriate number of significant figures to include in our answer. Please note that metric-to-metric conversion equations must be recreated by memory, whereas units from the U.S. system will always be provided in our course.

### Example 2.4.6

Convert 31.5 meters per minute to meters per second. Give your answer with the appropriate number of significant figures.

#### **Solution**

**Step 1: Write down any relevant unit conversion equations.**

$$1\text{min} = 60\text{s}$$

**Step 2: Convert the units using dimensional analysis.**

$$\begin{aligned}
 &= \frac{31.5m}{1min} \times \frac{1min}{60s} \\
 &= \frac{31.5m}{60s} \\
 &= 0.525 \text{ m/s}
 \end{aligned}$$

**Step 3: Be sure that the answer is given to the proper number of significant figures.**

Since the operations we performed were all multiplications and divisions, we need to round to the least number of significant figures. The unit conversion equation used,  $1min = 60s$ , is exact so there are infinitely many significant figures in those values. In this case, we need to look at the measurement given. Since  $31.5m/min$  has 3 significant figures, our answer should have 3 significant figures as well. So our answer of  $0.525m/s$  is appropriate.

### Example 2.4.7

Convert  $180\tilde{m}g/dL$  to g/L. Give your answer with the appropriate number of significant figures.

#### Solution

**Step 1: Write down any relevant unit conversion equations.**

$$1000mg = 1g \text{ and } 10dL = 1L$$

For the purpose of the work, we will make note that there is a tilde over the zero and so  $180\tilde{}$  has 3 significant figures.

**Step 2: Convert the units using dimensional analysis.**

$$\begin{aligned}
 &= \frac{180mg}{1dL} \times \frac{10dL}{1L} \times \frac{1g}{1000mg} \\
 &= \frac{180 \times 10g}{1 \text{ times } 1000L} \\
 &= 1.8 \text{ g/L}
 \end{aligned}$$

**Step 3: Be sure that the answer is given to the proper number of significant figures.**

The operations we used in this question were multiplications and divisions, and so we need to round to the least number of significant figures in our values. Our calculator gives us  $1.8g/L$ , but we need to take into account the fact that our measurement had 3 significant figures. Thus, our answer in this case should have 3 significant figures.

Our answer in this case is that  $180\tilde{m}g/dL = 1.80g/L$ .

**Example 2.4.8**

Convert 32.8 ounces to cups. Give your answer with the appropriate number of significant figures.

**Solutions**

The following unit conversion equations may be useful for this example:  $1cup = 8oz$ .

**Step 1: Write down any relevant unit conversion equations.**

Note, that the U.S. system conversion equation is given.

**Step 2: Convert the units using dimensional analysis.**

$$\begin{aligned} &= \frac{32.8oz}{1} \times \frac{1cup}{8oz} \\ &= \frac{32.8\ cup}{1 \cdot 8} \\ &= 4.1\ cups \end{aligned}$$

**Step 3: Be sure that the answer is given to the proper number of significant figures.**

The operations we used in this question were multiplications and divisions, and so we need to round to the least number of significant figures in our values. Our calculator does not take into account significant figures. Since our unit conversion equation is exact (i.e. there are exactly 8 ounces in 1 cup), those numbers have infinitely many significant figures. Thus, we need to look to our measurement to decide how many significant figures our answer needs. 32.8 ounces has 3 significant figures, so our answer must also have 3 significant figures.

Therefore,  $32.8\text{oz} = 4.10\text{cups}$ .

### Example 2.4.9

Convert 161.8 miles per hour to feet per second. Give your answer with the appropriate number of significant figures.

#### Solution

The following unit conversion equations may be useful for this example:  $1\text{mi} = 5280\text{ft}$ .

#### Step 1: Write down any relevant unit conversion equations.

Note, that the U.S. system conversion equation is given. To convert from hours to seconds, we need to know:  $1\text{h} = 3600\text{s}$ .

#### Step 2: Convert the units using dimensional analysis.

$$\begin{aligned} &= \frac{161.8\text{mi}}{1\text{h}} \times \frac{5280\text{ft}}{1\text{mi}} \times \frac{1\text{h}}{3600\text{s}} \\ &= \frac{161.8 \cdot 5280\text{ft}}{1 \cdot 3600\text{s}} \\ &= 237.30\overline{6}\text{ft/s} \end{aligned}$$

#### Step 3: Be sure that the answer is given to the proper number of significant figures.

The operations we used in this question were multiplications and divisions, and so we need to round to the least number of significant figures in our values. Our calculator does not take into account significant figures. Since our unit conversion equation is exact, the numbers involved in the conversion equations have infinitely many significant figures. Thus, we need to look to our measurement to decide how many significant figures our answer needs. 161.8 mi/h has 4 significant figures, so our answer must also have 4 significant figures.

Therefore,  $161.8\text{mi/h} = 237.2\text{ft/s}$ .

As we have seen in the examples above, when we are converting metric-to-metric or U.S. System-to-U.S. System units, we round according to the measurement that we are converting.

## Rounding Rules When Converting Between Two Different Systems of Measurement

When considering the unit conversion equations that establish relationships between two units of different measurement systems, it is important to note the number of significant figures present in the equations. This is due to the fact that when we convert from the metric system to the U.S. system of measurement, the relationships between the units are not exact, but are rather approximations. For example, if we wanted to convert between grams (metric) and pounds (U.S. system), we may be given one of the following unit conversion equations.

### Unit Conversion Equations for Converting Between Grams and Pounds

$$1.00lb = 454g$$

$$1.000lb = 453.6g$$

$$1.0000lb = 453.59g$$

$$1.00000lb = 453.592g$$

The equations above show that the precision of the unit conversion equation depends on the precision of the measurement tool that was used. Therefore, these numbers in these unit conversion equations are approximate and will be taken into account while performing our unit conversions.

### Example 2.4.10

Convert 8.4 miles to kilometers. Give your answer with the appropriate number of significant figures.

#### Solution

The following unit conversion equations may be useful for this example:

$$1.0000mi = 1.6093km.$$

#### Step 1: Write down any relevant unit conversion equations.

Note, that the U.S. system to metric conversion equation is provided.

#### Step 2: Convert the units using dimensional analysis.

$$\begin{aligned} &= \frac{8.4mi}{1} \times \frac{1.6093km}{1.0000mi} \\ &= \frac{8.4 \cdot 1.6093km}{1} \\ &= 13.51812km \end{aligned}$$

#### Step 3: Be sure that the answer is given to the proper number of significant figures.

All the operations in our conversion above were multiplications and divisions, so we need to round to the least number of significant figures. Don't forget, our calculator does not take into account significant figures. Since our unit conversion is  $1.0000\text{ mi} = 1.6093\text{ km}$ , each of those numbers has 5 significant figures, whereas our measurement of  $8.4\text{mi}$  has only 2 significant figures. Thus, we need to round our final answer to 2 significant figures.

$$\text{Therefore, } 8.4mi = 14km.$$

### Example 2.4.11

Convert 20.18 kilogram per liter to pound per gallon. Give your answer with the appropriate number of significant figures.

#### Solution

The following unit conversion equations may be useful for this example:  $1.00\text{kg} = 2.20\text{lbs}$  and  $1.00\text{L} = 0.264\text{gal}(U. S.)$ .

#### Step 1: Write down any relevant unit conversion equations.

Note, that the U.S. system to metric conversion equations are provided.

#### Step 2: Convert the units using dimensional analysis.

$$\begin{aligned} &= \frac{20.18\text{kg}}{1\text{L}} \times \frac{2.20\text{lbs}}{1.00\text{kg}} \frac{1.00\text{L}}{0.264\text{gal}} \\ &= \frac{20.18 \times 2.20 \times 1.00\text{lbs}}{1 \times 1.00 \times 0.264\text{gal}} \\ &= 168.1\overline{6}\text{lbs/gal} \end{aligned}$$

#### Step 3: Be sure that the answer is given to the proper number of significant figures.

All the operations in our conversion above were multiplications and divisions, so we need to round to the least number of significant figures. Don't forget, our calculator does not take into account significant figures. Since our unit conversions are  $1.00\text{kg} = 2.20\text{lbs}$  and  $1.00\text{L} = 0.264\text{U. S. gal}$ , each of those numbers have 3 significant figures, whereas our measurement of 20.18 kg/L has 4 significant figures. Thus, we need to round our final answer to 3 significant figures.

Therefore,  $20.18\text{kg/L} = 168\text{lbs/gal}$ .

## Rounding Rules With Scientific Notation

Now that we know how to use scientific notation, we can combine this with our knowledge of our rounding rules to round appropriately. In the following examples, we will perform the indicated operations and round according to the instructions provided.

### Example 2.4.12

Perform the indicated operations. Give your answer with the appropriate number of significant figures.

- a.  $3.92 \times 10^4 + 2.3 \times 10^4$
- b.  $1.9 \times 10^{-2} - 1.49 \times 10^{-1}$
- c.  $(5.8 \times 10^5) \times (2.84 \times 10^{-7})$
- d.  $\frac{(3.8 \times 10^2)(2.93 \times 10^3)}{(8 \times 10^{-3})(8.935 \times 10^3)}$

#### Solution

a.

**Step 1:** Since the powers of ten are the same, we can simply add the values.

$$3.92 \times 10^4 + 2.3 \times 10^4 = 6.22 \times 10^4$$

**Step 2:** As we were adding, we need to round to the correct precision. This means, we need to round according to the  $2.3 \times 10^4$  which has 2 significant figures.

Thus, the answer is:  $6.2 \times 10^4$

---

b.

**Step 1:** First, we need to write the numbers with the same power of ten.

$$\begin{aligned} &= 1.9 \times 10^{-2} - 1.49 \times 10^{-1} \\ &= 0.19 \times 10^{-1} - 1.49 \times 10^{-1} \\ &= -1.3 \times 10^{-1} \end{aligned}$$

**Step 2:** Our answer already has the correct precision, so no further rounding is necessary.

---

c.

**Step 1:** To multiply scientific notation, multiply the coefficients and add the exponents on the tens.

$$\begin{aligned}
 &= (5.8 \times 10^5) \times (2.84 \times 10^{-7}) 10^{-1} \\
 &= (5.8 \cdot 2.84) \times 10^{5+(-7)} \\
 &= 16.472 \times 10^{-2}
 \end{aligned}$$

**Step 2:** Before we round, we need to write this number in correct scientific notation.

$$= 1.6472 \times 10^{-1}$$

**Step 3:** Now, since we multiplied to get this result, we need to round to the least number of significant figures, which in this case is 2.

$$= 1.6 \times 10^{-1}$$

---

d.

**Step 1:** To answer this question, let's first perform the multiplications in the numerator and denominator, and then we will do the division.

$$\begin{aligned}
 &\frac{(3.8 \times 10^2)(2.93 \times 10^3)}{(8 \times 10^{-3})(8.935 \times 10^3)} \\
 &= \frac{3.8 \times 2.93 \times 10^{2+3}}{8 \times 8.935 \times 10^{-3+3}} \\
 &= \frac{11.134 \times 10^5}{71.48 \times 10^0}
 \end{aligned}$$

**Step 2:** Now, we can perform the division of the coefficients and subtract the exponents on the tens.

$$= 0.15576385 \times 10^5$$

**Step 3:** Finally, let's put this into correct scientific notation before we round appropriately.

$$= 1.5576385 \times 10^4$$

**Step 4:** Since the 8 in the initial problem only has 1 significant figure, our answer should only have 1 significant figure.

$$= 2 \times 10^4$$

### Important Note

Instructions on rounding expectations will always be given on evaluations. Be sure to read instructions carefully to know if you are expected to use the rounding rules covered in this section, or if there are any other expectations. If questions are vague and do not specify rounding instructions, do not round your answer.

### Key Concepts

- Units can be converted to other units using the proper conversion factors.
- Conversion factors are constructed from equalities that relate two different units.
- Conversions can be a single step or multistep.
- Unit conversion is a powerful mathematical technique in chemistry, physics, and mathematics, that must be mastered.
- Exact numbers do not affect the determination of significant figures.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=6819#h5p-43>

Overall, after looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

## 3.0 INTRODUCTION

---

If we carefully placed more rocks of equal weight on both sides of this formation, it would still balance. Similarly, the expressions in an equation remain balanced when we add the same quantity to both sides of the equation. In this chapter, we will solve equations, remembering that what we do to one side of the equation, we must also do to the other side.

Figure 3.0.1 : The rocks in this formation must remain perfectly balanced around the center for the formation to hold its shape [Photo by Robert Anasch Unsplash License](#)

Mathematical formulas model phenomena in every facet of our lives. They are used to explain events and predict outcomes in fields such as transportation, business, economics, medicine, chemistry, engineering, and many more. In this chapter, we will apply our skills in solving equations to solve problems in a variety of situations.

Figure 3.0.2 :Sophisticated mathematical models are used to predict traffic patterns on our nation's highways. [Photo by Derek Lee](#) [Unsplash License](#)

Graphs are found in all areas of our lives—from commercials showing you which cell phone carrier provides the best coverage, to bank statements and news articles, to the boardroom of major corporations. In this chapter, we will study the rectangular coordinate system, which is the basis for most consumer graphs. We will look at linear graphs, slopes of lines, equations of lines, and linear inequalities.

Figure 3.0.3: This graph illustrates the annual vehicle sales of gas motorcycles, gas cars, and electric vehicles from 1994 to 2010. It is a line graph with x- and y-axes, one of the most common types of graphs. [Image by Steve Jurvetson CC-BY-2.0](#)

## 3.1 SOLVE EQUATIONS USING THE SUBTRACTION AND ADDITION PROPERTIES OF EQUALITY

---

### Learning Objectives

By the end of this section, you will be able to:

- Verify a solution of an equation
- Solve equations using the Subtraction and Addition Properties of Equality
- Solve equations that require simplification
- Translate to an equation and solve
- Translate and solve applications

### Try It

Before you get started, take this readiness quiz:

- 1) Evaluate  $x + 4$  when  $x = -3$ .
- 2) Evaluate  $15 - y$  when  $y = -5$ .
- 3) Simplify  $4(4n + 1) - 15n$ .
- 4) Translate into algebra “5 is less than  $x$ ”.

## Verify a Solution of an Equation

Solving an equation is like discovering the answer to a puzzle. The purpose in solving an equation is to find the value or values of the variable that make each side of the equation the same – so that we end up with a true statement. Any value of the variable that makes the equation true is called a solution to the equation. It is the answer to the puzzle!

### Solution of an equation

A **solution of an equation** is a value of a variable that makes a true statement when substituted into the equation.

#### HOW TO

To determine whether a number is a solution to an equation.

1. Substitute the number in for the variable in the equation.
2. Simplify the expressions on both sides of the equation.
3. Determine whether the resulting equation is true (the left side is equal to the right side)
  - If it is true, the number is a solution.
  - If it is not true, the number is not a solution.

#### Example 3.1.1

Determine whether  $x = \frac{3}{2}$  is a solution of  $4x - 2 = 2x + 1$ .

**Solution**

Since a solution to an equation is a value of the variable that makes the equation true, begin by substituting the value of the solution for the variable.

**Step 1: Substitute  $\frac{3}{2}$  for  $x$ .**

$$4\left(\frac{3}{2}\right) - 2 \stackrel{?}{=} 2\left(\frac{3}{2}\right) + 1$$

**Step 2: Multiply.**

$$6 - 2 \stackrel{?}{=} 3 + 1$$

**Step 3: Subtract.**

$$4 = 4\checkmark$$

Since  $x = \frac{3}{2}$  results in a true equation (4 is in fact equal to 4),  $\frac{3}{2}$  is a solution to the equation  $4x - 2 = 2x + 1$

## Try It

5) Is  $y = \frac{4}{3}$  a solution of  $9y + 2 = 6y + 3$ ?

**Solution**

no

6) Is  $y = \frac{7}{5}$  a solution of  $5y + 3 = 10y - 4$ ?

**Solution**

yes

## Solve Equations Using the Subtraction and Addition

## Properties of Equality

We are going to use a model to clarify the process of solving an equation. An envelope represents the variable – since its contents are unknown – and each counter represents one. We will set out one envelope and some counters on our workspace, as shown in Figure 3.1.1. Both sides of the workspace have the same number of counters, but some counters are “hidden” in the envelope. Can you tell how many counters are in the envelope?

The illustration shows a model of an equation with one variable. On the left side of the workspace is an unknown (envelope) and three counters, while on the right side of the workspace are eight counters.

Figure 3.1.1 The illustration shows a model of an equation with one variable. On the left side of the workspace is an unknown (envelope) and three counters, while on the right side of the workspace are eight counters.

What are you thinking? What steps are you taking in your mind to figure out how many counters are in the envelope?

Perhaps you are thinking: “I need to remove the 3 counters at the bottom left to get the envelope by itself. The 3 counters on the left can be matched with 3 on the right and so I can take them away from both sides. That leaves five on the right—so there must be 5 counters in the envelope.” See Figure 3.1.2. for an illustration of this process.

The illustration shows a model for solving an equation with one variable. On both sides of the workspace remove three counters, leaving only the unknown (envelope) and five counters on the right side. The unknown is equal to five counters.

Figure 3.1.2-The illustration shows a model for solving an equation with one variable. On both sides of the workspace remove three counters, leaving only the unknown (envelope) and five counters on the right side. The unknown is equal to five counters.

What algebraic equation would match this situation? In Figure 3.1.3 each side of the workspace represents an expression and the centre line takes the place of the equal sign. We will call the contents of the envelope  $x$ .

The illustration shows a model for the equation  $x + 3 = 8$ .

3.1.3 – The illustration shows a model for the equation  $x + 3 = 8$ .

Let's write algebraically the steps we took to discover how many counters were in the envelope:

---

$$x + 3 = 8$$

First, we took away three from each side.  $x + 3 - 3 = 8 - 3$

Then we were left with five.  $x = 5$

Check: Five in the envelope plus three more does equal eight!

$$5 + 3 = 8$$

---

Our model has given us an idea of what we need to do to solve one kind of equation. The goal is to isolate the variable by itself on one side of the equation. To solve equations such as these mathematically, we use the *Subtraction Property of Equality*.

### Subtraction Property of Equality

For any numbers  $a$ ,  $b$ , and  $c$ ,

if  $a = b$ ,

then  $a - c = b - c$

When you subtract the same quantity from both sides of an equation, you still have equality.

Let's see how to use this property to solve an equation. Remember, the goal is to isolate the variable on one side of the equation. And we check our solutions by substituting the value into the equation to make sure we have a true statement.

### Example 3.1.2

Solve:  $y + 37 = -13$ .

#### Solution

To get  $y$  by itself, we will undo the addition of 37 by using the Subtraction Property of Equality.

**Step 1: Subtract 37 from each side to ‘undo’ the addition.**

$$y + 37 - 37 = -13 - 37$$

**Step 2: Simplify.**

$$y = -50$$

**Step 3: Check:**

$$y + 37 = -13$$

**Step 4: Substitute  $y = -50$**

$$\begin{aligned} -50 + 37 &= -13 \\ -13 &\stackrel{?}{=} -13 \checkmark \end{aligned}$$

Since  $y = -50$  makes  $y + 37 = -13$  a true statement, we have the solution to this equation.

## Try It

7) Solve:  $x + 19 = -27$ .

**Solution**

$$x = -46$$

8) Solve:  $x + 16 = -34$ .

**Solution**

$$x = -50$$

What happens when an equation has a number subtracted from the variable, as in the equation  $x - 5 = 8$ ? We use another property of equations to solve equations where a number is subtracted from the variable. We want to isolate the variable, so to ‘undo’ the subtraction we will add the number to both sides. We use the Addition Property of Equality.

## Addition Property of Equality

For any numbers  $a$ ,  $b$ , and  $c$ ,

if  $a = b$ ,

then  $a + c = b + c$

When you add the same quantity to both sides of an equation, you still have equality.

In Example 3.1.2, 37 was added to the  $y$  and so we subtracted 37 to ‘undo’ the addition. In 3.1.3, we will need to ‘undo’ subtraction by using the Addition Property of Equality.

### Example 3.1.3

Solve:  $a - 28 = -37$ .

**Solution**

**Step 1:** Add 28 to each side to ‘undo’ the subtraction.

$$a - 28 + 28 = -37 + 28$$

**Step 2:** Simplify.

$$a = -9$$

**Step 3:** Check:

$$a - 28 = -37$$

**Step 4:** Substitute  $a = -9$

$$\begin{aligned} -9 - 28 &= -37 \\ -37 &\stackrel{?}{=} -37 \checkmark \end{aligned}$$

The solution to  $a - 28 = -37$  is  $a = -9$ .

## Try It

9) Solve:  $n - 61 = -75$ .

**Solution**

$$n = -14$$

10) Solve:  $p - 41 = -73$ .

**Solution**

$$p = -32$$

## Example 3.1.4

Solve:  $x - \frac{5}{8} = \frac{3}{4}$

**Solution**

**Step 1:** Use the Addition Property of Equality.

$$x - \frac{5}{8} + \frac{5}{8} = \frac{3}{4} + \frac{5}{8}$$

**Step 2:** Find the LCD to add the fractions on the right.

$$x - \frac{5}{8} + \frac{5}{8} = \frac{6}{8} + \frac{5}{8}$$

Simplify

$$x = \frac{11}{8}$$

**Step 3:** Check:

$$x - \frac{5}{8} = \frac{3}{4}$$

**Step 4: Substitute**  $x = \frac{11}{8}$ .

Subtract.

Simplify.

The solution to  $x - \frac{5}{8} = \frac{3}{4}$  is  $x = \frac{11}{8}$

$$\begin{array}{r} \frac{11}{8} - \frac{5}{8} = \frac{3}{4} \\ \frac{6}{8} = \frac{3}{4} \\ \frac{3}{4} = \frac{3}{4} \checkmark \end{array}$$

## Try It

11) Solve:  $p - \frac{2}{3} = \frac{5}{6}$

**Solution**

$$p = \frac{3}{2}$$

12) Solve:  $q - \frac{1}{2} = \frac{5}{6}$

**Solution**

$$q = \frac{4}{3}$$

The next example will be an equation with decimals.

### Example 3.1.5

Solve:  $n - 0.63 = -4.2$ .

**Solution**

**Step 1: Use the Addition Property of Equality.**

$$\begin{array}{rcl} n - 0.63 + 0.63 & = & -4.2 + 0.63 \\ \text{Add.} & & n = -3.57 \end{array}$$

**Step 2: Check:**

$$n = -3.57$$

**Step 3: Let  $n = -3.57$ .**

$$\begin{array}{rcl} -3.57 - 0.63 & \stackrel{?}{=} & -4.2 \\ -4.2 & = & -4.2 \checkmark \end{array}$$

### Try It

13) Solve:  $b - 0.47 = -2.1$ .

**Solution**

$$b = -1.63$$

14) Solve:  $c - 0.93 = -4.6$ .

**Solution**

$$c = -3.67$$

## Solve Equations That Require Simplification

In the previous examples, we were able to isolate the variable with just one operation. Most of the equations we encounter in algebra will take more steps to solve. Usually, we will need to simplify one or both sides of an equation before using the *Subtraction or Addition Properties of Equality*.

You should always simplify as much as possible before you try to isolate the variable. Remember that to simplify an expression means to do all the operations in the expression. Simplify one side of the equation at a time. Note that simplification is different from the process used to solve an equation in which we apply an operation to both sides.

### Example 3.1.6

Solve:  $9x - 5 - 8x - 6 = 7$ .

#### Solution

**Step 1: Simplify the expressions on each side as much as possible.**

Rearrange the terms, using the Commutative Property of Addition.

$$\begin{aligned} \text{Combine like terms.} \quad & 9x - 5 - 8x - 6 = 7 \\ & 9x - 8x - 5 - 6 = 7 \\ & x - 11 = 7 \end{aligned}$$

Notice that each side is now simplified as much as possible.

**Step 2: Isolate the variable.**

Now isolate  $x$ .

Undo subtraction by adding 11 to both sides.  $x - 11 + 11 = 7 + 11$

**Step 3: Simplify the expressions on both sides of the equation.**

$$x = 18$$

**Step 4: Check the solution.**

Substitute  $x = 18$

$$\begin{aligned}
 9x - 5 - 8x - 6 &= 7 \\
 9(18) - 5 - 8(8) - 6 &\stackrel{?}{=} 7 \\
 162 - 5 - 144 - 6 &\stackrel{?}{=} 7 \\
 157 - 144 &\stackrel{?}{=} 7 \\
 13 - 6 &\stackrel{?}{=} 7 \\
 7 &= 7 \checkmark
 \end{aligned}$$

The solution to  $9x - 5 - 8x - 6 = 7$  is  $x = 18$

## Try It

15) Solve:  $8y - 4 - 7y - 7 = 4$ .

**Solution**

$$y = 15$$

16) Solve:  $6z + 5 - 5z - 4 = 3$ .

**Solution**

$$z = 2$$

## Example 3.1.7

Solve:  $5(n - 4) - 4n = -8$ .

**Solution**

We simplify both sides of the equation as much as possible before we try to isolate the variable.

**Step 1: Distribute on the left.**

$$5n - 20 - 4n = -8$$

**Step 2: Use the Commutative Property to rearrange terms.**

$$5n - 4n - 20 = -8$$

$$\text{Combine like terms.} \quad n - 20 = -8$$

**Step 3: Each side is as simplified as possible. Next, isolate  $n$ .**

**Step 4: Undo subtraction by using the Addition Property of Equality.**

$$n - 20 + 20 = -8 + 20$$

$$\text{Add.} \quad n = 12$$

**Step 5: Check.**

Substitute  $n = 12$ .

$$5(n - 4) - 4n = -8$$

$$5(12 - 4) - 4(12) \stackrel{?}{=} -8$$

$$5(8) - 48 \stackrel{?}{=} -8$$

$$40 - 48 \stackrel{?}{=} -8$$

$$-8 = -8 \checkmark$$

The solution to  $5(n - 4) - 4n = -8$  is  $n = 12$ .

## Try It

17) Solve:  $5(p - 3) - 4p = -10$ .

**Solution**

$$p = 5$$

18) Solve:  $4(q + 2) - 3q = -8$ .

**Solution**

$$q = -16$$

### Example 3.1.8

Solve:  $3(2y - 1) - 5y = 2(y + 1) - 2(y + 3)$ .

**Solution**

We simplify both sides of the equation before we isolate the variable.

**Step 1: Distribute on both sides.**

$$6y - 3 - 5y = 2y + 2 - 2y - 6$$

**Step 2: Use the Commutative Property of Addition.**

$$6y - 5y - 3 = 2y - 2y + 2 - 6$$

Combine like terms.

$$y - 3 = -4$$

**Step 3: Each side is as simplified as possible. Next, isolate  $y$ .**

**Step 4: Undo subtraction by using the Addition Property of Equality.**

$$y - 3 + 3 = -4 + 3$$

Add.

$$y = -1$$

**Step 5: Check.**

Let  $y = -1$ .

$$\begin{aligned}
3(2y - 1) - 5y &= 2(y + 1) - 2(y + 3) \\
3(2(\textcolor{red}{-1}) - 1) - 5(\textcolor{red}{-1}) &\stackrel{?}{=} 2(-1 + 1) - 2(-1 + 3) \\
3(-2 - 1) + 5 &\stackrel{?}{=} 2(0) - 2(2) \\
3(-3) + 5 &\stackrel{?}{=} -4 \\
-9 + 5 &= -4 \\
-4 &= -4 \checkmark
\end{aligned}$$

The solution to  $3(2y - 1) - 5y = 2(y + 1) - 2(y + 3)$  is  $y = -1$ .

## Try It

19) Solve:  $4(2h - 3) - 7h = 6(h - 2) - 6(h - 1)$

**Solution**

$$h = 6$$

20) Solve:  $2(5x + 2) - 9x = 3(x - 2) - 3(x - 4)$

**Solution**

$$x = 2$$

## Translate to an Equation and Solve

To solve applications algebraically, we will begin by translating from English sentences into equations. Our first step is to look for the word (or words) that would translate to the equals sign. Below table shows us some of the words that are commonly used.

<b>Equals =</b>	is is equal to is the same as the result is gives was will be
-----------------	---

The steps we use to translate a sentence into an equation are listed below.

## HOW TO

### Translate an English sentence to an algebraic equation.

1. Locate the “equals” word(s). Translate to an equals sign (=).
2. Translate the words to the left of the “equals” word(s) into an algebraic expression.
3. Translate the words to the right of the “equals” word(s) into an algebraic expression.

### Example 3.1.9

Translate and solve: Eleven more than  $x$  is equal to 54.

#### **Solution**

**Step 1: Translate.**

$$\underbrace{\text{Eleven more than } x}_{x+11} \underbrace{\text{is equal to}}_{=} \underbrace{54}_{54}$$

**Step 2: Subtract 11 from both sides.**

$$x + 11 - 11 = 54 - 11$$

**Step 3: Simplify.**

$$x = 43$$

**Step 4: Check**

$$43 + 11 \stackrel{?}{=} 54$$

$$54 = 54$$

**Try It**

21) Translate and solve: Ten more than  $x$  is equal to 41.

**Solution**

$$x + 10 = 41; \quad x = 31$$

22) Translate and solve: Twelve less than  $x$  is equal to 51.

**Solution**

$$y - 12 = 51; \quad y = 63$$

**Example 3.1.10**

Translate and solve: The difference of  $12t$  and  $11t$  is  $-14$ .

**Solution****Step 1: Translate.**

$$\underbrace{\text{The difference of } 12t \text{ and } 11t}_{12t - 11t} \text{ is } \underbrace{-14}_{= -14}$$

**Step 2: Simplify.**

$$t = -14$$

**Step 3: Check:**

$$12(-14) - 11(-14) \stackrel{?}{=} -14$$

$$(-168 + 154) \stackrel{?}{=} -14$$

$$-14 = -14$$

## Try It

23) Translate and solve: The difference of  $4x$  and  $3x$  is 14.

**Solution**

$$4x - 3x = 14$$

$$x = 14$$

24) Translate and solve: The difference of  $7a$  and  $6a$  is  $-8$ .

**Solution**

$$7a - 6a = -8$$

$$a = -8$$

## Translate and Solve Applications

Most of the time a question that requires an algebraic solution comes out of a real-life question. To begin with, that question is asked in English (or the language of the person asking) and not in math symbols. Because of this, it is an important skill to be able to translate an everyday situation into algebraic language.

We will start by restating the problem in just one sentence, assigning a variable, and then translating the sentence into an equation to solve. When assigning a variable, choose a letter that reminds you of what you are looking for. For example, you might use  $q$  for the number of quarters if you were solving a problem about coins.

### Example 3.1.11

The MacIntyre family recycled newspapers for two months. The two months of newspapers weighed a total of 57 pounds. The second month, the newspapers weighed 28 pounds. How much did the newspapers weigh the first month?

#### **Solution**

##### **Step 1: Read the problem.**

Make sure all the words and ideas are understood.

The problem is about the weight of newspapers.

##### **Step 2: Identify what we are asked to find.**

What are we asked to find?

“How much did the newspapers weigh the 2<sup>nd</sup> month?”

##### **Step 3: Name what we are looking for.**

Choose a variable to represent that quantity.

Let  $w$  = weight of the newspapers the 1<sup>st</sup> month

##### **Step 4: Translate into an equation.**

It may be helpful to restate the problem in one sentence with the important information.

Restate the problem.

Weight of newspapers the 1<sup>st</sup> month plus the weight of the newspapers the 2<sup>nd</sup> month equals 57 pounds.

We know the weight of the newspapers the second month is 28 pounds.

Weight from 1<sup>st</sup> month plus 2<sup>nd</sup> month equals 57 pounds.

Translate into an equation, using the variable  $w$ .

$$w + 28 = 57$$

##### **Step 5: Solve the equation using good algebra techniques.**

$$w + 28 - 28 = 57 - 28$$

$$w = 29$$

**Step 6: Check the answer in the problem and make sure it makes sense.**

Does 1<sup>st</sup> month's weight plus 2<sup>nd</sup> month's weight equal 57 pounds?

$$29 + 28 \stackrel{?}{=} 57$$

$$57 = 57 \checkmark$$

**Step 7: Answer the question with a complete sentence.**

Write a sentence to answer “How much did the newspapers weigh the 2<sup>nd</sup> month?”

The 2<sup>nd</sup> month the newspapers weighed 29 pounds.

## Translate into an algebraic equation and solve:

### HOW TO

#### Solve an application.

1. Read the problem. Make sure all the words and ideas are understood.
2. Identify what we are looking for.
3. Name what we are looking for. Choose a variable to represent that quantity.
4. Translate into an equation. It may be helpful to restate the problem in one sentence with the important information.
5. Solve the equation using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

### Example 3.1.12

Randell paid \$28,675 for his new car. This was \$875 less than the sticker price. What was the sticker price of the car?

#### **Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

“What was the sticker price of the car?”

**Step 3: Name what we are looking for.**

Choose a variable to represent that quantity.

Let  $s$  = the sticker price of the car.

**Step 4: Translate into an equation. Restate the problem in one sentence.**

\$28,675 is \$875 less than the sticker price

\$28,675 is \$875 less than  $s$

**Step 5: Solve the equation.**

$$28675 = s - 875$$

$$28675 + 875 = s - 875 + 875$$

$$29550 = s$$

**Step 6: Check the answer.**

Is \$875 less than \$29,550? Equal to \$28,675?

$$29,550 - 875 \stackrel{?}{=} 28,675$$

$$28,675 = 28,675$$

**Step 7: Answer the question with a complete sentence.**

The sticker price of the car was \$29,550.

## Try It

25) Translate into an algebraic equation and solve:

The Pappas family has two cats, Zeus and Athena. Together, they weigh 23 pounds. Zeus weighs 16 pounds. How much does Athena weigh?

**Solution**

7 pounds

26) Translate into an algebraic equation and solve:

Sam and Henry are roommates. Together, they have 68 books. Sam has 26 books. How many books does Henry have?

**Solution**

42 books

27) Translate into an algebraic equation and solve:

Eddie paid \$19,875 for his new car. This was \$1,025 less than the sticker price. What was the sticker price of the car?

**Solution**

\$20,900

28) Translate into an algebraic equation and solve:

The admission price for the movies during the day is \$7.75. This is \$3.25 less the price at night. How much does the movie cost at night?

**Solution**

\$11.00

## Key Concepts

- **To Determine Whether a Number is a Solution to an Equation**

1. **Substitute the number in for the variable in the equation.**
2. **Simplify the expressions on both sides of the equation.**
3. **Determine whether the resulting statement is true.**
  - If it is true, the number is a solution.
  - If it is not true, the number is not a solution.

- **Addition Property of Equality**

- For any numbers  $a$ ,  $b$ , and  $c$ , if  $a = b$ , then  $a + c = b + c$ .

- **Subtraction Property of Equality**

- For any numbers
- $a$ ,  $b$ , and  $c$ , if  $a = b$ , then  $a - c = b - c$ .

- **To Translate a Sentence to an Equation**

1. Locate the “equals” word(s). Translate to an equal sign ( $=$ ).
2. Translate the words to the left of the “equals” word(s) into an algebraic expression.
3. Translate the words to the right of the “equals” word(s) into an algebraic expression.

- **To Solve an Application**

1. Read the problem. Make sure all the words and ideas are understood.
2. Identify what we are looking for.
3. Name what we are looking for. Choose a variable to represent that quantity.
4. Translate into an equation. It may be helpful to restate the problem in one sentence with the important information.
5. Solve the equation using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=556#h5p-8>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## Glossary

### **solution of an equation**

solution of an equation is a value of a variable that makes a true statement when substituted into the equation.

## 3.2 SOLVE EQUATIONS USING THE DIVISION AND MULTIPLICATION PROPERTIES OF EQUALITY

---

### Learning Objectives

By the end of this section, you will be able to:

- Solve equations using the Division and Multiplication Properties of Equality
- Solve equations that require simplification
- Translate to an equation and solve
- Translate and solve applications

### Try It

Before you get started, take this readiness quiz:

1) Simplify:  $-7 \cdot \frac{1}{-7}$ .

2) Evaluate  $9x + 2$  when  $x = -3$ .

### Solve Equations Using the Division and Multiplication

## Properties of Equality

You may have noticed that all of the equations we have solved so far have been of the form  $x + a = b$  or  $x - a = b$ . We were able to isolate the variable by adding or subtracting the constant term on the side of the equation with the variable. Now we will see how to solve equations that have a variable multiplied by a constant and so will require the division to isolate the variable.

Let's look at our puzzle again with the envelopes and counters in Figure 3.2.1.

The illustration shows a model of an equation with one variable multiplied by a constant. On the left side of the workspace are two instances of the unknown (envelope), while on the right side of the workspace are six counters.

Figure 3.2.1 – The illustration shows a model of an equation with one variable multiplied by a constant. On the left side of the workspace are two instances of the unknown (envelope), while on the right side of the workspace are six counters.

In the illustration, there are two identical envelopes that contain the same number of counters. Remember, the left side of the workspace must equal the right side, but the counters on the left side are “hidden” in the envelopes. So how many counters are in each envelope?

How do we determine the number? We have to separate the counters on the right side into two groups of the same size to correspond with the two envelopes on the left side. The 6 counters divided into 2 equal groups gives 3 counters in each group (since  $6 \div 2 = 3$ ).

What equation models the situation shown in Figure 3.2.2? There are two envelopes, and each contains  $x$  counters. Together, the two envelopes must contain a total of 6 counters.

The illustration shows a model of the equation  $2x = 6$ .

Figure 3.2.2 – The illustration shows a model of the equation  $2x = 6$ .

---

$$2x = 6$$

If we divide both sides of the equation by 2, as we did with the envelopes and counters,  $\frac{2x}{2} = \frac{6}{2}$

we get:

$$x = 3$$

---

We found that each envelope contains 3 counters. Does this check? We know  $2 \cdot 3 = 6$ , so it works! Three counters in each of two envelopes do equal six!

This example leads to the Division Property of Equality.

## The Division Property of Equality

For any numbers  $a$ ,  $b$ , and  $c$ , if  $a = b$ , and  $c \neq 0$ ,

If  $a = b$ ,

then  $\frac{a}{c} = \frac{b}{c}$

When you divide both sides of an equation by any non-zero number, you still have equality.

The goal in solving an equation is to ‘undo’ the operation on the variable. In the next example, the variable is multiplied by 5, so we will divide both sides by 5 to ‘undo’ the multiplication.

### Example 3.2.1

Solve:  $5x = -27$ .

#### Solution

**Step 1:** To isolate  $x$ , “undo” the multiplication by 5.

$$5x = -27$$

**Step 2:** Divide to ‘undo’ the multiplication.

$$\begin{array}{rcl} \frac{5x}{\color{red}{5}} & = & -\frac{27}{\color{red}{5}} \\ \text{Simplify.} & & x = -\frac{27}{5} \end{array}$$

**Step 3:** Check:

$$5x = -27$$

**Step 5:** Substitute  $-\frac{27}{5}$  for  $x$ .

$$\begin{array}{rcl} 5 \left( -\frac{\color{red}{27}}{\color{red}{5}} \right) & \stackrel{?}{=} & -27 \\ -27 & = & -27 \checkmark \end{array}$$

Since this is a true statement,  $x = -\frac{27}{5}$  is the solution to  $5x = -27$ .

### Try It

3) Solve:  $3y = -41$ .

**Solution**

$$y = \frac{-41}{3}$$

4) Solve:  $4z = -55$ .

**Solution**

$$z = -\frac{55}{4}$$

Consider the equation  $\frac{x}{4} = 3$ . We want to know what number divided by 4 gives 3. So to “undo” the division, we will need to multiply by 4. The Multiplication Property of Equality will allow us to do this. This property says that if we start with two equal quantities and multiply both by the same number, the results are equal.

### The Multiplication Property of Equality

For any numbers  $a$ ,  $b$ , and  $c$ ,

If  $a = b$ ,

Then  $ac = bc$

If you multiply both sides of an equation by the same number, you still have equality.

### Example 3.2.2

Solve:  $\frac{y}{-7} = -14$ .

**Solution**

Here  $y$  is divided by  $-7$ . We must multiply by  $-7$  to isolate  $y$ .

**Step 1: Multiply both sides by  $-7$ .**

$$\frac{5x}{5} = -\frac{27}{5}$$

Simplify.

$$x = -\frac{27}{5}$$

**Step 2: Check:**  $\frac{y}{-7} = -14$

**Step 3: Substitute  $y = 98$ .**

$$\frac{98}{-7} \stackrel{?}{=} -14$$

$$-14 = -14 \checkmark$$

## Try It

5) Solve:  $\frac{a}{-7} = -42$ .

**Solution**

$$a = 294$$

6) Solve:  $\frac{b}{-6} = -24$ .

**Solution**

$$b = 144$$

### Example 3.2.3

Solve:  $-n = 9$ .

#### Solution

**Step 1: Remember**  $-n$  is equivalent to  $-1n$ .

$$-1n = 9$$

**Step 2: Divide both sides by  $-1$ .**

$$\begin{array}{rcl} \frac{-1n}{-1} & = & \frac{9}{-1} \\ \text{Divide} & & n = -9 \end{array}$$

Notice that there are two other ways to solve  $-n = 9$ . We can also solve this equation by multiplying both sides by  $-1$  and also by taking the opposite of both sides.

**Step 3: Check:**

$$-n = 9$$

**Step 4: Substitute**  $n = -9$ .

$$\begin{array}{rcl} & -(-9) & \stackrel{?}{=} 9 \\ \text{Simplify} & 9 & = 9 \checkmark \end{array}$$

### Try It

7) Solve:  $-k = 8$ .

#### Solution

$$k = -8$$

8) Solve:  $-g = 3$ .

**Solution**

$$g = -3$$

### Example 3.2.4

Solve:  $\frac{3}{4}x = 12$ .

**Solution**

Since the product of a number and its reciprocal is **1**, our strategy will be to isolate  $x$  by multiplying by the reciprocal of  $\frac{3}{4}$ .

**Step 1: Multiply by the reciprocal of  $\frac{3}{4}$ .**

Reciprocals multiply to 1

Multiply.

$$\begin{aligned}\frac{4}{3} \cdot \frac{3}{4}x &= \frac{4}{3} \cdot 12 \\ 1x &= \frac{4}{3} \cdot \frac{12}{1} \\ x &= 16\end{aligned}$$

Notice that we could have divided both sides of the equation  $\frac{3}{4}x = 12$  by  $\frac{3}{4}$  to isolate  $x$ . While this would work, most people would find multiplying by the reciprocal easier.

**Step 2: Check:**

**Step 5: Substitute  $x = 16$ .**

$$\begin{aligned}\frac{3}{4}x &= 12 \\ \frac{3}{4} \cdot 16 &\stackrel{?}{=} 12 \\ 12 &= 12\checkmark\end{aligned}$$

## Try It

9) Solve:  $\frac{2}{5}n = 14$ .

**Solution**

$$n = 35$$

10) Solve:  $\frac{5}{6}y = 15$ .

**Solution**

$$y = 18$$

In the next example, all the variable terms are on the right side of the equation. As always, our goal in solving the equation is to isolate the variable.

### Example 3.2.5

Solve:  $\frac{8}{15} = -\frac{4}{5}x$ .

#### Solution

**Step 1:** Multiply by the reciprocal of  $-\frac{4}{5}$ .

Reciprocals multiply to 1

Multiply.

**Step 2:** Let  $x = -\frac{2}{3}$ .

$$\begin{aligned} \left(-\frac{5}{4}\right) \left(\frac{8}{15}\right) &= \left(-\frac{5}{4}\right) \left(-\frac{4}{5}x\right) \\ -\frac{\cancel{5} \cdot \cancel{4} \cdot 2}{\cancel{4} \cdot 3 \cdot \cancel{5}} &= 1x \\ -\frac{2}{3} &= x \end{aligned}$$

$$\begin{aligned} \frac{8}{15} &= -\frac{4}{5}x \\ \frac{8}{15} &= -\frac{4}{5} \left(-\frac{2}{3}\right) \\ \frac{8}{15} &= \frac{8}{15} \checkmark \end{aligned}$$

## Try It

11) Solve:  $\frac{9}{25} = -\frac{4}{5}z$ .

**Solution**

$$z = -\frac{9}{5}$$

12) Solve:  $\frac{5}{6} = -\frac{8}{3}r$

**Solution**

$$r = -\frac{5}{16}$$

## Solve Equations That Require Simplification

Many equations start out more complicated than the ones we have been working with.

With these more complicated equations, the first step is to simplify both sides of the equation as much as possible. This usually involves combining like terms or using the distributive property.

### Example 3.2.6

Solve:  $14 - 23 = 12y - 4y - 5y$ .

**Solution**

Begin by simplifying each side of the equation.

**Step 1: Simplify each side.**

$$-9 = 3y$$

**Step 2: Divide both sides by 3 to isolate  $y$ .**

$$\begin{array}{rcl} \frac{-9}{3} & = & \frac{3y}{3} \\ \text{Divide.} & & -3 = y \end{array}$$

**Step 3: Check:**

$$14 - 23 \stackrel{?}{=} 12y - 4y - 5y$$

**Step 4: Substitute  $y = -3$ .**

$$\begin{aligned} 14 - 23 &\stackrel{?}{=} 12(-3) - 4(-3) - 5(-3) \\ 14 - 23 &\stackrel{?}{=} -36 + 12 + 15 \\ -9 &= -9 \checkmark \end{aligned}$$

## Try It

13) Solve:  $18 - 27 = 15c - 9c - 3c$ .

**Solution**

$$c = -3$$

14) Solve:  $18 - 22 = 12x - x - 4x$ .

**Solution**

$$x = -\frac{4}{7}$$

### Example 3.2.7

Solve:  $-4(a - 3) - 7 = 25$ .

#### Solution

Here we will simplify each side of the equation by using the distributive property first.

#### Step 1: Distribute.

$$\begin{array}{rcl} & -4a + 12 - 7 = 25 \\ \text{Simplify.} & & -4a + 5 = 25 \\ \text{Simplify.} & & -4a = 20 \end{array}$$

#### Step 2: Divide both sides by $-4$ to isolate $a$ .

$$\begin{array}{rcl} & \left( \frac{-4a}{-4} \right) = \left( \frac{20}{-4} \right) \\ \text{Divide.} & & a = -5 \end{array}$$

#### Step 3: Check:

$$-4(a - 3) - 7 = 25$$

#### Step 4: Substitute $a = -5$ .

$$\begin{array}{rcl} -4(-5 - 3) - 7 & \stackrel{?}{=} & 25 \\ -4(-8) - 7 & \stackrel{?}{=} & 25 \\ 32 - 7 & \stackrel{?}{=} & 25 \\ 25 & = & 25 \checkmark \end{array}$$

## Try It

15) Solve:  $-4(q - 2) - 8 = 24$ .

**Solution**

$$q = -6$$

16) Solve:  $-6(r - 2) - 12 = 30$ .

**Solution**

$$r = -5$$

Now we have covered all four properties of equality—subtraction, addition, division, and multiplication. We'll list them all together here for easy reference.

## Properties of Equality

---

### Subtraction Property of Equality

for any real numbers  $a$ ,  $b$  and  $c$ ,

$$\text{If } a = b,$$

$$\text{then } a - c = b - c.$$

### Addition Property of Equality

for any real numbers  $a$ ,  $b$  and  $c$ ,

$$\text{If } a = b,$$

$$\text{then } a + c = b + c.$$

### Division Property of Equality

for any real numbers  $a$ ,  $b$  and  $c$ , and

$$c \neq 0$$

$$\text{If } a = b,$$

$$\text{then } \frac{a}{c} = \frac{b}{c}.$$

### Multiplication Property of Equality

for any real numbers  $a$ ,  $b$  and  $c$ ,

$$\text{If } a = b,$$

$$\text{then } a \times c = b \times c.$$

---

When you add, subtract, multiply, or divide the same quantity from both sides of an equation, you still have equality.

## Translate to an Equation and Solve

In the next few examples, we will translate sentences into equations and then solve the equations. You might want to review the translation table in the previous chapter.

### Example 3.2.8

Translate and solve: The number **143** is the product of **−11** and ***y***.

#### Solution

Begin by translating the sentence into an equation.

#### Step 1: Translate.

$$\underbrace{\text{The number } 143}_{143} \underbrace{\text{is}}_{=} \underbrace{\text{the product of } -11 \text{ and } y}_{-11y}$$

#### Step 2: Divide by **−11**.

$$\frac{143}{-11} = \frac{-11y}{-11}$$

#### Step 3: Simplify.

$$-13 = y$$

#### Step 4: Check:

$$\begin{aligned} 143 &= -11y \\ 143 &\stackrel{?}{=} -11(-13) \\ 143 &= 143 \checkmark \end{aligned}$$

### Try It

17) Translate and solve: The number **132** is the product of **−12** and ***y***.

#### Solution

$$132 = -12y; \quad y = -11$$

18) Translate and solve: The number **117** is the product of **−13** and  $z$ .

**Solution**

$$117 = -13z; \quad z = -9$$

### Example 3.2.9

Translate and solve:  $n$  divided by 8 is **−32**.

**Solution**

**Step 1: Begin by translating the sentence into an equation.**

$$\underbrace{n \text{ divided by } 8}_{\frac{n}{8}} \underbrace{\text{is}}_{=} \underbrace{-32}_{-32}.$$

**Step 2: Multiple both sides by 8.**

$$\begin{array}{l} \text{Simplify.} \quad 8 \cdot \frac{n}{8} = 8(-32) \\ n = -256 \end{array}$$

**Step 3: Check:**

Is  $n$  divided by 8 equal to **−32**?

**Step 4: Let  $n = -256$ .**

$$\begin{array}{l} \frac{-256}{8} \stackrel{?}{=} -32 \\ -31 = -32 \checkmark \end{array}$$

## Try It

19) Translate and solve:  $n$  divided by 7 is equal to  $-21$ .

**Solution**

$$\frac{n}{7} = -21; \quad n = -147$$

20) Translate and solve:  $n$  divided by 8 is equal to  $-56$ .

**Solution**

$$\frac{n}{8} = -56; \quad n = -448$$

## Example 3.2.10

Translate and solve: The quotient of  $y$  and  $-4$  is 68.

**Solution**

Begin by translating the sentence into an equation.

**Step 1: Translate.**

$$\underbrace{\text{The quotient of } y \text{ and } -4}_{\frac{y}{-4}} \text{ is } \underbrace{68}_{68}.$$

**Step 2: Multiply both sides by  $-4$ .**

$$\begin{array}{l} \text{Simplify.} \end{array} \quad -4 \left( \frac{y}{-4} \right) = -4(68)$$

$$y = -272$$

**Step 3: Check:**

Is the quotient of  $y$  and  $-4$  equal to  $68$ ?

**Step 4: Let**  $y = -272$ .

$$\begin{array}{r} \frac{-272}{-4} \stackrel{?}{=} 68 \\ 68 = 68 \checkmark \end{array}$$

**Try It**

21) Translate and solve: The quotient of  $q$  and  $-8$  is  $72$ .

**Solution**

$$\frac{q}{-8} = 72; \quad q = -576$$

22) Translate and solve: The quotient of  $p$  and  $-9$  is  $81$ .

**Solution**

$$\frac{p}{-9} = 81; \quad p = -729$$

**Example 3.2.11**

Translate and solve: Three-fourths of  $p$  is  $18$ .

**Solution**

Begin by translating the sentence into an equation. Remember, “of” translates into multiplication.

**Step 1: Translate.**

$$\underbrace{\text{Three-fourths of } p}_{\frac{3}{4}p} \text{ is } \underbrace{18}_{18}.$$

**Step 2: Multiply both sides by  $\frac{4}{3}$ .**

$$\frac{4}{3} \cdot \frac{3}{4}p = \frac{4}{3} \cdot 18$$

Simplify.  $p = 24$

**Step 3: Check:**

Is three-fourths of  $p$  equal to 18?

**Step 5: Let  $p = 24$ .**

Is three-fourths of 24 equal to 18?

$$\frac{3}{4} \times 24 \stackrel{?}{=} 18$$

$$18 = 18 \checkmark$$

## Try It

23) Translate and solve: Two-fifths of  $f$  is 16.

**Solution**

$$\frac{2}{5} = 16; f = 40$$

24) Translate and solve: Three-fourths of  $f$  is 21.

**Solution**

$$\frac{3}{4} = 21; f = 28$$

### Example 3.2.12

Translate and solve: The sum of three-eighths and  $x$  is one-half.

#### Solution

Begin by translating the sentence into an equation.

#### Step 1: Translate.

$$\underbrace{\text{The sum of three-eighths and } x}_{\frac{3}{8} + x} \text{ is } \frac{1}{2}$$

$$\frac{3}{8} + x = \frac{1}{2}$$

#### Step 2: Subtract $\frac{3}{8}$ from each side.

$$\begin{aligned} \frac{3}{8} - \frac{3}{8} + x &= \frac{1}{2} - \frac{3}{8} \\ x &= \frac{4}{8} - \frac{3}{8} \\ x &= \frac{1}{8} \end{aligned}$$

Simplify and rewrite fractions with common denominators.

Simplify.

#### Step 3: Check:

Is the sum of three-eighths and  $x$  equal to one-half?

#### Step 4: Let $x = \frac{1}{8}$

Is the sum of three-eighths and one-eighth equal to one-half?

$$\begin{array}{l} \text{Simplify.} \\ \text{Simplify.} \end{array} \quad \begin{array}{l} \frac{3}{8} + \frac{1}{8} \stackrel{?}{=} \frac{1}{2} \\ \frac{4}{8} \stackrel{?}{=} \frac{1}{2} \\ \frac{1}{2} = \frac{1}{2} \checkmark \end{array}$$

## Try It

25) Translate and solve: The sum of five-eighths and  $x$  is one-fourth.

**Solution**

$$\frac{5}{8} + x = \frac{1}{4}; \quad x = -\frac{3}{8}$$

26) Translate and solve: The sum of three-fourths and  $x$  is five-sixths.

**Solution**

$$\frac{3}{4} + x = \frac{5}{6}; \quad x = \frac{1}{12}$$

## Translate and Solve Applications

To solve applications using the Division and Multiplication Properties of Equality, we will follow the same steps we used in the last section. We will restate the problem in just one sentence, assign a variable, and then translate the sentence into an equation to solve.

### Example 3.2.13

Denae bought 6 pounds of grapes for \$10.74. What was the cost of one pound of grapes?

**Solution**

**Step 1: What are you asked to find?**

The cost of 1 pound of grapes

**Step 2: Assign a variable.**

Let  $c$  = the cost of one pound.

**Step 3: Write a sentence that gives the information to find it.**

The cost of 6 pounds is \$10.74.

**Step 4: Translate into an equation.**

$$6c = 10.74$$

**Step 5: Solve.**

$$\frac{4}{3}(12,000) = \frac{4}{3} \times \frac{3}{4}p$$

$$16,000 = p$$

The grapes cost \$1.79 per pound.

**Step 6: Check:**

If one pound costs \$1.79, do 6 pounds cost \$10.74?

$$6(1.79) \stackrel{?}{=} 10.74$$

$$10.74 = 10.74 \checkmark$$

## Try It

27) Translate and solve:

Arianna bought a 24-pack of water bottles for **\$9.36**. What was the cost of one water bottle?

**Solution**

**\$0.39**

28) Translate and solve:

At JB's Bowling Alley, 6 people can play on one lane for **\$34.98**. What is the cost for each person?

**Solution**

**\$5.83**

## Example 3.2.14

Andreas bought a used car for **\$12,000**. Because the car was 4-years old, its price was  $\frac{3}{4}$  of the original price, when the car was new. What was the original price of the car?

**Solution**

**Step 1: What are you asked to find?**

The original price of the car

**Step 2: Assign a variable.**

$p$  = the original price.

**Step 3: Write a sentence that gives the information to find it.**

\$12,000 is  $\frac{3}{4}$  of the original price.

**Step 4: Translate into an equation.**

$$12,000 = \frac{3}{4}p$$

**Step 5: Solve.**

$$\frac{4}{3} \times (12,000) = \frac{4}{3} \times \frac{3}{4}p$$

$$16,000 = p$$

The original cost of the car was \$16,000.

**Step 6: Check:**

Is  $\frac{3}{4}$  of \$16,000 equal to \$12,000?

$$\frac{3}{4} \times (16,000) \stackrel{?}{=} 12,000$$

$$12,000 = 12,000 \checkmark$$

## Try It

29) Translate and solve:

The annual property tax on the Mehta's house is \$1,800, calculated as  $\frac{15}{1,000}$  of the assessed value of the house. What is the assessed value of the Mehta's house?

**Solution**

\$120,000

30) Translate and solve:

Stella planted 14 flats of flowers in  $\frac{2}{3}$  of her garden. How many flats of flowers would she need to fill the whole garden?

**Solution**

21 flats

## Key Concepts

- **The Division Property of Equality**—For any numbers  $a$ ,  $b$ , and  $c$ , and  $c \neq 0$ , if  $a = b$ , then  $\frac{a}{c} = \frac{b}{c}$ .

When you divide both sides of an equation by any non-zero number, you still have equality.

- **The Multiplication Property of Equality**—For any numbers  $a$ ,  $b$ , and  $c$ , if  $a = b$ , then  $ac = bc$ .

If you multiply both sides of an equation by the same number, you still have equality.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it*

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## 3.3 SOLVE EQUATIONS WITH VARIABLES AND CONSTANTS ON BOTH SIDES

---

### Learning Objectives

By the end of this section, you will be able to:

- Solve an equation with constants on both sides
- Solve an equation with variables on both sides
- Solve an equation with variables and constants on both sides

### Try It

Before you get started, take this readiness quiz:

1) Simplify:  $4y - 9 + 9$ .

### Solve Equations with Constants on Both Sides

In all the equations we have solved so far, all the variable terms were on only one side of the equation with the constants on the other side. This does not happen all the time—so now we will learn to solve equations in which the variable terms, or constant terms, or both are on both sides of the equation.

Our strategy will involve choosing one side of the equation to be the “variable side”, and the other side of the equation to be the “constant side.” Then, we will use the Subtraction and Addition Properties of Equality to get all the variable terms together on one side of the equation and the constant terms together on the other side.

By doing this, we will transform the equation that began with variables and constants on both sides into the form  $ax = b$ . We already know how to solve equations of this form by using the Division or Multiplication Properties of Equality.

### Example 3.3.1

Solve:  $7x + 8 = -13$ .

#### Solution

In this equation, the variable is found only on the left side. It makes sense to call the left side the “variable” side. Therefore, the right side will be the “constant” side. We will write the labels above the equation to help us remember what goes where.

$$\overset{\text{variable}}{7x} + \overset{\text{constant}}{8} = -13$$

Since the left side is the “ $x$ ”, or variable side, the 8 is out of place. We must “undo” adding 8 by subtracting 8, and to keep the equality we must subtract 8 from both sides.

#### Step 1: Use the Subtraction Property of Equality.

$$\begin{array}{rcl} 7x + 8 - 8 & = & -13 - 8 \\ \text{Simplify} & & 7x = -21 \end{array}$$

Now all the variables are on the left and the constant on the right.

The equation looks like those you learned to solve earlier.

#### Step 2: Use the Division Property of Equality.

$$\begin{array}{rcl} \frac{7x}{7} & = & \frac{-21}{7} \\ \text{Simplify} & & x = -3 \end{array}$$

#### Step 3: Check:

$$7x + 8 = -13$$

**Step 4: Let  $x = -3$ .**

$$7(-3) + 8 \stackrel{?}{=} -13$$

$$-21 + 8 \stackrel{?}{=} -13$$

$$-13 = -13 \checkmark$$

## Try It

2) Solve:  $3x + 4 = -8$ .

**Solution**

$$x = -4$$

3) Solve:  $5a + 3 = -37$ .

**Solution**

$$a = -8$$

## Example 3.3.2

Solve:  $8y - 9 = 31$ .

**Solution**

Notice, the variable is only on the left side of the equation, so we will call this side the “variable” side, and the right side will be the “constant” side. Since the left side is the “variable” side, the **9** is

out of place. It is subtracted from the  $8y$ , so to “undo” subtraction, add  $9$  to both sides. Remember, whatever you do to the left, you must do to the right.

$$\overset{\text{variable}}{8y} - \overset{\text{constant}}{9} = 31$$

**Step 1: Add 9 to both sides.**

$$\begin{array}{l} 8y - 9 + 9 = 31 + 9 \\ \text{Simplify} \qquad \qquad \qquad 8y = 40 \end{array}$$

The variables are now on one side and the constants on the other.

We continue from here as we did earlier.

**Step 2: Divide both sides by 8.**

$$\begin{array}{l} \frac{8y}{8} = \frac{40}{8} \\ \text{Simplify} \qquad \qquad \qquad y = 5 \end{array}$$

**Step 3: Check:**

$$8y - 9 = 31$$

**Step 4: Let  $y = 5$ .**

$$\begin{array}{l} 8 \cdot 5 - 9 \stackrel{?}{=} 31 \\ 40 - 9 \stackrel{?}{=} 31 \\ 31 = 31 \checkmark \end{array}$$

## Try It

4) Solve:  $5y - 9 = 16$ .

**Solution**

$$y = 5$$

5) Solve:  $3m - 8 = 19$ .

**Solution**

$$m = 9$$

## Solve Equations with Variables on Both Sides

What if there are variables on both sides of the equation? For equations like this, begin as we did above—choose a “variable” side and a “constant” side, and then use the subtraction and addition properties of equality to collect all variables on one side and all constants on the other side.

### Example 3.3.3

Solve:  $9x = 8x - 6$ .

**Solution**

Here the variable is on both sides, but the constants only appear on the right side, so let's make the right side the “constant” side. Then the left side will be the “variable” side.

$$\overset{\text{variable}}{9x} = \overset{\text{constant}}{8x - 6}$$

**Step 1:** We don't want any  $x$ 's on the right, so subtract the  $8x$  from both sides.

$$\begin{array}{rcl} 9x - 8x & = & 8x - 8x - 6 \\ \text{Simplify} & & x = 6 \end{array}$$

We succeeded in getting the variables on one side and the constants on the other, and have obtained the solution.

**Step 3: Check:**

$$9x = 8x - 6$$

**Step 4:** Let  $x = -6$ .

$$\begin{aligned}
 9x(-6) &\stackrel{?}{=} 8x(-6) - 6 \\
 -54 &\stackrel{?}{=} -48 - 6 \\
 -54 &= -54 \checkmark
 \end{aligned}$$

## Try It

6) Solve:  $6n = 5n - 10$ .

**Solution**

$$n = -10$$

7) Solve:  $-6c = -7c - 1$ .

**Solution**

$$c = -1$$

## Example 3.3.4

Solve:  $5y - 9 = 8y$ .

**Solution**

The only constant is on the left and the  $y$ 's are on both sides. Let's leave the constant on the left and get the variables to the right.

$$\begin{array}{ccc}
 \text{constant} & & \text{variable} \\
 5y - 9 = & 8y
 \end{array}$$

**Step 1: Subtract  $5y$  from both sides.**

$$\begin{array}{rcl} 5y - 5y - 9 & = & 8y - 5y \\ \text{Simplify} & & -9 = 3y \end{array}$$

**Step 2: We have the  $y$ 's on the right and the constants on the left. Divide both sides by 3.**

$$\begin{array}{rcl} \frac{-9}{3} & = & \frac{3y}{3} \\ \text{Simplify} & & -3 = y \end{array}$$

**Step 3: Check:**

$$5y - 9 = 8y$$

**Step 4: Let  $y = -3$ .**

$$\begin{array}{rcl} 5(-3) - 9 & \stackrel{?}{=} & 8(-3) \\ -15 - 9 & \stackrel{?}{=} & -24 \\ -24 & = & -24 \checkmark \end{array}$$

## Try It

8) Solve:  $3p - 14 = 5p$ .

**Solution**

$$p = -7$$

9) Solve:  $8m + 9 = 5m$ .

**Solution**

$$m = -3$$

### Example 3.3.5

Solve:  $12x = -x + 26$ .

#### Solution

The only constant is on the right, so let the left side be the “variable” side.

$$\overset{\text{variable}}{12x} = -\overset{\text{constant}}{x} + 26$$

**Step 1:** Remove the  $-x$  from the right side by adding  $x$  to both sides.

$$\begin{array}{l} 12x + x = -x + x + 26 \\ \text{Simplify} \qquad 13x = 26 \end{array}$$

**Step 2:** All the  $x$ 's are on the left and the constants are on the right. Divide both sides by 13.

$$\begin{array}{l} \frac{13x}{13} = \frac{26}{13} \\ \text{Simplify} \qquad 1x = 2 \end{array}$$

### Try It

10) Solve:  $12j = -4j + 32$ .

#### Solution

$$j = 2$$

11) Solve:  $8h = -4h + 12$ .

#### Solution

$$h = 1$$

## Solve Equations with Variables and Constants on Both Sides

The next example will be the first to have variables and constants on both sides of the equation. It may take several steps to solve this equation, so we need a clear and organized strategy.

### Example 3.3.6

Solve:  $7x + 5 = 6x + 2$ .

#### Solution

**Step 1: Choose which side will be the “variable” side – the other side will be the “constant” side.**

The variable terms are  $7x$  and  $6x$ .

Since 7 is greater than 6, we will make the left side the “ $x$ ” side.

The right side will be the “constant” side.

$$\overset{\text{variable}}{7x} + \overset{\text{constant}}{5} = \overset{\text{variable}}{6x} + \overset{\text{constant}}{2}$$

**Step 2: Collect the variable terms to the “variable” side of the equation, using the addition or subtraction property of equality.**

With the right side as the “constant” side, the  $6x$  is out of place, so subtract  $6x$  from both sides.

$$7x - 6x + 5 = 6 - 6x + 2$$

$$\text{Combine like terms.} \quad x + 5 = 2$$

Now, the variable is only on the left side!

**Step 3: Collect all the constants to the other side of the equation, using the addition or subtraction property of equality.**

The right side is the “constant” side, so the 5 is out of place.

$$\text{Subtract from both sides.} \quad x + 5 - 5 = 2 - 5$$

$$\text{Simplify.} \quad x = -3$$

**Step 4: Make the coefficient of the variable equal 1, using the multiplication or division property of equality.**

The coefficient of  $x$  is one.

The equation is solved.

**Step 5: Check.**

Let $x = -3$ .	$7x + 6 = 6x + 2$
Simplify.	$(-3) + 5 = 6(-3) + 2$
Add.	$-21 + 5 = -18 + 2$
	$-16 = -16 \checkmark$

## Try It

12) Solve:  $12x + 8 = 6x + 2$ .

**Solution**

$$x = -1$$

13) Solve:  $9y + 4 = 7y + 12$ .

**Solution**

$$y = 4$$

We'll list the steps below so you can easily refer to them. But we'll call this the 'Beginning Strategy' because we'll be adding some steps later in this chapter.

## HOW TO

### Beginning Strategy for Solving Equations with Variables and Constants on Both Sides of the Equation.

1. Choose which side will be the “variable” side—the other side will be the “constant” side.
2. Collect the variable terms to the “variable” side of the equation, using the Addition or Subtraction Property of Equality.
3. Collect all the constants to the other side of the equation, using the Addition or Subtraction Property of Equality.
4. Make the coefficient of the variable equal 1, using the Multiplication or Division Property of Equality.
5. Check the solution by substituting it into the original equation.

In Step 1, a helpful approach is to make the “variable” side the side that has the variable with the larger coefficient. This usually makes the arithmetic easier.

### Example 3.3.7

Solve:  $8n - 4 = -2n + 6$ .

#### Solution

In the first step, choose the variable side by comparing the coefficients of the variables on each side.

**Step 1:** Since  $8 > -2$ , make the left side the “variable” side.

$$\overset{\text{variable}}{8n} - \overset{\text{constant}}{4} = -2n + 6$$

**Step 2:** We don’t want variable terms on the right side—add  $2n$  to both sides to leave only constants on the right.

$$\begin{array}{l} \text{Combine like terms.} \quad 8n + 2n - 4 = -2n + 2n + 6 \\ 10n - 4 = 6 \end{array}$$

**Step 3:** We don't want any constants on the left side, so add 4 to both sides.

$$10n - 4 + 4 = 6 + 4$$

Simplify

$$10n = 10$$

**Step 4:** The variable term is on the left and the constant term is on the right. To get the coefficient of  $n$  to be one, divide both sides by 10.

$$\frac{10n}{10} = \frac{10}{10}$$

Simplify

$$n = 1$$

**Step 5: Check:**

$$8n - 4 = -2n + 6$$

**Step 6:** Let  $n = 1$ .

$$8 \cdot 1 - 4 \stackrel{?}{=} 2 \cdot 1 + 6$$

$$8 - 4 \stackrel{?}{=} -2 + 6$$

$$4 = 4 \checkmark$$

## Try It

14) Solve:  $8q - 5 = -4q + 7$ .

**Solution**

$$q = 1$$

15) Solve:  $7n - 3 = n + 3$ .

**Solution**

$$n = 1$$

### Example 3.3.8

Solve:  $7a - 3 = 13a + 7$ .

#### Solution

In the first step, choose the variable side by comparing the coefficients of the variables on each side.

Since  $13 > 7$ , make the right side the “variable” side and the left side the “constant” side.

$$\overset{\text{constant}}{7a} - 3 = \overset{\text{variable}}{13a} + 7$$

**Step 1: Subtract  $7a$  from both sides to remove the variable term from the left.**

$$\begin{aligned} 7a - 7a - 3 &= 13a - 7a + 7 \\ \text{Combine like terms.} \quad -3 &= 6a + 7 \end{aligned}$$

**Step 2: Subtract 7 from both sides to remove the constant from the right.**

$$\begin{aligned} -3 - 7 &= 6a + 7 - 7 \\ \text{Simplify.} \quad -10 &= 6a \end{aligned}$$

**Step 3: Divide both sides by 6 to make 1 the coefficient of  $a$ .**

$$\begin{aligned} \frac{-10}{6} &= \frac{6a}{6} \\ \text{Simplify.} \quad -\frac{5}{3} &= a \end{aligned}$$

**Step 4: Check:**

$$7a - 3 = 13a + 7$$

**Step 5: Let  $a = -\frac{5}{3}$ .**

$$\begin{aligned}
 8\left(-\frac{5}{3}\right) - 3 &\stackrel{?}{=} 13\left(-\frac{5}{3}\right) + 7 \\
 -\frac{35}{3} - \frac{9}{3} &\stackrel{?}{=} -\frac{65}{3} + \frac{21}{3} \\
 -\frac{54}{3} &= -\frac{54}{3} \checkmark
 \end{aligned}$$

## Try It

16) Solve:  $2a - 2 = 6a + 18$ .

**Solution**

$$a = -5$$

17) Solve:  $4k - 1 = 7k + 17$ .

**Solution**

$$k = -6$$

In the last example, we could have made the left side the “variable” side, but it would have led to a negative coefficient on the variable term. (Try it!) While we could work with the negative, there is less chance of errors when working with the positives. The strategy outlined above helps avoid the negatives!

To solve an equation with fractions, we just follow the steps of our strategy to get the solution!

### Example 3.3.9

Solve:  $\frac{5}{4}x + 6 = \frac{1}{4}x - 2$ .

#### Solution

Since  $\frac{5}{4} > \frac{1}{4}$ , make the left side the “variable” side and the right side the “constant” side.

$$\overset{\text{variable}}{\frac{5}{4}x} + 6 = \overset{\text{constant}}{\frac{1}{4}x} - 2$$

**Step 1:** Subtract  $\frac{1}{4}x$  from both sides.

$$\frac{5}{4}x - \frac{1}{4}x + 6 = \frac{1}{4}x - \frac{1}{4}x - 2$$

Combine like terms.

$$x + 6 = -2$$

**Step 2:** Subtract 6 from both sides.

$$x + 6 - 6 = -2 - 6$$

**Step 3:** Simplify.

$$x = -8$$

**Step 4:** Check: Let  $x = -8$

$$\begin{aligned}\frac{5}{4}x + 6 &= \frac{1}{4}x - 2 \\ \frac{5}{4}(-8) + 6 &\stackrel{?}{=} \frac{1}{4}(-8) - 2 \\ -10 + 6 &\stackrel{?}{=} -2 - 2 \\ -4 &= -4 \checkmark\end{aligned}$$

## Try It

18) Solve:  $\frac{7}{8}x - 12 = -\frac{1}{8}x - 2$ .

**Solution**

$$x = 10$$

19) Solve:  $\frac{7}{6}y + 11 = \frac{1}{6}y + 8$ .

**Solution**

$$y = -3$$

We will use the same strategy to find the solution for an equation with decimals.

## Example 3.3.10

Solve:  $7.8x + 4 = 5.4x - 8$ .

**Solution**

Since  $7.8 > 5.4$ , make the left side the “variable” side and the right side the “constant” side.

$$\overset{\text{variable side}}{7.8x + 4} = \overset{\text{constant side}}{5.4x - 8}$$

**Step 1: Subtract  $5.4x$  from both sides.**

$$\begin{array}{l} \text{Combine like terms.} \end{array} \quad \begin{array}{l} 7.8x - 5.4x + 4 = 5.4x - 5.4x - 8 \\ 2.4x + 4 = -8 \end{array}$$

**Step 2: Subtract 4 from both sides.**

$$2.4x + 4 - 4 = -8 - 4$$

Simplify.  $2.4x = -12$

**Step 3: Use the Division Property of Equality.**

$$\frac{2.4x}{2.4} = \frac{-12}{2.4}$$

Simplify.  $x = -5$

**Step 4: Check:**

$$7.8x + 4 = 5.4x - 5$$

**Step 5: Let  $x = -5$ .**

$$\begin{aligned} 7.8(-5) + 4 &= 5.4(-5) - 8 \\ -39 + 4 &\stackrel{?}{=} -27 - 8 \\ -35 &= -35 \checkmark \end{aligned}$$

## Try It

20) Solve:  $2.8x + 12 = -1.4x - 9$ .

**Solution**

$$x = -5$$

21) Solve:  $3.6y + 8 = 1.2y - 4$ .

**Solution**

$$y = -5$$

## Key Concepts

### Beginning Strategy for Solving an Equation with Variables and Constants on Both Sides of the Equation

1. Choose which side will be the “variable” side—the other side will be the “constant” side.
2. Collect the variable terms to the “variable” side of the equation, using the Addition or Subtraction Property of Equality.
3. Collect all the constants to the other side of the equation, using the Addition or Subtraction Property of Equality.
4. Make the coefficient of the variable equal 1, using the Multiplication or Division Property of Equality.
5. Check the solution by substituting it into the original equation.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=716#h5p-17>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## 3.4 USE A GENERAL STRATEGY TO SOLVE LINEAR EQUATIONS

---

### Learning Objectives

By the end of this section, you will be able to:

- Solve equations using a general strategy
- Classify equations

### Try It

Before you get started, take this readiness quiz:

- 1) Simplify:  $-(a - 4)$
- 2) Multiply:  $\frac{3}{2}(12x + 20)$ .
- 3) Simplify:  $5 - 2(n + 1)$ .
- 4) Multiply:  $3(7y + 9)$ .
- 5) Multiply:  $(2.5)(6.4)$ .

## Solve Equations Using the General Strategy

Until now we have dealt with solving one specific form of a linear equation. It is time now to lay out one overall strategy that can be used to solve any linear equation. Some equations we solve will not require all these steps to solve, but many will.

Beginning by simplifying each side of the equation makes the remaining steps easier.

### Example 3.4.1

Solve:  $-6(x + 3) = 24$ .

#### Solution

**Step 1: Simplify each side of the equation as much as possible.**

Use the Distributive Property.

$$\begin{aligned} -6(x + 3) &= 24 \\ -6x - 18 &= 24 \end{aligned}$$

Notice that each side of the equation is simplified as much as possible.

**Step 2: Collect all variable terms on one side of the equation.**

Nothing to do – all  $x$ 's are on the left side.

**Step 3: Collect constant terms on the other side of the equation.**

To get constants only on the right, add 18 to each side.

$$\begin{aligned} -6x - 18 + 18 &= 24 + 18 \\ \text{Simplify.} \quad -6x &= 42 \end{aligned}$$

**Step 4: Make the coefficient of the variable term to equal 1.**

$$\begin{aligned} \text{Divide each side by } -6. \quad \frac{-6x}{-6} &= \frac{42}{-6} \\ \text{Simplify.} \quad x &= -7 \end{aligned}$$

**Step 5: Check the solution.**

Let  $x = -7$

$$\begin{aligned} -6(x + 3) &= 24 \\ -6(-7 + 3) &\stackrel{?}{=} 24 \\ \text{Simplify. } -6(-4) &\stackrel{?}{=} 24 \\ \text{Multiply. } 24 &= 24 \end{aligned}$$

## Try It

6) Solve:  $5(x + 3) = 35$ .

**Solution**

$$x = 4$$

7) Solve:  $6(y - 4) = -18$ .

**Solution**

$$y = 1$$

## HOW TO

### General strategy for solving linear equations.

1. Simplify each side of the equation as much as possible.  
Use the Distributive Property to remove any parentheses.  
Combine like terms.
2. Collect all the variable terms on one side of the equation.  
Use the Addition or Subtraction Property of Equality.
3. Collect all the constant terms on the other side of the equation.

- Use the Addition or Subtraction Property of Equality.
4. Make the coefficient of the variable term to equal to 1.  
Use the Multiplication or Division Property of Equality.  
State the solution to the equation.
  5. Check the solution.  
Substitute the solution into the original equation to make sure the result is a true statement.

### Example 3.4.2

Solve:  $-(y + 9) = 8$ .

#### **Solution**

**Step 1:** Simplify each side of the equation as much as possible by distributing.

$$-y - 9 = 8$$

**Step 2:** The only  $y$  term is on the left side, so all variable terms are on the left side of the equation.

**Step 3:** Add 9 to both sides to get all constant terms on the right side of the equation.

$$\begin{array}{l} \text{Simplify.} \quad -y - 9 + 9 = 8 + 9 \\ \quad \quad \quad -y = 17 \end{array}$$

**Step 4:** Rewrite  $-y$  as  $-1y$ .

$$-1y = 17$$

**Step 5:** Make the coefficient of the variable term to equal to 1 by dividing both sides by  $-1$ .

$$\begin{array}{l} \text{Simplify.} \quad \frac{-1y}{-1} = \frac{17}{-1} \\ \quad \quad \quad y = -17 \end{array}$$

**Step 6: Check:**

$$-(y + 9) = 8$$

**Step 7: Let  $y = -17$ .**

$$-(-17 + 9) \stackrel{?}{=} 8$$

$$-(-8) \stackrel{?}{=} 8$$

$$8 = 8 \checkmark$$

## Try It

8) Solve:  $-(y + 8) = -2$ .**Solution**

$$y = -6$$

9) Solve:  $-(z + 4) = -12$ **Solution**

$$z = 8$$

## Example 3.4.3

Solve:  $5(a - 3) + 5 = -10$ .**Solution**

**Step 1: Simplify each side of the equation as much as possible.**

$$\begin{array}{ll} \text{Distribute.} & 5a - 15 + 5 = -10 \\ \text{Combine like terms.} & 5a - 10 = -10 \end{array}$$

**Step 2: The only  $a$  term is on the left side, so all variable terms are on one side of the equation.**

**Step 3: Add 10 to both sides to get all constant terms on the other side of the equation.**

$$\begin{array}{ll} & 5a - 10 + 10 = -10 + 10 \\ \text{Simplify.} & 5a = 0 \end{array}$$

**Step 4: Make the coefficient of the variable term to equal to 1 by dividing both sides by 5.**

$$\begin{array}{ll} & \frac{5a}{5} = \frac{0}{5} \\ \text{Simplify.} & a = 0 \end{array}$$

**Step 5: Check:**

$$5(a - 3) + 5 = -10$$

**Step 6: Let  $a = 0$ .**

$$\begin{aligned} 5(0 - 3) + 5 &\stackrel{?}{=} -10 \\ 5(-3) + 5 &\stackrel{?}{=} -10 \\ -15 + 5 &\stackrel{?}{=} -10 \\ -10 &= -10 \checkmark \end{aligned}$$

## Try It

10) Solve:  $2(m - 4) + 3 = -1$ .

**Solution**

$$m = 2$$

11) Solve:  $7(n - 3) - 8 = -15$ .

**Solution**

$$n = 2$$

### Example 3.4.4

Solve:  $\frac{2}{3}(6m - 3) = 8 - m$ .

**Solution**

**Step 1: Distribute.**

$$4m - 2 = 8 - m$$

**Step 2: Add  $m$  to get the variables only to the left.**

$$4m + m - 2 = 8 - m + m$$

Simplify.  $5m - 2 = 8$

**Step 3: Add 2 to get constants only on the right.**

$$5m - 2 + 2 = 8 + 2$$

Simplify.  $5m = 10$

**Step 4: Divide by 5.**

$$\frac{5m}{5} = \frac{10}{5}$$

Simplify.  $m = 2$

**Step 5: Check:**

$$\frac{2}{3}(6m - 3) = 8 - m$$

**Step 6: Let  $m = 2$ .**

$$\frac{2}{3}(6 \cdot 2 \cdot -3) \stackrel{?}{=} 8 - 2$$

$$\frac{2}{3}(12 - 3) \stackrel{?}{=} 6$$

$$\frac{2}{3}(9) \stackrel{?}{=} 6$$

$$6 = 6 \checkmark$$

## Try It

12) Solve:  $\frac{1}{3}(6u + 3) = 7 - u$ .

**Solution**

$$u = 2$$

13) Solve:  $\frac{2}{3}(9x - 12) = 8 + 2x$ .

**Solution**

$$x = 4$$

## Example 3.4.5

Solve:  $8 - 2(3y + 5) = 0$ .

**Solution**

**Step 1: Simplify—use the Distributive Property.**

$$\begin{array}{rcl} 8 - 6y - 10 & = & 0 \\ \text{Combine like terms.} & & -6y - 2 = 0 \end{array}$$

**Step 2: Add 2 to both sides to collect constants on the right.**

$$\begin{array}{rcl} -6y - 2 + 2 & = & 0 + 2 \\ \text{Simplify.} & & -6y = 2 \end{array}$$

**Step 3: Divide both sides by  $-6$ .**

$$\begin{array}{rcl} \frac{-6y}{-6} & = & \frac{2}{-6} \\ \text{Simplify.} & & y = -\frac{1}{3} \end{array}$$

**Step 4: Check:**

$$\text{Let } y = -\frac{1}{3}$$

$$\begin{array}{rcl} 8 - 2(3y + 5) & = & 0 \\ 8 - 2\left[3\left(-\frac{1}{3}\right) + 5\right] & = & 0 \\ 8 - 2(-1 + 5) & \stackrel{?}{=} & 0 \\ 8 - 2(4) & \stackrel{?}{=} & 0 \\ 8 - 8 & \stackrel{?}{=} & 0 \\ 0 & = & 0 \checkmark \end{array}$$

## Try It

14) Solve:  $12 - 3(4j + 3) = -17$

**Solution**

$$j = \frac{5}{3}$$

15) Solve:  $-6 - 8(k - 2) = -10$ .

**Solution**

$$k = \frac{5}{2}$$

### Example 3.4.6

Solve:  $4(x - 1) - 2 = 5(2x + 3) + 6$ .

**Solution**

**Step 1: Distribute.**

$$4x - 4 - 2 = 10x + 15 + 6$$

Combine like terms.

$$4x - 6 = 10x + 21$$

**Step 2: Subtract  $4x$  to get the variables only on the right side since  $10 > 4$ .**

$$4x - 4x - 6 = 10 - 4x + 21$$

Simplify.

$$-6 = 6x + 21$$

**Step 3: Subtract 21 to get the constants on left.**

$$6 - 21 = 6x + 21 - 21$$

Simplify.

$$-27 = 6x$$

**Step 4: Divide by 6.**

$$\frac{-27}{6} = \frac{6x}{6}$$

Simplify.

$$-\frac{9}{2} = x$$

**Step 5: Check:**

$$4(x - 1) - 2 = 5(2x + 3) + 6$$

**Step 6: Let**  $x = -\frac{9}{2}$ .

$$4\left(-\frac{9}{2}\right) - 2 \stackrel{?}{=} 5\left[2\left(-\frac{9}{2}\right) + 3\right] + 6$$

$$4\left(-\frac{11}{2}\right) - 2 \stackrel{?}{=} 5(-9 + 3) + 6$$

$$-22 - 2 \stackrel{?}{=} 5(-6) + 6$$

$$-24 \stackrel{?}{=} -30 + 6$$

$$-24 = -24 \checkmark$$

## Try It

16) Solve:  $6(p - 3) - 7 = 5(4p + 3) - 12$ .

**Solution**

$$p = -2$$

17) Solve:  $8(q + 1) - 5 = 3(2q - 4) - 1$ .

**Solution**

$$q = -8$$

### Example 3.4.7

Solve:  $10[3 - 8(2s - 5)] = 15(40 - 5s)$ .

**Solution**

**Step 1: Simplify from the innermost parentheses first.**

$$10[3 - 16s + 40] = 15(40 - 5s)$$

**Step 2: Combine like terms in the brackets.**

$$10[43 - 16s] = 15(40 - 5s)$$

**Step 3: Distribute.**

$$430 - 160s = 600 - 75s$$

**Step 4: Add  $160s$  to get the  $s$ 's to the right.**

$$430 - 160 + 160s = 600 - 75s + 160s$$

$$\text{Simplify.} \quad 430 = 600 + 85s$$

**Step 5: Subtract 600 to get the constants to the left.**

$$430 - 600 = 85s + 600 - 600$$

$$\text{Simplify.} \quad -170 = 85s$$

**Step 6: Divide.**

$$\frac{-170}{85} = \frac{85s}{85}$$

$$\text{Simplify.} \quad -2 = s$$

**Step 7: Check:**

$$10[3 - 8(2s - 5)] = 15(40 - 5s)$$

**Step 8: Substitute  $s = -2$ .**

$$\begin{aligned}
 10 [3 - 8 (2(-2) - 5)] &\stackrel{?}{=} 15 (40 - 5 (-2)) \\
 10 [3 - 8 (-4 - 5)] &\stackrel{?}{=} 15 (40 + 10) \\
 10 [3 - 8 (-9)] &\stackrel{?}{=} 15 (50) \\
 10 [3 + 72] &\stackrel{?}{=} 750 \\
 10 [75] &\stackrel{?}{=} 750 \\
 750 &= 750 \checkmark
 \end{aligned}$$

### Try It

18) Solve:  $6[4 - 2(7y - 1)] = 8(13 - 8y)$ .

**Solution**

$$y = -\frac{17}{5}$$

19) Solve:  $12[1 - 5(4z - 1)] = 3(24 + 11z)$ .

**Solution**

$$z = 0$$

### Example 3.4.8

Solve:  $0.36(100n + 5) = 0.6(30n + 15)$ .

**Solution**

**Step 1: Distribute.**

$$36n + 1.8 = 18n + 9$$

**Step 2: Subtract  $18n$  to get the variables to the left.**

$$36n - 18n + 1.8 = 18n - 18n + 9$$

$$\text{Simplify.} \quad 18n + 1.8 = 9$$

**Step 3: Subtract 1.8 to get the constants to the right.**

$$18n + 1.8 - 1.8 = 9 - 1.8$$

$$\text{Simplify.} \quad 18n = 7.2$$

**Step 4: Divide.**

$$\frac{18n}{18} = \frac{7.2}{18}$$

$$\text{Simplify.} \quad n = 0.4$$

**Step 5: Check:**

$$0.35(100n + 5) = 0.6(30n + 15)$$

**Step 6: Let  $n = 0.4$ .**

$$0.36(100(0.4) + 5) \stackrel{?}{=} 0.6(30(0.4) + 15)$$

$$0.36(40 + 5) \stackrel{?}{=} 0.6(12 + 15)$$

$$0.36(45) \stackrel{?}{=} 0.6(27)$$

$$16.2 = 16.2 \checkmark$$

## Try It

20) Solve:  $0.55(100n + 8) = 0.6(85n + 14)$ .

**Solution**

$$n = 1$$

21) Solve:  $0.15(40m - 120) = 0.5(60m + 12)$ .

**Solution**

$$m = -1$$

## Classify Equations

Consider the equation we solved at the start of the last section,  $7x + 8 = -13$ . The solution we found was  $x = -3$ . This means the equation  $7x + 8 = -13$  is true when we replace the variable,  $x$ , with the value  $-3$ . We showed this when we checked the solution  $x = -3$  and evaluated  $7x + 8 = -13$  for  $x = -3$ .

$$\begin{aligned} 7(-3) + 8 &\stackrel{?}{=} -13 \\ -21 + 8 &\stackrel{?}{=} -13 \\ -13 &= -13 \checkmark \end{aligned}$$

If we evaluate  $7x + 8$  for a different value of  $x$ , the left side will not be  $-13$ .

The equation  $7x + 8 = -13$  is true when we replace the variable,  $x$ , with the value  $-3$ , but not true when we replace  $x$  with any other value. Whether or not the equation  $7x + 8 = -13$  is true depends on the value of the variable. Equations like this are called conditional equations.

All the equations we have solved so far are **conditional equations**.

### Conditional equation

An equation that is true for one or more values of the variable and false for all other values of the variable is a conditional equation.

Now let's consider the equation  $2y + 6 = 2(y + 3)$ . Do you recognize that the left side and the right side are equivalent? Let's see what happens when we solve for  $y$ .

	$2y + 6 = 2(y + 3)$
Distribute	$-2y + 6 = 2y + 6$
Subtract $2y$ to get the $y$ 's to one side.	$2y - 2y + 6 = 2 - 2y + 6$
Simplify-the $y$ 's are gone!	$6 = 6$

But  $6 = 6$  is true.

This means that the equation  $2y + 6 = 2(y + 3)$  is true for any value of  $y$ . We say the solution to the equation is all of the real numbers. An equation that is true for any value of a variable like this is called an **identity**.

## Identity

An equation that is true for any value of the variable is called an identity.

The solution of an identity is all real numbers.

What happens when we solve the equation  $5z = 5z - 1$ ?

$$5z = 5z - 1$$

Subtract  $5z$  to get the constant alone on the right.  $5z - 5z = 5z - 5z - 1$

Simplify-the  $z$ 's are gone!

$$0 \neq -1$$

But  $0 \neq -1$

Solving the equation  $5z = 5z - 1$  led to the false statement  $0 = -1$ . The equation  $5z = 5z - 1$  will not be true for any value of  $z$ . It has no solution. An equation that has no solution, or that is false for all values of the variable, is called a **contradiction**.

## Contradiction

An equation that is false for all values of the variable is called a contradiction.

A contradiction has no solution.

### Example 3.4.9

Classify the equation as a conditional equation, an identity, or a contradiction. Then state the solution.

$$6(2n - 1) + 3 = 2n - 8 + 5(2n + 1)$$

**Solution**

**Step 1: Distribute.**

$$\begin{array}{l} 12n - 6 + 3 = 2n - 8 + 10n + 5 \\ \text{Combine like terms.} \quad 12n - 3 = 12n - 3 \end{array}$$

**Step 2: Subtract  $12n$  to get the  $n$ 's to one side.**

$$\begin{array}{l} 12n - 12n - 3 = 12n - 12n - 3 \\ \text{Simplify.} \quad -3 = -3 \end{array}$$

This is a true statement.

The equation is an identity.  
The solution is all real numbers.

### Try It

22) Classify the equation as a conditional equation, an identity, or a contradiction, and then state the solution:

$$4 + 9(3x - 7) = -42x - 13 + 23(3x - 2)$$

**Solution**

identity; all real numbers

23) Classify the equation as a conditional equation, an identity, or a contradiction and then state the solution:

$$8(1 - 3x) + 15(2x + 7) = 2(x + 50) + 4(x + 3) + 1$$

**Solution**

identity; all real numbers

### Example 3.4.10

Classify as a conditional equation, an identity, or a contradiction. Then state the solution.

$$10 + 4(p - 5) = 0$$

**Solution**

**Step 1: Distribute.**

$$\begin{array}{l} \text{Combine like terms.} \end{array} \quad \begin{array}{l} 10 + 4p - 20 = 0 \\ 4p - 10 = 0 \end{array}$$

**Step 2: Add 10 to both sides.**

$$\begin{array}{l} \text{Simplify.} \end{array} \quad \begin{array}{l} 4p - 10 + 10 = 0 + 10 \\ 4p = 10 \end{array}$$

**Step 3: Divide.**

$$\begin{array}{l} \text{Simplify.} \end{array} \quad \begin{array}{l} \frac{4p}{4} = \frac{10}{4} \\ p = \frac{5}{2} \end{array}$$

The equation is true when  $p = \frac{5}{2}$ .

This is a conditional equation.

The solution is  $p = \frac{5}{2}$ .

## Try It

24) Classify the equation as a conditional equation, an identity, or a contradiction and then state the solution:  $11(q + 3) - 5 = 19$

**Solution**

conditional equation;  $q = \frac{9}{11}$

25) Classify the equation as a conditional equation, an identity, or a contradiction and then state the solution:  $6 + 14(k - 8) = 95$

**Solution**

conditional equation;  $k = \frac{193}{14}$

## Example 3.4.11

Classify the equation as a conditional equation, an identity, or a contradiction. Then state the solution.

$$5m + 3(9 + 3m) = 2(7m - 11)$$

**Solution**

**Step 1: Distribute.**

$$5m + 27 + 9m = 14m - 22$$

Combine like terms.

$$14m + 27 = 14m - 22$$

**Step 2: Subtract  $14m$  from both sides.**

$$14m + 27 - 14m = 14m - 22 - 14m$$

Simplify.

$$27 \neq -22$$

But  $27 \neq -22$ .

The equation is a contradiction.

It has no solution.

**Try It**

26) Classify the equation as a conditional equation, an identity, or a contradiction and then state the solution:

$$5m + 3(9 + 3m) = 2(7m - 11)$$

**Solution**

contradiction; no solution

27) Classify the equation as a conditional equation, an identity, or a contradiction and then state the solution:

$$4(7d + 18) = 13(3d - 2) - 11d$$

**Solution**

contradiction; no solution

Type of equation	What happens when you solve it?	Solution
<b>Conditional Equation</b>	True for one or more values of the variables and false for all other values	One or more values
<b>Identity</b>	<b>True</b> for any value of the variable	All real numbers
<b>Contradiction</b>	<b>False</b> for all values of the variable	No solution

## Key Concepts

### • General Strategy for Solving Linear Equations

1. Simplify each side of the equation as much as possible.  
Use the Distributive Property to remove any parentheses.  
Combine like terms.
2. Collect all the variable terms on one side of the equation.  
Use the Addition or Subtraction Property of Equality.
3. Collect all the constant terms on the other side of the equation.  
Use the Addition or Subtraction Property of Equality.
4. Make the coefficient of the variable term to equal to 1.  
Use the Multiplication or Division Property of Equality.  
State the solution to the equation.
5. Check the solution.  
Substitute the solution into the original equation.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objective of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=838#h5p-18>

On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

## Glossary

### **conditional equation**

An equation that is true for one or more values of the variable and false for all other values of the variable is a conditional equation.

### **contradiction**

An equation that is false for all values of the variable is called a contradiction. A contradiction has no solution.

### **identity**

An equation that is true for any value of the variable is called an identity. The solution of an identity is all real numbers.

## 3.5 SOLVE EQUATIONS WITH FRACTIONS OR DECIMALS

---

### Learning Objectives

By the end of this section, you will be able to:

- Solve equations with fraction coefficients
- Solve equations with decimal coefficients

Before you get started, take this readiness quiz:

## Try It

- 1) Multiply:  $8 \times \frac{3}{8}$
- 2) Find the LCD of  $\frac{5}{6}$  and  $\frac{1}{4}$
- 3) Multiply 4.78 by 100

## Solve Equations with Fraction Coefficients

Let's use the general strategy for solving linear equations introduced earlier to solve the equation,  
 $\frac{1}{8}x + \frac{1}{2} = \frac{1}{4}$ .

To isolate the  $x$  term, subtract  $\frac{1}{2}$  from both sides.

Simplify the left side.

Change the constants to equivalent fractions with the LCD.

Subtract.

Multiply both sides by the reciprocal of  $\frac{1}{8}$

Simplify.

This method worked fine, but many students do not feel very confident when they see all those fractions. So, we are going to show an alternate method to solve equations with fractions. This alternate method eliminates the fractions.

We will apply the *Multiplication Property of Equality* and multiply both sides of an equation by the least

$$\begin{aligned}
 \frac{1}{8}x + \frac{1}{2} &= \frac{1}{4} \\
 \frac{1}{8}x + \frac{1}{2} - \frac{1}{2} &= \frac{1}{4} - \frac{1}{2} \\
 \frac{1}{8}x &= \frac{1}{4} - \frac{1}{2} \\
 \frac{1}{8}x &= \frac{1}{4} - \frac{2}{4} \\
 \frac{1}{8}x &= -\frac{1}{4} \\
 \frac{8}{1} \cdot \frac{1}{8}x &= \frac{8}{1} \left( -\frac{1}{4} \right) \\
 x &= -2
 \end{aligned}$$

common denominator of all the fractions in the equation. The result of this operation will be a new equation, equivalent to the first, but without fractions. This process is called “clearing” the equation of fractions.

Let’s solve a similar equation, but this time use the method that eliminates the fractions.

### Example 3.5.1

Solve:  $\frac{1}{6}y - \frac{1}{3} = \frac{5}{6}$

#### Solution

**Step 1: Find the least common denominator of *all* the fractions in the equation.**

What is the LCD of  $\frac{1}{6}$ ,  $\frac{1}{3}$ , and  $\frac{5}{6}$ ?

$$\frac{1}{6}y - \frac{1}{3} = \frac{5}{6} \quad LCD = 6$$

**Step 2: Multiply both sides of the equation by that LCD. This clears the fractions.**

Multiply both sides of the equation by the LCD 6.  $6\left(\frac{1}{6}y - \frac{1}{3}\right) = 6\left(\frac{5}{6}\right)$

Use the Distributive Property.

$$6 \cdot \frac{1}{6}y - 6 \cdot \frac{1}{3} = 6 \cdot \frac{5}{6}$$

Simplify - and notice, no more fractions!

$$y - 2 = 5$$

**Step 3: Solve using the General Strategy for Solving Linear Equations.**

To isolate the “y” term, add 2.

$$y - 2 + 2 = 5 + 2$$

Simplify.

$$y = 7$$

## Try It

4) Solve:  $\frac{1}{4}x + \frac{1}{2} = \frac{5}{8}$

**Solution**

$$x = \frac{1}{2}$$

5) Solve:  $\frac{1}{8}x + \frac{1}{2} = \frac{1}{4}$

**Solution**

$$x = -2$$

Notice in Example 3.5.1, once we cleared the equation of fractions, the equation was like those we solved earlier in this chapter. We changed the problem to one we already knew how to solve! We then used the *General Strategy for Solving Linear Equations*.

## HOW TO

### Strategy to solve equations with fraction coefficients.

1. Find the least common denominator of *all* the fractions in the equation.
2. Multiply both sides of the equation by that LCD. This clears the fractions.
3. Solve using the General Strategy for Solving Linear Equations.

**Example 3.5.2**

Solve:  $6 = \frac{1}{2}v + \frac{2}{5}v - \frac{3}{4}v$

**Solution**

We want to clear the fractions by multiplying both sides of the equation by the LCD of all the fractions in the equation.

**Step 1: Find the LCD of all fractions in the equation.**

$$6 = \frac{1}{2}v + \frac{2}{5}v - \frac{3}{4}v$$

**Step 2: The LCD is 20.**

**Step 3: Multiply both sides of the equation by 20.**

$$20(6) = 20 \cdot \left( \frac{1}{2}v + \frac{2}{5}v - \frac{3}{4}v \right)$$

**Step 4: Distribute.**

$$20(6) = 20 \cdot \frac{1}{2}v + 20 \cdot \frac{2}{5}v - 20 \cdot \frac{3}{4}v$$

Simplify - notice, no more fractions!  $120 = 10v + 8v - 15v$

**Step 5: Combine like terms.**

$$120 = 3v$$

**Step 6: Divide by 3.**

$$\frac{120}{3} = \frac{3v}{3}$$

Simplify.  $40 = v$

**Step 7: Check:**

$$6 = \frac{1}{2}v + \frac{2}{5}v - \frac{3}{4}v$$

**Step 8: Let  $v = 40$ .**

$$\begin{aligned}
 6 &\stackrel{?}{=} \frac{1}{2}(\textcolor{red}{40}) + \frac{2}{5}(\textcolor{red}{40}) - \frac{3}{4}(\textcolor{red}{40}) \\
 6 &\stackrel{?}{=} 20 + 16 - 30 \\
 6 &= 6\checkmark
 \end{aligned}$$

### Try It

6) Solve:  $7 = \frac{1}{2}x + \frac{3}{4}x - \frac{2}{3}x$

**Solution**

$$x = 12$$

7) Solve:  $-1 = \frac{1}{2}u + \frac{1}{4}u - \frac{2}{3}u$

**Solution**

$$u = -12$$

In the next example, we again have variables on both sides of the equation.

### Example 3.5.3

Solve:  $a + \frac{3}{4} = \frac{3}{8}a - \frac{1}{2}$

**Solution**

**Step 1: Find the LCD of all fractions in the equation.**

The LCD is 8.

**Step 2: Multiply both sides by the LCD.**

$$8\left(a + \frac{3}{4}\right) = 8\left(\frac{3}{8}a - \frac{1}{2}\right)$$

**Step 3: Distribute.**

$$\begin{aligned} 8 \cdot a + 8 \cdot \frac{3}{4} &= 8 \cdot \frac{3}{8}a - 8 \cdot \frac{1}{2} \\ \text{Simplify - no more fractions.} & \quad 8a + 6 = 3a - 4 \end{aligned}$$

**Step 4: Subtract  $3a$  from both sides.**

$$\begin{aligned} 8a - 3a + 6 &= 3a - 3a - 4 \\ \text{Simplify.} \quad 5a + 6 &= -4 \end{aligned}$$

**Step 5: Subtract 6 from both sides.**

$$\begin{aligned} 5a + 6 - 6 &= -4 - 6 \\ \text{Simplify.} \quad 5a &= -10 \end{aligned}$$

**Step 6: Divide by 5.**

$$\begin{aligned} \frac{5a}{5} &= \frac{-10}{5} \\ \text{Simplify.} \quad a &= -2 \end{aligned}$$

**Step 7: Check:**

$$a + \frac{3}{4} = \frac{3}{8}a - \frac{1}{2}$$

**Step 8: Let  $a = -2$ .**

$$\begin{aligned} -2 + \frac{3}{4} &\stackrel{?}{=} \frac{3}{8}(-2) - \frac{1}{2} \\ -\frac{8}{4} + \frac{3}{4} &\stackrel{?}{=} -\frac{16}{8} - \frac{4}{8} \\ -\frac{5}{4} &= -\frac{10}{8} \\ -\frac{5}{4} &= -\frac{5}{4} \checkmark \end{aligned}$$

## Try It

8) Solve:  $x + \frac{1}{3} = \frac{1}{6}x - \frac{1}{2}$

**Solution**

$$x = -1$$

9) Solve:  $c + \frac{3}{4} = \frac{1}{2}c - \frac{1}{4}$

**Solution**

$$c = -2$$

In the next example, we start by using the *Distributive Property*. This step clears the fractions right away.

## Example 3.5.4

Solve:  $-5 = \frac{1}{4}(8x + 4)$

**Solution**

**Step 1: Distribute.**

$$-5 = \frac{1}{4} \cdot 8x + \frac{1}{4} \cdot 4$$

Simplify.

$$-5 = 2x + 1$$

Now there are no fractions.

**Step 2: Subtract 1 from both sides.**

$$\begin{array}{l} -5 - 1 = 2 + 1 - 1 \\ \text{Simplify.} \quad -6 = 2x \end{array}$$

**Step 3: Divide by 2.**

$$\begin{array}{l} \frac{-6}{2} = \frac{2x}{2} \\ \text{Simplify.} \quad -3 = x \end{array}$$

**Step 4: Check:**

$$-5 = \frac{1}{4}(8x + 4)$$

**Step 5: Let  $x = -3$ .**

$$\begin{array}{l} -5 \stackrel{?}{=} \frac{1}{2}(4(-3) + 2) \\ -5 \stackrel{?}{=} \frac{1}{2}(-12 + 2) \\ -5 \stackrel{?}{=} \frac{1}{2}(-10) \\ -5 = -5 \checkmark \end{array}$$

## Try It

10) Solve:  $-11 = \frac{1}{2}(6p + 2)$

**Solution**

$$p = -4$$

11) Solve:  $8 = \frac{1}{3}(9q + 6)$

**Solution**

$$q = 2$$

In the next example, even after distributing, we still have fractions to clear.

### Example 3.5.5

Solve:  $\frac{1}{2}(y - 5) = \frac{1}{4}(y - 1)$

**Solution**

**Step 1: Distribute.**

$$\begin{aligned} \frac{1}{2} \cdot y - \frac{1}{2} \cdot 5 &= \frac{1}{4} \cdot y - \frac{1}{4} \cdot 1 \\ \text{Simplify.} \quad \frac{1}{2}y - \frac{5}{2} &= \frac{1}{4}y - \frac{1}{4} \end{aligned}$$

**Step 2: Multiply by the LCD, 4.**

$$\begin{aligned} 4 \left( \frac{1}{2}y - \frac{5}{2} \right) &= 4 \left( \frac{1}{4}y - \frac{1}{4} \right) \\ \text{Distribute.} \quad 4 \cdot \frac{1}{2}y - 4 \cdot \frac{5}{2} &= 4 \cdot \frac{1}{4}y - 4 \cdot \frac{1}{4} \\ \text{Simplify.} \quad 2y - 10 &= y - 1 \end{aligned}$$

**Step 3: Collect the variables to the left.**

$$\begin{aligned} 2y - y - 10 &= y - y - 1 \\ \text{Simplify.} \quad y - 10 &= -1 \end{aligned}$$

**Step 4: Collect the constants to the right.**

$$\begin{aligned} y - 10 + 10 &= -1 + 10 \\ \text{Simplify.} \quad y &= 9 \end{aligned}$$

**Step 5: Check:**

$$\frac{1}{2}(y - 5) = \frac{1}{4}(y - 1)$$

**Step 6: Let  $y = 9$ .**

$$\frac{1}{2}(9 - 5) \stackrel{?}{=} \frac{1}{4}(9 - 1)$$

Finish the check on your own.

## Try It

12) Solve:  $\frac{1}{5}(n + 3) = \frac{1}{4}(n + 2)$

**Solution**

$$n = 2$$

13) Solve:  $\frac{1}{2}(m - 3) = \frac{1}{4}(m - 7)$

**Solution**

$$m = -1$$

## Example 3.5.6

Solve:  $\frac{5x - 3}{4} = \frac{x}{2}$

**Solution**

**Step 1: Multiply by the LCD, 4.**

$$\begin{array}{l} \text{Simplify.} \qquad 4 \left( \frac{5x - 3}{4} \right) = 4 \left( \frac{x}{2} \right) \\ \qquad \qquad \qquad 5x - 3 = 2x \end{array}$$

**Step 2: Collect the variables to the right.**

$$\begin{array}{rcl} 5x - 5x - 3 & = & 2x - 5x \\ \text{Simplify.} & & -3 = -3x \end{array}$$

**Step 3: Divide.**

$$\begin{array}{rcl} \frac{-3}{-3} & = & \frac{-3x}{-3} \\ \text{Simplify.} & & 1 = x \end{array}$$

**Step 4: Check:**

$$\frac{5x - 3}{4} = \frac{x}{2}$$

**Step 5: Let  $x = 1$ .**

$$\begin{array}{rcl} \frac{5(1) - 3}{4} & \stackrel{?}{=} & \frac{1}{2} \\ \frac{2}{4} & \stackrel{?}{=} & \frac{1}{2} \\ \frac{1}{2} & = & \frac{1}{2} \checkmark \end{array}$$

## Try It

14) Solve:  $\frac{4y - 7}{3} = \frac{y}{6}$

**Solution**

$$y = 2$$

15) Solve:  $\frac{-2z - 5}{4} = \frac{z}{8}$

**Solution**

$$z = -2$$

### Example 3.5.7

Solve:  $\frac{a}{6} + 2 = \frac{a}{4} + 3$

**Solution**

**Step 1: Multiply by the LCD, 12.**

$$12\left(\frac{a}{6} + 2\right) = 12\left(\frac{a}{4} + 3\right)$$

**Step 2: Distribute.**

$$12 \cdot \frac{a}{6} + 12 \cdot 2 = 12 \cdot \frac{a}{4} + 12 \cdot 3$$

Simplify.  $2a + 24 = 3a + 36$

**Step 3: Collect the variables to the right.**

$$2a - 2a + 24 = 3a - 2a + 36$$

Simplify.  $24 = a + 36$

**Step 4: Collect the constants to the left.**

$$24 - 36 = a + 36 - 36$$

Simplify.  $a = -12$

**Step 5: Check:**

$$\frac{a}{6} + 2 = \frac{a}{4} + 3$$

**Step 6: Let  $a = -12$ .**

$$\begin{aligned}\frac{-12}{6} + 2 &\stackrel{?}{=} \frac{-12}{4} + 3 \\ -2 + 2 &\stackrel{?}{=} -3 + 3 \\ 0 &= 0 \checkmark\end{aligned}$$

## Try It

16) Solve:  $\frac{b}{10} + 2 = \frac{b}{4} + 5$

**Solution**

$$b = -20$$

17) Solve:  $\frac{c}{6} + 3 = \frac{c}{3} + 4$

**Solution**

$$c = -6$$

## Example 3.5.8

Solve:  $\frac{4q + 3}{2} + 6 = \frac{3q + 5}{4}$

**Solution**

**Step 1:** Multiply by the LCD, 4.

$$4\left(\frac{4q+3}{2} + 6\right) = 4\left(\frac{3q+5}{4}\right)$$

**Step 2: Distribute.**

$$4\left(\frac{4q+3}{2}\right) + 4 \cdot 6 = 4 \cdot \left(\frac{3q+5}{4}\right)$$

Simplify.

$$2(4q+3) + 24 = 3q+5$$

$$8q+6+24 = 3q+5$$

$$8q+30 = 3q+5$$

**Step 3: Collect the variables to the left.**

$$8q - 3q + 30 = 3q - 3q + 5$$

Simplify.

$$5q + 30 = 5$$

**Step 4: Collect the constants to the right.**

$$5q + 30 - 30 = 5 - 30$$

Simplify.

$$5q = -25$$

**Step 5: Divide by 5.**

$$\frac{5q}{5} = \frac{-25}{5}$$

Simplify.

$$q = -5$$

**Step 6: Check:**

$$\frac{4q+3}{2} + 6 = \frac{3q+5}{4}$$

**Step 7: Let  $q = -5$ .**

$$\frac{4(-5)+3}{2} + 6 \stackrel{?}{=} \frac{3(-5)+5}{4}$$

Finish the check on your own.

## Try It

18) Solve:  $\frac{3r + 5}{6} + 1 = \frac{4r + 3}{3}$

**Solution**

$$r = 1$$

19) Solve:  $\frac{2s + 3}{2} + 1 = \frac{3s + 2}{4}$

**Solution**

$$s = -8$$

## Solve Equations with Decimal Coefficients

Some equations have decimals in them. This kind of equation will occur when we solve problems dealing with money or percentages. But decimals can also be expressed as fractions. For example,  $0.3 = \frac{3}{10}$  and  $0.17 = \frac{17}{100}$ . So, with an equation with decimals, we can use the same method we used to clear fractions—multiply both sides of the equation by the least common denominator.

### Example 3.5.9

Solve:  $0.06x + 0.02 = 0.25x - 1.5$

**Solution**

Look at the decimals and think of the equivalent fractions.

$$0.06 = \frac{6}{100} \quad 0.02 = \frac{2}{100} \quad 0.25 = \frac{25}{100} \quad 1.5 = 1\frac{5}{10}$$

Notice, the LCD is 100.

By multiplying by the LCD, we will clear the decimals from the equation.

$$0.06x + 0.02 = 0.25x - 1.5$$

**Step 1: Multiply both sides by 100.**

$$100(0.06x + 0.02) = 100(0.25x - 1.5)$$

**Step 2: Distribute.**

$$100(0.06x) + 100(0.02) = 100(0.25x) - 100(1.5)$$

**Step 3: Multiply, and now we have no more decimals.**

$$6x + 2 = 25x - 150$$

**Step 4: Collect the variables to the right.**

$$6x - 6x + 2 = 25x - 6x - 150$$

Simplify.

$$2 = 19x - 150$$

**Step 5: Collect the constants to the left.**

$$2 + 150 = 19x - 150 + 150$$

Simplify.

$$152 = 19x$$

**Step 6: Divide by 19.**

$$\frac{152}{19} = \frac{19x}{19}$$

Simplify.

$$8 = x$$

**Step 7: Check: Let  $x = 8$ .**

$$0.06(8) + 0.02 \stackrel{?}{=} 0.25(8) - 1.5$$

$$0.48 + 0.02 \stackrel{?}{=} 2.00 - 1.5$$

$$0.50 = 0.50 \checkmark$$

## Try It

20) Solve:  $0.14h + 0.12 = 0.35h - 2.4$

**Solution**

$$h = 12$$

21) Solve:  $0.65k - 0.1 = 0.4k - 0.35$

**Solution**

$$k = -1$$

The next example uses an equation that is typical of the money applications in the next chapter. Notice that we distribute the decimal before we clear all the decimals.

## Example 3.5.10

Solve:  $0.25x + 0.05(x + 3) = 2.85$

**Solution**

**Step 1: Distribute first.**

$$0.25x + 0.05x + 0.15 = 2.85$$

**Step 2: Combine like terms.**

$$0.30x + 0.15 = 2.85$$

**Step 3: To clear decimals, multiply by 100.**

$$100(0.30x + 0.15) = 100(2.85)$$

**Step 4: Distribute.**

$$30x + 15 = 285$$

**Step 5: Subtract 15 from both sides.**

$$30x + 15 - 15 = 285 - 15$$

Simplify.

$$30x = 270$$

**Step 6: Divide by 30.**

$$\frac{30x}{30} = \frac{270}{30}$$

Simplify.

$$x = 9$$

**Step 7: Check it yourself by substituting  $x = 9$  into the original equation.**

## Try It

22) Solve:  $0.25n + 0.05(n + 5) = 2.95$

**Solution**

$$n = 9$$

23) Solve:  $0.10d + 0.05(d - 5) = 2.15$

**Solution**

$$d = 16$$

## Key Concepts

- **Strategy to Solve an Equation with Fraction Coefficients**

1. Find the least common denominator of all the fractions in the equation.
2. Multiply both sides of the equation by that LCD. This clears the fractions.
3. Solve using the General Strategy for Solving Linear Equations.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=958#h5p-19>

Overall, after looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

## 3.6 SOLVE A FORMULA FOR A SPECIFIC VARIABLE

---

### Learning Objectives

By the end of this section, you will be able to:

- Use the Distance, Rate, and Time formula
- Solve a formula for a specific variable

### Try It

Before you get started, take this readiness quiz:

1) Solve:  $15t = 120$

2) Solve:  $6x + 24 = 96$

### Use the Distance, Rate, and Time Formula

One formula you will use often in algebra and in everyday life is the formula for distance travelled by an object moving at a constant rate. Rate is an equivalent word for “speed.” The basic idea of rate may already be familiar to you. Do you know what distance you travel if you drive at a steady rate of **60** miles per hour for **2** hours?

(This might happen if you use your car's cruise control while driving on the highway.) If you said 120 miles, you already know how to use this formula!

For an object moving at a uniform (constant) rate, the distance travelled, the elapsed time, and the rate are related by the formula:

$$d = rt, \text{ when}$$

$$d = \text{distance}$$

$$r = \text{rate}$$

$$t = \text{time}$$

We will use the *Strategy for Solving Applications* that we used earlier in this chapter. When our problem requires a formula, we change Step 4: In place of writing a sentence, we write the appropriate formula. We write the revised steps here for reference.

## HOW TO

### Solve an application (with a formula).

1. Read the problem. Make sure all the words and ideas are understood.
2. Identify what we are looking for.
3. Name what we are looking for. Choose a variable to represent that quantity.
4. Translate into an equation. Write the appropriate formula for the situation. Substitute in the given information.
5. Solve the equation using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

You may want to create a mini-chart to summarize the information in the problem. See the chart in this first example.

### Example 3.6.1

Jamal rides his bike at a uniform rate of **12** miles per hour for  $3\frac{1}{2}$  hours. What distance has he travelled?

#### **Solution**

**Step 1: Read the problem.**

**Step 2: Identify what you are looking for.**

distance travelled

**Step 3: Name. Choose a variable to represent it.**

Let  $d$  = distance.

**Step 4: Translate: Write the appropriate formula.**

$$d = rt$$

$$d = ?$$

$$r = 12 \text{ mph}$$

$$t = 3\frac{1}{2} \text{ hours}$$

**Step 5: Substitute in the given information.**

$$d = 12 \cdot 3\frac{1}{2}$$

**Step 6: Solve the equation.**

$$d = 42 \text{ miles}$$

**Step 7: Check**

Does 42 miles make sense?

Jamal rides:

12 miles in 1 hour,  
 24 miles in 2 hours,  
 36 miles in 3 hours, 42 miles in  $3\frac{1}{2}$  hours is reasonable  
 48 miles in 4 hours.

Figure 3.6.1

**Step 8: Answer the question with a complete sentence.**

Jamal rode 42 miles.

## Try It

3) Lindsay drove for  $5\frac{1}{2}$  hours at 60 miles per hour. How much distance did she travel?

**Solution**

330 miles

4) Trinh walked for  $2\frac{1}{3}$  hours at 3 miles per hour. How far did she walk?

**Solution**

7 miles

## Example 3.6.2

Rey is planning to drive from his house in San Diego to visit his grandmother in Sacramento, a distance of **520** miles. If he can drive at a steady rate of **65** miles per hour, how many hours will the trip take?

### Solution

**Step 1: Read the problem.**

**Step 2: Identify what you are looking for.**

How many hours (time)

**Step 3: Name.**

Choose a variable to represent it.

Let  $t$  = time.

$$d = 520 \text{ miles}$$

$$r = 65 \text{ mph}$$

$$t = ? \text{ hours}$$

**Step 4: Translate.**

Write the appropriate formula. Substitute in the given information.

$$d = rt$$

$$520 = 65t$$

$$t = 8$$

**Step 5: Solve the equation.**

$$t = 8$$

**Step 6: Check.**

Substitute the numbers into the formula and make sure the result is a true statement.

$$d = rt$$

$$520 \stackrel{?}{=} 65 \times 8$$

$$520 = 520 \checkmark$$

**Step 7: Answer the question with a complete sentence.**

Rey's trip will take 8 hours.

## Try It

5) Lee wants to drive from Phoenix to his brother's apartment in San Francisco, a distance of 770 miles. If he drives at a steady rate of 70 miles per hour, how many hours will the trip take?

### Solution

11 hours

6) Yesenia is 168 miles from Chicago. If she needs to be in Chicago in 3 hours, at what rate does she need to drive?

### Solution

56 mph

## Solve a Formula for a Specific Variable

You are probably familiar with some geometry formulas. A formula is a mathematical description of the relationship between variables. Formulas are also used in the sciences, such as chemistry, physics, and biology. In medicine, they are used for calculations for dispensing medicine or determining body mass index. Spreadsheet programs rely on formulas to make calculations. It is important to be familiar with formulas and be able to manipulate them easily.

In Example 3.6.1 and Example 3.6.2, we used the formula  $d = rt$ . This formula gives the value of  $d$ , distance, when you substitute in the values of  $r$  and  $t$ , the rate and time. But in Example 3.6.2 we had to find the value of  $t$ . We substituted in values of  $d$  and  $r$  and then used algebra to solve for  $t$ . If you had to do this often, you might wonder why there is not a formula that gives the value of  $t$  when you substitute in the values of  $d$  and  $r$ . We can make a formula like this by solving the formula  $d = rt$  for  $t$ .

To solve a formula for a specific variable means to isolate that variable on one side of the equals sign with a coefficient of 1. All other variables and constants are on the other side of the equals sign. To see how to solve a formula for a specific variable, we will start with the distance, rate and time formula.

### Example 3.6.3

Solve the formula  $d = rt$  for  $t$ :

- a. when  $d = 520$  and  $r = 65$
- b. in general

**Solution**

We will write the solutions side-by-side to demonstrate that solving a formula in general uses the same steps as when we have numbers to substitute.

a. when $d = 520$ and $r = 65$		b. in general	
<i>Step 1: Write the formula.</i>	$d = rt$	<i>Step 1: Write the formula.</i>	$d = rt$
<i>Step 2: Substitute.</i>	$520 = 65t$		
<i>Step 3: Divide, to isolate <math>t</math>.</i>	$\frac{520}{65} = \frac{65t}{65}$	<i>Step 2: Divide, to isolate <math>t</math>.</i>	$\frac{d}{r} = \frac{rt}{r}$
<i>Step 4: Simplify.</i>	$8 = t$	<i>Step 3: Simplify.</i>	$\frac{d}{r} = t$

We say the formula  $t = \frac{d}{r}$  is solved for  $t$ .

### Try It

7) Solve the formula  $d = rt$  for  $r$

a. when  $d = 180$  and  $t = 4$

b. in general

**Solution**

a.  $r = 45$

b.  $r = \frac{d}{t}$

8) Solve the formula  $d = rt$  for  $r$

a. when  $d = 780$  and  $t = 12$

b. in general

**Solution**

a.  $r = 65$

b.  $r = \frac{d}{t}$

### Example 3.6.4

Solve the formula  $A = \frac{1}{2}bh$  for  $h$ :

a. when  $A = 90$  and  $b = 15$

b. in general

**Solution**

a. when $A = 90$ and $b = 15$		b. in general	
<i>Step 1: Write the formula.</i>	$A = \frac{1}{2}bh$	<i>Step 1: Write the formula.</i>	$A = \frac{1}{2}bh$
<i>Step 2: Substitute.</i>	$90 = \frac{1}{2} \cdot 15 \cdot h$		
<i>Step 3: Clear the fractions.</i>	$2 \cdot 90 = 2 \cdot \frac{1}{2} 15h$	<i>Step 2: Clear the fractions.</i>	$2 \cdot A = 2 \cdot \frac{1}{2} bh$
<i>Step 4: Simplify.</i>	$180 = 15h$	<i>Step 3: Simplify.</i>	$2A = bh$
<i>Step 5: Solve for <math>h</math>.</i>	$12 = h$	<i>Step 4: Solve for <math>h</math>.</i>	$\frac{2A}{b} = h$

We can now find the height of a triangle, if we know the area and the base, by using the formula

$$h = \frac{2A}{b}$$

## Try It

9) Use the formula  $A = \frac{1}{2}bh$  to solve for  $h$

a. when  $A = 170$  and  $b = 17$

b. in general

### Solution

a.  $h = 20$

b.  $h = \frac{2A}{b}$

10) Use the formula  $A = \frac{1}{2}bh$  to solve for  $b$

a. when  $A = 62$  and  $h = 31$

b. in general

**Solution**

a.  $b = 4$

b.  $b = \frac{2A}{h}$

The formula  $I = Prt$  is used to calculate simple interest,  $I$ , for a principal,  $P$ , invested at rate,  $r$ , for  $t$  years.

### Example 3.6.5

Solve the formula  $I = Prt$  to find the principal,  $P$ :

a. when  $I = \$5,600$ ,  $r = 4\%$ ,  $t = 7 \text{ years}$

b. in general

**Solution**

a. \$5,600, $r = 4\%$ , $t = 7\text{years}$		b. in general	
Step 1: Write the formula.	$I = Prt$	Step 1: Write the formula.	$I = Prt$
Step 2: Substitute.	$5600 = P(0.04)(7)$		
Step 3: Simplify.	$5600 = P(0.28)$	Step 2: Simplify.	$I = P(rt)$
Step 4: Divide, to isolate $P$ .	$\frac{5600}{0.28} = \frac{P(0.28)}{0.28}$	Step 3: Divide, to isolate $P$ .	$\frac{I}{rt} = \frac{P(rt)}{rt}$
Step 5: Simplify.	$20,000 = P$	Step 4: Simplify.	$\frac{I}{rt} = P$
The principal is	\$20,000		$P = \frac{I}{rt}$

## Try It

11) Use the formula  $I = Prt$  to find the principal,  $P$ :

a. when  $I = \$2,160$ ,  $r = 6\%$ ,  $t = 3\text{years}$

b. in general

### Solution

a. \$12,000

b.  $P = \frac{I}{rt}$

12) Use the formula  $I = Prt$  to find the principal,  $P$ :

a. when  $I = \$5,400$ ,  $r = 12\%$ ,  $t = 5\text{ years}$

b. in general

**Solution**

a. \$9,000

b.  $P = \frac{I}{rt}$

Later in this class, and in future algebra classes, you'll encounter equations that relate two variables, usually  $x$  and  $y$ . You might be given an equation that is solved for  $y$  and need to solve it for  $x$ , or vice versa. In the following example, we're given an equation with both  $x$  and  $y$  on the same side and we'll solve it for  $y$ .

**Example 3.6.6**

Solve the formula  $3x + 2y = 18$  for  $y$ :

a. when  $x = 4$

b. in general

**Solution**

a. when $x = 4$		b. in general	
<i>Step 1: Substitute.</i>	$3(4) + 2y = 18$		
<i>Step 2: Subtract to isolate the <math>y</math>-term.</i>	$12 - 12 + 2y = 18 - 12$	<i>Step 1: Subtract to isolate the <math>y</math>-term.</i>	$3x - 3x + 2y = 18 - 3x$
<i>Step 3: Divide.</i>	$\frac{2y}{2} = \frac{6}{2}$	<i>Step 2: Divide.</i>	$\frac{2y}{2} = \frac{18}{2} - \frac{3x}{2}$
<i>Step 4: Simplify.</i>	$y = 3$	<i>Step 3: Simplify.</i>	$y = -\frac{3x}{2} + 9$

## Try It

13) Solve the formula  $3x + 4y = 10$  for  $y$ :

a. when  $x = \frac{14}{3}$

b. in general

### Solution

a.  $y = 1$

b.  $y = \frac{10 - 3x}{4}$

14) Solve the formula  $5x + 2y = 18$  for  $y$ :

a. when  $x = 4$

b. in general

### Solution

a.  $y = -1$

b.  $y = \frac{18 - 5x}{2}$

In Examples 3.6.3 through 3.6.6 we used the numbers in part a. as a guide to solving in general in part b. Now we will solve a formula in general without using numbers as a guide.

## Example 3.6.7

Solve the formula  $P = a + b + c$  for  $a$

### Solution

**Step 1:** We will isolate  $a$  on one side of the equation.

$$P = a + b + c$$

**Step 2:** Both  $b$  and  $c$  are added to  $a$ , so we subtract them from both sides of the equation.

$$P - b - c = a + b + c - b - c$$

**Step 3:** Simplify.

$$\begin{aligned} P - b - c &= a \\ a &= P - b - c \end{aligned}$$

## Try It

15) Solve the formula  $P = a + b + c$  for  $b$

**Solution**

$$b = P - a - c$$

16) Solve the formula  $P = a + b + c$  for  $c$

**Solution**

$$c = P - a - b$$

## Example 3.6.8

Solve the formula  $6x + 5y = 13$  for  $y$

**Solution****Step 1: Subtract  $6x$  from both sides to isolate the term with  $y$** 

$$6x - 6x + 5y = 13 - 6x$$

Simplify.

$$5y = 13 - 6x$$

**Step 2: Divide by 5 to make the coefficient 1.**

$$\frac{5y}{5} = \frac{13 - 6x}{5}$$

Simplify.

$$y = \frac{13 - 6x}{5}$$

The fraction is simplified. We cannot divide  $13 - 6x$  by 5.**Try It**17) Solve the formula  $4x + 7y = 9$  for  $y$ .**Solution**

$$y = \frac{9 - 4x}{7}$$

18) Solve the formula  $5x + 8y = 1$  for  $y$ .**Solution**

$$y = \frac{1 - 5x}{8}$$

In the next example, we will solve this formula for the height.

### Example 3.6.9

Solve the formula  $V = \frac{1}{3}\pi r^2 h$  for  $h$ .

#### Solution

**Step 1: Write the formula.**

$$V = \frac{1}{3}\pi r^2 h$$

**Step 2: Remove the fraction on the right.**

$$3 \cdot V = 3 \cdot \frac{1}{3}\pi r^2 h$$

Simplify.  $3V = \pi r^2 h$

**Step 4: Divide both sides by  $\pi r^2$**

$$\frac{3V}{\pi r^2} = h$$

We could now use this formula to find the height of a right circular cone when we know the volume and the radius of the base, by using the formula  $h = \frac{3V}{\pi r^2}$ .

### Try It

19) Use the formula  $A = \frac{1}{2}bh$  to solve for  $b$ .

#### Solution

$$b = \frac{2A}{h}$$

20) Use the formula  $A = \frac{1}{2}bh$  to solve for  $h$ .

**Solution**

$$h = \frac{2A}{b}$$

In the sciences, we often need to change temperature from Fahrenheit to Celsius or vice versa. If you travel in a foreign country, you may want to change the Celsius temperature to the more familiar Fahrenheit temperature.

### Example 3.6.10

Solve the formula  $C = \frac{5}{9}(F - 32)$  for  $F$ .

**Solution**

**Step 1: Write the formula.**

$$C = \frac{5}{9}(F - 32)$$

**Step 2: Remove the fraction on the right.**

$$\begin{aligned} \frac{9}{5}C &= \frac{9}{5} \cdot \frac{5}{9}(F - 32) \\ \text{Simplify.} \quad \frac{9}{5}C &= (F - 32) \end{aligned}$$

**Step 4: Add 32 to both sides.**

$$\frac{9}{5}C + 32 = F$$

We can now use the formula  $F = \frac{9}{5}C + 32$  to find the Fahrenheit temperature when we know the Celsius temperature.

## Try It

21) Solve the formula  $F = \frac{9}{5}C + 32$  for  $C$ .

**Solution**

$$C = \frac{5}{9}(F - 32)$$

22) Solve the formula  $A = \frac{1}{2}h(b + B)$  for  $b$ .

**Solution**

$$b = \frac{2A - Bh}{h}$$

The next example uses the formula for the surface area of a right cylinder.

## Example 3.6.11

Solve the formula  $S = 2\pi r^2 + 2\pi rh$  for  $h$ .

**Solution**

**Step 1: Write the formula.**

$$S = 2\pi r^2 + 2\pi rh$$

**Step 2: Isolate the  $h$  term by subtracting  $2\pi r^2$  from each side.**

$$S - 2\pi r^2 = 2\pi r^2 - 2\pi r^2 + 2\pi rh$$

Simplify.  $S - 2\pi r^2 = 2\pi rh$

**Step 3: Solve for  $h$  by dividing both sides by  $2\pi r$**

$$\frac{S - 2\pi r^2}{2\pi r} = \frac{2\pi rh}{2\pi r}$$

Simplify.  $\frac{S - 2\pi r^2}{2\pi r} = h$

## Try It

23) Solve the formula  $A = P + Prt$  for  $t$ .

**Solution**

$$t = \frac{A - P}{Pr}$$

24) Solve the formula  $A = P + Prt$  for  $r$ .

**Solution**

$$r = \frac{A - P}{Pt}$$

## Key Concepts

- **To Solve an Application (with a formula)**

1. Read the problem. Make sure all the words and ideas are understood.
2. Identify what we are looking for.
3. Name what we are looking for. Choose a variable to represent that quantity.
4. Translate into an equation. Write the appropriate formula for the situation. Substitute in the given information.
5. Solve the equation using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

- **Distance, Rate and Time**

For an object moving at a uniform (constant) rate, the distance travelled, the elapsed time, and the rate are related by the formula:  $d = rt$  where  $d = \text{distance}$ ,  $r = \text{rate}$ ,  $t = \text{time}$ .

- **To solve a formula for a specific variable** means to get that variable by itself with a coefficient of **1** on one side of the equation and all other variables and constants on the other side.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=1002#h5p-20>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## 3.7 USE A PROBLEM-SOLVING STRATEGY AND APPLICATIONS

---

### Learning Objectives

By the end of this section, you will be able to:

- Approach word problems with a positive attitude
- Use a problem-solving strategy for word problems
- Solve number problems
- Translate and solve basic percent equations
- Solve percent applications
- Find percent increase and percent decrease
- Solve simple interest applications
- Solve applications with discount or mark-up

### Try It

Before you get started, take this readiness quiz:

- 1) Translate “6 less than twice  $x$ ” into an algebraic expression.
- 2) Solve:  $\frac{2}{3}x = 24$

- 3) Solve:  $3x + 8 = 14$
- 4) Convert  $4.5\%$  to a decimal.
- 5) Convert  $0.6$  to a percent.
- 6) Round  $0.875$  to the nearest hundredth.
- 7) Multiply  $(4.5)(2.38)$
- 8) Solve  $3.5 = 0.7n$
- 9) Subtract  $50 - 37.45$

## Approach Word Problems with a Positive Attitude

“If you think you can... or think you can’t... you’re right.” —Henry Ford

The world is full of word problems! Will my income qualify me to rent that apartment? How much punch do I need to make for the party? What size diamond can I afford to buy my girlfriend? Should I fly or drive to my family reunion?

How much money do I need to fill the car with gas? How much tip should I leave at a restaurant? How many socks should I pack for vacation? What size turkey do I need to buy for Thanksgiving dinner, and then what time do I need to put it in the oven? If my sister and I buy our mother a present, how much does each of us pay?

Now that we can solve equations, we are ready to apply our new skills to word problems. Do you know anyone who has had negative experiences in the past with word problems? Have you ever had thoughts like the student below?

Negative thoughts can be barriers to success.

Figure 3.7.1 Negative thoughts can be barriers to success.

When we feel we have no control, and continue repeating negative thoughts, we set up barriers to success. We need to calm our fears and change our negative feelings.

Start with a fresh slate and begin to think positive thoughts. If we take control and believe we can be successful, we will be able to master word problems! Read the positive thoughts in Figure 3.7.2 and say them out loud.

Thinking positive thoughts is a first step towards success.

Figure 3.7.2 Thinking positive thoughts is a first step towards success.

Think of something, outside of school, that you can do now but couldn't do 3 years ago. Is it driving a car? Snowboarding? Cooking a gourmet meal? Speaking a new language? Your past experiences with word problems happened when you were younger—now you're older and ready to succeed!

## Use a Problem-Solving Strategy for Word Problems

We have reviewed translating English phrases into algebraic expressions, using some basic mathematical vocabulary and symbols. We have also translated English sentences into algebraic equations and solved some word problems. The word problems applied math to everyday situations. We restated the situation in one sentence, assigned a variable, and then wrote an equation to solve the problem. This method works as long as the situation is familiar and the math is not too complicated.

Now, we'll expand our strategy so we can use it to successfully solve any word problem. We'll list the strategy here, and then we'll use it to solve some problems. We summarize below an effective strategy for problem-solving.

## HOW TO

### Use a Problem-Solving Strategy to Solve Word Problems.

1. Read the problem. Make sure all the words and ideas are understood.
2. Identify what we are looking for.
3. Name what we are looking for. Choose a variable to represent that quantity.
4. Translate into an equation. It may be helpful to restate the problem in one sentence with all the important information. Then, translate the English sentence into an algebraic equation.
5. Solve the equation using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

### Example 3.7.1

Pilar bought a purse on sale for \$18, which is one-half of the original price. What was the original price of the purse?

#### **Solution**

**Step 1: Read the problem. Read the problem two or more times if necessary. Look up any unfamiliar words in a dictionary or on the internet.**

In this problem, is it clear what is being discussed? Is every word familiar?

**Step 2: Identify what you are looking for.**

Did you ever go into your bedroom to get something and then forget what you were looking for? It's hard to find something if you are not sure what it is! Read the problem again and look for words that tell you what you are looking for!

In this problem, the words "what was the original price of the purse" tell us what we need to find.

**Step 3: Name what we are looking for.**

Choose a variable to represent that quantity. We can use any letter for the variable, but choose one that makes it easy to remember what it represents.

Let  $p$  = the original price of the purse.

**Step 4: Translate into an equation.**

It may be helpful to restate the problem in one sentence with all the important information. Translate the English sentence into an algebraic equation.

Reread the problem carefully to see how the given information is related. Often, there is one sentence that gives this information, or it may help to write one sentence with all the important information. Look for clue words to help translate the sentence into algebra. Translate the sentence into an equation.

Restate the problem in one sentence with all the important information.

18 is one-half the original price.

Translate into an equation.

$$18 = \frac{1}{2} \times p$$

**Step 5: Solve the equation using good algebraic techniques.**

Even if you know the solution right away, using good algebraic techniques here will better prepare you to solve problems that do not have obvious answers.

Solve the equation:

$$18 = \frac{1}{2}p$$

Multiply both sides by 2.       $2 \times 18 = 2 \times \frac{1}{2}p$

Simplify       $36 = p$

**Step 6: Check the answer in the problem to make sure it makes sense.**

We solved the equation and found that  $p = 36$ , which means “the original price” was \$36.

Does \$36 make sense in the problem? Yes, because 18 is one-half of 36, and the purse was on sale at half the original price.

**Step 7: Answer the question with a complete sentence.** The problem asked “What was the original price of the purse?”

The answer to the question is: “The original price of the purse was \$36.”

If this were a homework exercise, our work might look like this:

Pilar bought a purse on sale for **\$18**, which is one-half the original price. What was the original price of the purse?

Let  $p$  = the original price.

**18** is one-half the original price.

$$18 = \frac{1}{2}p$$

Multiply both sides by 2.       $2 \times 18 = 2 \times \frac{1}{2}p$

Simplify       $36 = p$

**Step 8: Check. Is \$36 a reasonable price for a purse?**

Yes.

Is **18** one half of **36**?

$$18 \stackrel{?}{=} \frac{1}{2} \times 36$$

$$18 = 18 \checkmark$$

The original price of the purse was **\$36**.

## Try It

10) Joaquin bought a bookcase on sale for **\$120**, which was two-thirds of the original price. What was the original price of the bookcase?

**Solution**

**\$180**

11) Two-fifths of the songs in Mariel's playlist are country. If there are **16** country songs, what is the total number of songs in the playlist?

**Solution**

Let's try this approach with another example.

### Example 3.7.2

Ginny and her classmates formed a study group. The number of girls in the study group was three more than twice the number of boys. There were **11** girls in the study group. How many boys were in the study group?

#### **Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

How many boys were in the study group?

**Step 3: Name. Choose a variable to represent the number of boys.**

Let  $n$  = the number of boys.

**Step 4: Translate. Restate the problem in one sentence with all the important information.**

The number of girls (11) was three more than twice the number of boys.

Translate into an equation.

$$11 = 2b + 3$$

**Step 5: Solve the equation.**

	$11 = 2b + 3$
Subtract 3 from each side	$11 - 3 = 2b + 3 - 3$
Simplify	$8 = 2b$
Divide each side by 2	$\frac{8}{2} = \frac{2b}{2}$
Simplify	$4 = b$

**Step 6: Check. First, is our answer reasonable?**

Yes, having 4 boys in a study group seems OK. The problem says the number of girls was 3 more than twice the number of boys. If there are four boys, does that make eleven girls? Twice 4 boys is 8. Three more than 8 is 11.

**Step 7: Answer the question.**

There were 4 boys in the study group.

**Try It**

12) Guillermo bought textbooks and notebooks at the bookstore. The number of textbooks was 3 more than twice the number of notebooks. He bought 7 textbooks. How many notebooks did he buy?

**Solution**

2

13) Gerry worked Sudoku puzzles and crossword puzzles this week. The number of Sudoku puzzles he completed is eight more than twice the number of crossword puzzles. He completed 22 Sudoku puzzles. How many crossword puzzles did he do?

**Solution**

7

## Solve Number Problems

Now that we have a problem-solving strategy, we will use it on several different types of word problems. The first type we will work on is “number problems.” Number problems give some clues about one or more numbers. We use these clues to write an equation. Number problems don’t usually arise on an everyday basis, but they provide a good introduction to practicing the problem-solving strategy outlined above.

### Example 3.7.3

The difference of a number and six is **13**. Find the number.

#### **Solution**

**Step 1: Read the problem. Are all the words familiar?**

**Step 2: Identify what we are looking for.**

The number.

**Step 3: Name. Choose a variable to represent the number.**

Let  $n$  = the number.

**Step 4: Translate. Remember to look for clue words like “difference... of... and...”**

Restate the problem as one sentence.

The difference of the number and 6 is 13.

Translate into an equation.

$$n - 6 = 13$$

**Step 5: Solve the equation.**

Simplify.

$$\begin{aligned} n - 6 &= 13 \\ n &= 19 \end{aligned}$$

**Step 6: Check.**

The difference of **19** and **6** is **13**. It checks!

**Step 7: Answer the question.**

The number is **19**.

## Try It

14) The difference of a number and eight is **17**. Find the number.

**Solution**

**25**

15) The difference of a number and eleven is **—7**. Find the number.

**Solution**

**4**

## Example 3.7.4

The sum of twice a number and seven is **15**. Find the number.

**Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

The number.

**Step 3: Name. Choose a variable to represent the number.**

Let  $n$  = the number.

**Step 4: Translate.**

Restate the problem as one sentence.

The sum of twice a number and 7 is 13.

Translate into an equation.

$$2n + 7 = 15$$

**Step 5: Solve the equation.**

Subtract 7 from each side and simplify.

$$2n + 7 = 15$$

Divide each side by 2 and simplify.

$$2n = 8$$

$$n = 4$$

**Step 6: Check.**

Is the sum of twice 4 and 7 equal to 15?

**Step 7: Answer the question.**

The number is 4.

Did you notice that we left out some of the steps as we solved this equation? If you're not yet ready to leave out these steps, write down as many as you need.

**Try It**

16) The sum of four times a number and two is 14. Find the number.

**Solution**

3

17) The sum of three times a number and seven is 25. Find the number.

**Solution**

6

Some number word problems ask us to find two or more numbers. It may be tempting to name them all with

different variables, but so far we have only solved equations with one variable. In order to avoid using more than one variable, we will define the numbers in terms of the same variable. Be sure to read the problem carefully to discover how all the numbers relate to each other.

### Example 3.7.5

One number is five more than another. The sum of the numbers is **21**. Find the numbers.

#### **Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

We are looking for two numbers.

**Step 3: Name. We have two numbers to name and need a name for each.**

Choose a variable to represent the first number.

$$n = 1^{st} \text{ number}$$

What do we know about the second number?

$$n + 5 = 2^{nd} \text{ number}$$

**Step 4: Translate. Restate the problem as one sentence with all the important information.**

The sum of the  $1^{st}$  number and the  $2^{nd}$  number is **21**.

Translate into an equation.

$$\underbrace{1^{st} \text{ number}} + \underbrace{2^{nd} \text{ number}} = \underbrace{21}$$

Substitute the variable expressions.

$$n + n + 5 = 21$$

**Step 5: Solve the equation.**

Combine like terms.

Subtract 5 from both sides and simplify.

Divide by 2 and simplify.

Find the second number, too

$$n + n + 5 = 21$$

$$2n + 5 = 21$$

$$2n = 16$$

$$n = 8$$

$$n + 5$$

$$8 + 5 = 13$$

$1^{st}$  number

$2^{nd}$  number

**Step 6: Check.**

Do these numbers check in the problem?

Is one number 5 more than the other?

$$13 \stackrel{?}{=} 8 + 5$$

Is thirteen 5 more than 8? Yes.

$$13 = 13 \checkmark$$

Is the sum of the two numbers 21?

$$8 + 13 \stackrel{?}{=} 21$$

$$21 = 21 \checkmark$$

**Step 7: Answer the question.**

The numbers are 8 and 13.

## Try It

18) One number is six more than another. The sum of the numbers is twenty-four. Find the numbers.

**Solution**

9, 15

19) The sum of two numbers is fifty-eight. One number is four more than the other. Find the numbers.

**Solution**

27, 31

## Example 3.7.6

The sum of two numbers is negative fourteen. One number is four less than the other. Find the numbers.

### Solution

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

We are looking for two numbers.

**Step 3: Name.**

Choose a variable.

$$n = 1^{st} \text{ number}$$

One number is 4 less than the other.

$$n - 4 = 2^{nd} \text{ number}$$

**Step 4: Translate.**

The sum of the 2 numbers is negative 14.

Write as one sentence.

$$\underbrace{1^{st} \text{ number}} + \underbrace{2^{nd} \text{ number}} \underbrace{\text{is}} \underbrace{\text{negative 14}}$$

Translate into an equation.

$$n + n - 4 = -14$$

**Step 5: Solve the equation.**

Combine like terms.

$$n + n - 4 = -14$$

$$2n - 4 = -14$$

Add 4 to each side and simplify.

$$2n = -10$$

$$n = -5$$

$1^{st} \text{ number}$

Simplify.

$$n - 4$$

$2^{nd} \text{ number}$

$$-5 - 4 = -9$$

**Step 6: Check.**

Is -9 four less than -5?

$$\begin{aligned} -5 - 4 &\stackrel{?}{=} -9 \\ -9 &= -9 \checkmark \end{aligned}$$

Is their sum -14?

$$\begin{aligned} -5 + (-9) &\stackrel{?}{=} -14 \\ -14 &= -14 \checkmark \end{aligned}$$

**Step 7: Answer the question.**The numbers are  $-5$  and  $-9$ .**Try It**

20) The sum of two numbers is negative twenty-three. One number is seven less than the other. Find the numbers.

**Solution** $-15, -8$ 

21) The sum of two numbers is  $-18$ . One number is  $40$  more than the other. Find the numbers.

**Solution** $-29, 11$ **Example 3.7.7**

One number is ten more than twice another. Their sum is one. Find the numbers.

**Solution****Step 1: Read the problem.****Step 2: Identify what you are looking for.**

We are looking for two numbers.

**Step 3: Name.**

Choose a variable.

$$x = 1^{st} \text{ number}$$

One number is 10 more than twice another.

$$2x + 10 = 2^{nd} \text{ number}$$

**Step 4: Translate.**

Their sum is one.

Restate as one sentence.

The sum of the two numbers is 1.

Translate into an equation.

$$x + 2x + 10 = 1$$

**Step 5: Solve the equation.**

$$x + 2x + 10 = 1$$

Combine like terms.

$$3x + 10 = 1$$

Subtract 10 from each side.

$$3x = -9$$

Divide each side by 3.

$$x = -3$$

 $1^{st} \text{ number}$ 

$$2x + 10$$

 $2^{nd} \text{ number}$ 

$$2(-3) + 10 = 4$$

**Step 6: Check.**Is ten more than twice  $-3$  equal to 4?

$$2(-3) + 10 \stackrel{?}{=} 4$$

$$-6 + 10 \stackrel{?}{=} 4$$

$$4 = 4 \checkmark$$

Is their sum 1?

$$-3 + 4 \stackrel{?}{=} 1$$

$$1 = 1$$

**Step 7: Answer the question.**

The numbers are  $-3$  and  $-4$ .

## Try It

22) One number is eight more than twice another. Their sum is negative four. Find the numbers.

**Solution**

$-4, 0$

23) One number is three more than three times another. Their sum is  $-5$ . Find the numbers.

**Solution**

$-3, -2$

Some number problems involve consecutive integers. *Consecutive integers* are integers that immediately follow each other. Examples of consecutive integers are:

1, 2, 3, 4  
 $-10, -9, -8, -7$   
 150, 151, 152, 153

Notice that each number is one more than the number preceding it. So if we define the first integer as  $n$ , the next consecutive integer is  $n + 1$ . The one after that is one more than  $n + 1$ , so it is  $n + 1 + 1$ , which is  $n + 2$ .

$n$	1 <sup>st</sup> integer
$n + 1$	2nd consecutive integer
$n + 2$	3rd consecutive integer... etc.

### Example 3.7.8

The sum of two consecutive integers is 47. Find the numbers.

#### Solution

**Step 1: Read the problem.**

**Step 2: Identify what you are looking for.**

Two consecutive integers.

**Step 3: Name each number.**

$$\begin{aligned}n &= 1^{\text{st}} \text{ integer} \\n + 1 &= 2^{\text{nd}} \text{ next consecutive integer}\end{aligned}$$

**Step 4: Translate.**

Restate as one sentence.

The sum of the integers is 47.

Translate into an equation.

$$n + n + 1 = 47$$

**Step 5: Solve the equation.**

$$\begin{array}{ll}n + n + 1 = 47 & \\ \text{Combine like terms.} & 2x + 1 = 47 \\ \text{Subtract 1 from each side.} & 2n = 46 \\ \text{Divide each side by 2.} & n = 23 \quad 1^{\text{st}} \text{ integer} \\ & \textcolor{red}{n} + 1 \quad 2^{\text{nd}} \text{ integer} \\ & \textcolor{red}{23} + 1 = 24\end{array}$$

**Step 6: Check.**

$$\begin{aligned}23 + 24 &\stackrel{?}{=} 47 \\ 47 &= 47 \checkmark\end{aligned}$$

**Step 7: Answer the question.**

The two consecutive integers are 23 and 24.

## Try It

24) The sum of two consecutive integers is **95**. Find the numbers.

**Solution**

47, 48

25) The sum of two consecutive integers is **−31**. Find the numbers.

**Solution**

−16, −15

## Example 3.7.9

Find three consecutive integers whose sum is **−42**.

**Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

three consecutive integers

**Step 3: Name each of the three numbers.**

$$n = 1^{st} \text{ integer}$$

$$n + 1 = 2^{nd} \text{ consecutive integer}$$

$$n + 2 = 3^{rd} \text{ consecutive integer}$$

**Step 4: Translate.**

Restate as one sentence.

The sum of the three integers is  $-42$ .

Translate into an equation.

$$n + n + 1 + n + 2 = -42$$

**Step 5: Solve the equation.**

	$n + n + 1 + n + 2 = -42$	
Combine like terms.	$3n + 3 = -42$	
Subtract 3 from each side.	$3n = -45$	
Divide each side by 3.	$n = -15$	$1^{st} \text{ integer}$
	$n + 1$	
	$-15 + 1 = -14$	$2^{nd} \text{ integer}$
	$-15 + 2 = -13$	$3^{rd} \text{ integer}$

**Step 6: Check.**

$$\begin{aligned} -13 + (-14) + (-15) &\stackrel{?}{=} -42 \\ -42 &= -42 \checkmark \end{aligned}$$

**Step 7: Answer the question.**

The three consecutive integers are  $-13$ ,  $-14$ , and  $-15$ .

## Try It

26) Find three consecutive integers whose sum is  $-96$ .

**Solution**

$-33$ ,  $-32$ ,  $-31$

27) Find three consecutive integers whose sum is  $-36$ .

**Solution**

$-13$ ,  $-12$ ,  $-11$

Now that we have worked with consecutive integers, we will expand our work to include consecutive even integers and consecutive odd integers. *Consecutive even integers* are even integers that immediately follow one another. Examples of consecutive even integers are:

$$\begin{aligned} &18, 20, 22 \\ &64, 66, 68 \\ &-12, -10, -8 \end{aligned}$$

Notice each integer is 2 more than the number preceding it. If we call the first one  $n$ , then the next one is  $n + 2$ . The next one would be  $n + 2 + 2$  or  $n + 4$ .

$n$	1 <sup>st</sup> even integer
$n + 2$	2 <sup>nd</sup> consecutive even integer
$n + 4$	3 <sup>rd</sup> consecutive even integer... etc.

*Consecutive odd integers* are odd integers that immediately follow one another. Consider the consecutive odd integers 77, 79, and 81.

$$\begin{aligned} &77, 79, 81 \\ &n, n + 2, n + 4 \end{aligned}$$

$n$	1 <sup>st</sup> odd integer
$n + 2$	2 <sup>nd</sup> consecutive odd integer
$n + 4$	3 <sup>rd</sup> consecutive odd integer... etc.

Does it seem strange to add 2 (an even number) to get from one odd integer to the next? Do you get an odd number or an even number when we add 2 to 3? to 11? to 47?

Whether the problem asks for consecutive even numbers or odd numbers, you don't have to do anything different. The pattern is still the same—to get from one odd or one even integer to the next, add 2.

### Example 3.7.10

Find three consecutive even integers whose sum is 84.

#### Solution

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

three consecutive even integers

**Step 3: Name the integers.**

$$n = 1^{\text{st}} \text{ integer}$$

$$\text{Let } n + 2 = 2^{\text{nd}} \text{ consecutive even integer}$$

$$n + 4 = 3^{\text{rd}} \text{ consecutive even integer}$$

**Step 4: Translate.**

Restate as one sentence.

The sum of the three even integers is 84.

Translate into an equation.

$$n + n + 2 + n + 4 = 84$$

**Step 5: Solve the equation.**

$$n + n + 2 + n + 4 = 84$$

Combine like terms.

$$3n + 6 = 84$$

Subtract 6 from each side.

$$3n + 6 - 6 = 84 - 6$$

Divide each side by 3.

$$3n = 78$$

$$n = 26$$

$1^{\text{st}}$  integer

$$n + 2$$

$2^{\text{nd}}$  integer

$$26 + 2 = 28$$

$$n + 4$$

$3^{\text{rd}}$  integer

$$26 + 4 = 30$$

**Step 6: Check.**

$$26 + 28 + 30 \stackrel{?}{=} 84$$

$$84 = 84 \checkmark$$

**Step 7: Answer the question.**

The three consecutive integers are **26, 28, and 30**.

## Try It

28) Find three consecutive even integers whose sum is **102**.

**Solution**

**32, 34, 36**

29) Find three consecutive even integers whose sum is **−24**.

**Solution**

**−10, −8, −6**

## Example 3.7.11

A married couple together earns **\$110,000** a year. The wife earns **\$16,000** less than twice what her husband earns. What does the husband earn?

**Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

How much does the husband earn?

**Step 3: Name.**

Choose a variable to represent the amount the husband earns.

Let  $h$  = the amount the husband earns.

The wife earns \$16,000 less than twice that.

$2h - 16,000$  the amount the wife earns.

Together the husband and wife earn \$110,000.

**Step 4: Translate.**

Restate the problem in one sentence with all the important information.

The amount the husband earns + the amount the wife earns is \$110,000

Translate into an equation.

$$h + 2h - 16,000 = 110,000$$

**Step 5: Solve the equation.**

Combine like terms.

$$h + 2h - 16,000 = 110,000$$

Add 16,000 to both sides and simplify.

$$3h - 16,000 = 110,000$$

Divide each side by 3.

$$3h = 126,000$$

$$h = 42,000$$

$$\$42,000$$

*the amount the husband earns*

$$2h - 16$$

*the amount the wife earns*

$$2(42,000) - 16,000$$

$$84,000 - 16,000 = 68,000$$

**Step 6: Check.**

If the wife earns \$68,000 and the husband earns \$42,000 is the total \$110,000? Yes!

**Step 7: Answer the question.**

The husband earns \$42,000 a year.

## Try It

30) According to the National Automobile Dealers Association, the average cost of a car in 2014 was \$28,500. This was \$1,500 less than 6 times the cost in 1975. What was the average cost of a car in 1975?

**Solution**

\$5,000

31) U.S. Census data shows that the median price of new home in the United States in November 2014 was \$280,900. This was \$10,700 more than 14 times the price in November 1964. What was the median price of a new home in November 1964?

**Solution**

\$19,300

## Translate and Solve Basic Percent Equations

We will solve percent equations using the methods we used to solve equations with fractions or decimals. Without the tools of algebra, the best method available to solve percent problems was by setting them up as proportions. Now as an algebra student, you can just translate English sentences into algebraic equations and then solve the equations.

We can use any letter you like as a variable, but it is a good idea to choose a letter that will remind us of what you are looking for. We must be sure to change the given percent to a decimal when we put it in the equation.

### Example 3.7.12

Translate and solve: What number is 35% of 90?

**Solution**

What number is 35% of 90?

**Step 1: Translate into algebra. Let  $n$  = the number.**

Remember “of” means multiply, “is” means equals.

$$n = 0.35 \cdot 90$$

**Step 2: Multiply.**

$$n = 31.5$$

31.5 is 35% of 90.

### Try It

32) Translate and solve:

What number is 45% of 80?

**Solution**

36

33) Translate and solve:

What number is 55% of 60?

**Solution**

33

We must be very careful when we translate the words in the next example. The unknown quantity will not be isolated at first, like it was in Example 3.7.12. We will again use direct translation to write the equation.

### Example 3.7.13

Translate and solve: 6.5% of what number is \$1.17?

**Solution**

6.5% of what number is \$1.17?

**Step 1: Translate. Let  $n$  = the number.**

$$0.065 \cdot n = 1.17$$

**Step 2: Solve.**

Multiply.

Divide both sides by 0.065 and simplify.

6.5% of \$18 is \$1.17.

$$0.065 \cdot n = 1.17$$

$$0.065n = 1.17$$

$$n = 18$$

### Try It

34) Translate and solve: 7.5% of what number is \$1.95?

**Solution**

\$26

35) Translate and solve: 8.5% of what number is \$3.06?

**Solution**

\$36

In the next example, we are looking for the percent.

### Example 3.7.14

Translate and solve: 144 is what percent of 96?

**Solution**

$\underbrace{144}$   $\underbrace{\text{is}}$   $\underbrace{\text{what percent}}$   $\underbrace{\text{of}}$   $\underbrace{96?}$

**Step 1: Translate into algebra. Let  $p$  = the percent.**

$$144 = p \cdot 96$$

**Step 2: Solve.**

Multiply.

$$144 = p \cdot 96$$

Divide both sides by 96 and simplify.

$$144 = 96p$$

$$1.5 = p$$

Convert to percent.

$$150\% = p$$

144 is 150% of 96.

Note that we are asked to find percent, so we must have our final result in percent form.

### Try It

36) Translate and solve:

110 is what percent of 88?

**Solution**

125%

37) Translate and solve:

126 is what percent of 72?

**Solution**

175%

## Solve Applications of Percent

Many applications of percent—such as tips, sales tax, discounts, and **interest**—occur in our daily lives. To solve these applications we'll translate to a basic percent equation, just like those we solved in previous examples. Once we translate the sentence into a percent equation, we know how to solve it.

We will restate the problem solving strategy we used earlier for easy reference.

### HOW TO

#### Use a Problem-Solving Strategy to Solve an Application.

1. Read the problem. Make sure all the words and ideas are understood.
2. Identify what we are looking for.
3. Name what we are looking for. Choose a variable to represent that quantity.
4. Translate into an equation. It may be helpful to restate the problem in one sentence with all the important information. Then, translate the English sentence into an algebraic equation.
5. Solve the equation using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

Now that we have the strategy to refer to, and have practised solving basic percent equations, we are ready

to solve percent applications. Be sure to ask yourself if your final answer makes sense—since many of the applications will involve everyday situations, you can rely on your own experience.

### Example 3.7.15

Dezohn and his girlfriend enjoyed a nice dinner at a restaurant and his bill was \$68.50. He wants to leave an 18% tip. If the tip will be 18% of the total bill, how much tip should he leave?

#### **Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

the amount of tip should Dezohn leave

**Step 3: Name what we are looking for.**

Choose a variable to represent it.

Let  $t$  = amount of tip.

**Step 4: Translate into an equation.**

Write a sentence that gives the information to find it.

The tip is 18% of the total bill.

Translate the sentence into an equation.

The tip is 18% of \$68.50

**Step 5: Solve the equation.**

$$t = 0.18 \cdot 68.50$$

Multiply.  $t = 12.33$

**Step 6: Check. Does this make sense?**

Yes, 18% of \$68.50 is \$12.33.

**Step 7: Answer the question with a complete sentence.**

Dezohn should leave a tip of \$12.33.

Notice that we used  $t$  to represent the unknown tip.

## Try It

38) Cierra and her sister enjoyed a dinner in a restaurant and the bill was **\$81.50**. If she wants to leave **18%** of the total bill as her tip, how much should she leave?

**Solution**

**\$14.67**

39) Kimngoc had lunch at her favourite restaurant. She wants to leave **15%** of the total bill as her tip. If her bill was **\$14.40**, how much will she leave for the tip?

**Solution**

**\$2.16**

## Example 3.7.16

The label on Masao's breakfast cereal said that one serving of cereal provides **85** milligrams (mg) of potassium, which is **2%** of the recommended daily amount. What is the total recommended daily amount of potassium?

**Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

the total amount of potassium that is recommended

**Step 3: Name what we are looking for.**

Choose a variable to represent it.

Let  $a$  = total amount of potassium.

**Step 4: Translate.**

Write a sentence that gives the information to find it.

$85mg$  is  $2\%$  of the total amount

Translate into an equation.

$$85 = 0.02 \cdot a$$

**Step 5: Solve the equation.**

$$\begin{aligned} 85 &= 0.02 \cdot a \\ 4,250 &= a \end{aligned}$$

**Step 6: Check. Does this make sense?**

Yes,  $2\%$  is a small percent and  $85$  is a small part of  $4,250$ .

**Step 7: Answer the question with a complete sentence.**

The amount of potassium that is recommended is  $4,250mg$ .

**Try It**

40) One serving of wheat square cereal has seven grams of fibre, which is  $28\%$  of the recommended daily amount. What is the total recommended daily amount of fibre?

**Solution**

$25g$

41) One serving of rice cereal has  $190mg$  of sodium, which is  $8\%$  of the recommended daily amount. What is the total recommended daily amount of sodium?

**Solution**

$2,375mg$

### Example 3.7.17

Mitzi received some gourmet brownies as a gift. The wrapper said each brownie was **480** calories, and had **240** calories of fat. What percent of the total calories in each brownie comes from fat?

#### Solution

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

the percent of the total calories from fat

**Step 3: Name what we are looking for.**

Choose a variable to represent it.

Let  $p$  = percent of fat.

**Step 4: Translate. Write a sentence that gives the information to find it.**

What percent of 480 is 240?

Translate into an equation.

$$p \cdot 480 = 240$$

**Step 5: Solve the equation.**

	$480p = 240$
Divide by 480	$p = 0.5$
Put in percent form	$p = 50\%$

**Step 6: Check. Does this make sense?**

Yes, 240 is half of 480, so 50% makes sense.

**Step 7: Answer the question with a complete sentence.**

Of the total calories in each brownie, 50% is fat.

## Try It

42) Solve. Round to the nearest whole percent.

Veronica is planning to make muffins from a mix. The package says each muffin will be **230** calories and **60** calories will be from fat. What percent of the total calories is from fat?

**Solution**

**26%**

43) Solve. Round to the nearest whole percent.

The mix Ricardo plans to use to make brownies says that each brownie will be **190** calories, and **76** calories are from fat. What percent of the total calories are from fat?

**Solution**

**40%**

## Find Percent Increase and Percent Decrease

People in the media often talk about how much an amount has increased or decreased over a certain period of time. They usually express this increase or decrease as a percent.

To find the percent increase, first we find the amount of increase, the difference of the new amount and the original amount. Then we find what percent the amount of increase is of the original amount.

### HOW TO

#### Find the Percent Increase.

1. Find the amount of increase.  

$$\text{new amount} - \text{original amount} = \text{increase}$$

2. Find the percent increase.  
The increase is what percent of the original amount?

### Example 3.7.18

In 2011, the California governor proposed raising community college fees from **\$26** a unit to **\$36** a unit. Find the percent increase. (Round to the nearest tenth of a percent.)

#### Solution

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

the percent increase

**Step 3: Name what we are looking for.**

Choose a variable to represent it.

Let  $p$  = the percent.

**Step 4: Translate.**

Write a sentence that gives the information to find it.

new amount – original amount = increase

First find the amount of increase.

$$36 - 26 = 10$$

Find the percent.

Increase is what percent of the original amount?

$\underbrace{10}$   $\underbrace{\text{is}}$   $\underbrace{\text{what percent}}$   $\underbrace{\text{of}}$   $\underbrace{26?}$

Translate into an equation.

$$10 = p \cdot 26$$

**Step 5: Solve the equation.**

Divide by 26.

Change to percent form; round to the nearest tenth.

$$10 = 26p$$

$$0.384 = p$$

$$38.4\% = p$$

**Step 6: Check. Does this make sense?**

Yes,  $38.4\%$  is close to  $\frac{1}{3}$  and 10 is close to  $\frac{1}{3}$  of 26.

**Step 7: Answer the question with a complete sentence.**

The new fees represent a  $38.4\%$  increase over the old fees.

Notice that we rounded the division to the nearest thousandth in order to round the percent to the nearest tenth.

**Try It**

44) Find the percent increase. (Round to the nearest tenth of a percent.)

In 2011, the IRS increased the deductible mileage cost to **55.5** cents from **51** cents.

**Solution**

$8.8\%$

45) Find the percent increase.

In 1995, the standard bus fare in Chicago was **\$1.50**. In 2008, the standard bus fare was **\$2.25**.

**Solution**

$50\%$

Finding the percent decrease is very similar to finding the percent increase, but now the amount of decrease is the difference of the original amount and the new amount. Then we find what percent the amount of decrease is of the original amount.

## HOW TO

### Find the Percent Decrease.

1. Find the amount of decrease.  
original amount – new amount = decrease
2. Find the percent decrease.  
Decrease is what percent of the original amount?

### Example 3.7.19

The average price of a gallon of gas in one city in June 2014 was **\$3.71**. The average price in that city in July was **\$3.64**. Find the percent decrease.

#### **Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

the percent decrease

**Step 3: Name what we are looking for.**

Choose a variable to represent that quantity.

Let  $p$  = the percent decrease.

**Step 4: Translate.**

Write a sentence that gives the information to find it.

First find the amount of decrease.

$$3.71 - 3.64 = 0.07$$

Find the percent.

Decrease is what percent of the original amount?

0.07 is what percent of 3.71?

Translate into an equation.

$$0.07 = p \cdot 3.71$$

**Step 5: Solve the equation.**

Divide by 3.71.

Change to percent form; round to the nearest tenth.

$$0.07 = 3.71p$$

$$0.019 = p$$

$$1.9\% = p$$

**Step 6: Check. Does this make sense?**

Yes, if the original price was \$4, a 2% decrease would be 8 cents.

**Step 7: Answer the question with a complete sentence.**

The price of gas decreased 1.9%.

## Try It

46) Find the percent decrease. (Round to the nearest tenth of a percent.)

The population of North Dakota was about 672, 000 in 2010. The population is projected to be about 630, 000 in 2020.

**Solution**

6.3%

47) Find the percent decrease.

Last year, Sheila's salary was \$42, 000. Because of furlough days, this year, her salary was \$37, 800.

**Solution**

10%

## Solve Simple Interest Applications

Do you know that banks pay you to keep your money? The money a customer puts in the bank is called the **principal**,  $P$ , and the money the bank pays the customer is called the **interest**. The interest is computed as a certain percent of the principal; called the **rate of interest**,  $r$ . We usually express rate of interest as a percent per year, and we calculate it by using the decimal equivalent of the percent. The variable  $t$ , (for *time*) represents the number of years the money is in the account.

To find the interest we use the **simple interest** formula,  $I = Prt$ .

### Simple Interest

If an amount of money,  $P$ , called the principal, is invested for a period of  $t$  years at an annual interest rate  $r$ , the amount of interest,  $I$ , earned is

$$I = Prt \quad \text{where} \quad \begin{array}{l} I = \text{interest} \\ P = \text{principal} \\ r = \text{rate} \\ t = \text{time} \end{array}$$

Interest earned according to this formula is called simple interest.

Interest may also be calculated another way, called compound interest. This type of interest will be covered in later math classes.

The formula we use to calculate simple interest is  $I = Prt$ . To use the formula, we substitute in the values the problem gives us for the variables, and then solve for the unknown variable. It may be helpful to organize the information in a chart.

### Example 3.7.20

Nathaly deposited \$12,500 in her bank account where it will earn 4% interest. How much interest will Nathaly earn in 5 years?

$$I = ?$$

$$P = \$12,500$$

$$r = 4\%$$

$$t = 5 \text{ years}$$

#### Solution

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

the amount of interest earned

**Step 3: Name what we are looking for.**

Choose a variable to represent that quantity.

Let  $I$  = the amount of interest.

**Step 4: Translate into an equation.**

Write the formula

$$I = Prt$$

Substitute in the given information

$$I = (12,500)(0.04)(5)$$

**Step 5: Solve the equation.**

$$I = 2,500$$

**Step 6: Check: Does this make sense?**

Is \$2,500 a reasonable interest on \$12,500? Yes.

**Step 7: Answer the question with a complete sentence.**

The interest is \$2,500.

## Try It

48) Areli invested a principal of **\$950** in her bank account with interest rate **3%**. How much interest did she earn in **5** years?

**Solution**

**\$142.50**

49) Susana invested a principal of **\$36,000** in her bank account with interest rate **6.5%**. How much interest did she earn in **3** years?

**Solution**

**\$7,020**

There may be times when we know the amount of interest earned on a given principal over a certain length of time, but we don't know the rate. To find the rate, we use the simple interest formula, substitute in the given values for the principal and time, and then solve for the rate.

## Example 3.7.21

Loren loaned his brother **\$3,000** to help him buy a car. In **4** years his brother paid him back the **\$3,000** plus **\$660** in interest. What was the rate of interest?

$$I = \$660$$

$$P = \$3,000$$

$$r =$$

$$t = 4 \text{ years}$$

**Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

the rate of interest

**Step 3: Name what we are looking for.**

Choose a variable to represent that quantity.

Let  $r$  = the rate of interest.

**Step 4: Translate into an equation.**

Write the formula

$$I = Prt$$

Substitute in the given information

$$660 = (3000)r(4)$$

**Step 5: Solve the equation.**

$$660 = (3,000)r(4)$$

Multiply.

$$660 = (12,000)r$$

Divide.

$$0.055 = r$$

Change to percent form.

$$5.5\% = r$$

**Step 6: Check: Does this make sense?**

$$I = Prt$$

$$660 \stackrel{?}{=} (3000)(0.055)(4)$$

$$660 = 660 \checkmark$$

**Step 7: Answer the question with a complete sentence.**

The rate of interest was 5.5%.

Notice that in this example, Loren's brother paid Loren interest, just like a bank would have paid interest if Loren invested his money there.

## Try It

50) Jim loaned his sister \$5,000 to help her buy a house. In 3 years, she paid him the \$5,000, plus \$900 interest. What was the rate of interest?

**Solution**

6%

51) Hang borrowed \$7,500 from her parents to pay her tuition. In 5 years, she paid them \$1,500 interest in addition to the \$7,500 she borrowed. What was the rate of interest?

**Solution**

4%

## Example 3.7.22

Eduardo noticed that his new car loan papers stated that with a 7.5% interest rate, he would pay \$6,596.25 in interest over 5 years. How much did he borrow to pay for his car?

**Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

the amount borrowed (the principal)

**Step 3: Name what we are looking for.**

Choose a variable to represent that quantity.

Let  $P$  = principal borrowed.

**Step 4: Translate into an equation.**

Write the formula

$$I = Prt$$

Substitute in the given information

$$6,596.25 = P(0.075)(5)$$

**Step 5: Solve the equation.**

$$6,596 = P(0.075)(5)$$

Multiply.  $6,596.25 = 0.375P$

Divide.  $17,590 = P$

**Step 6: Check: Does this make sense?**

$$I = Prt$$

$$6,596.25 \stackrel{?}{=} (17,590)(0.075)(5)$$

$$6,596.25 = 6,596.25 \checkmark$$

**Step 7: Answer the question with a complete sentence.**

The principal was \$17,590.

## Try It

52) Sean's new car loan statement said he would pay \$4,866.25 in interest from an interest rate of 8.5% over 5 years. How much did he borrow to buy his new car?

**Solution**

\$11,450

53) In 5 years, Gloria's bank account earned \$2,400 interest at 5%. How much had she deposited in the account?

**Solution**

\$9,600

## Solve Applications with Discount or Mark-up

Applications of discount are very common in retail settings. When you buy an item on sale, the original price has been discounted by some dollar amount. The **discount rate**, usually given as a percent, is used to determine the amount of the discount. To determine the **amount of discount**, we multiply the discount rate by the original price.

We summarize the discount model in the box below.

### Discount

amount of discount = discount rate  $\times$  original price

sale price = original price – amount of discount

Keep in mind that the sale price should always be less than the original price.

### Example 3.7.23

Elise bought a dress that was discounted **35%** off of the original price of **\$140**.

What was a. the amount of discount and b. the sale price of the dress?

#### Solution

a. Original Price = **\$140** Discount rate = **35%** Discount = ?

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

the amount of discount

**Step 3: Name what we are looking for.**

Choose a variable to represent that quantity.

Let  $d$  = the amount of discount.

**Step 4: Translate into an equation.**

Write a sentence that gives the information to find it.

The discount is 35% of \$140.

Translate into an equation.

$$d = 0.35(140)$$

**Step 5: Solve the equation.**

$$d = 0.35(140)$$

$$d = 49$$

**Step 6: Check: Does this make sense?**

Is a \$49 discount reasonable for a \$140 dress? Yes.

**Step 7: Write a complete sentence to answer the question.**

The amount of discount was \$49.

b. Read the problem again.

**Step 1: Identify what we are looking for.**

the sale price of the dress

**Step 2: Name what we are looking for.**

Choose a variable to represent that quantity.

Let  $s$  = the sale price.

**Step 3: Translate into an equation.**

Write a sentence that gives the information to find it.

The sale price is the \$140 minus the \$49 discount

Translate into an equation.

$$s = 140 - 49$$

**Step 4: Solve the equation.**

$$s = 140 - 49$$

$$s = 91$$

**Step 5: Check. Does this make sense?**

Is the sale price less than the original price?

Yes, \$91 is less than \$140.

**Step 6: Answer the question with a complete sentence.**

The sale price of the dress was \$91.

**Try It**

54) Find

- a. the amount of discount and
- b. the sale price:

Sergio bought a belt that was discounted 40% from an original price of \$29.

**Solution**

- a. \$11.60
- b. \$17.40

55) Find

- a. the amount of discount and
- b. the sale price:

Oscar bought a barbecue that was discounted 65% from an original price of \$395.

**Solution**

- a. \$256.75
- b. \$138.25

There may be times when we know the original price and the sale price, and we want to know the discount rate. To find the discount rate, first we will find the amount of discount and then use it to compute the rate as a percent of the original price. Example 3.7.24 will show this case.

### Example 3.7.24

Jeannette bought a swimsuit at a sale price of **\$13.95**. The original price of the swimsuit was **\$31**. Find the:

- a. amount of discount and
- b. discount rate.

#### **Solution**

a.

Original price = **\$31**

Discount = ?

Sale price = **\$13.95**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

the amount of discount

**Step 3: Name what we are looking for.**

Choose a variable to represent that quantity.

Let  $d$  = the amount of discount.

**Step 4: Translate into an equation.**

Write a sentence that gives the information to find it.

The discount is the difference between the original price and the sale price.

Translate into an equation.

$$d = 31 - 13.95$$

**Step 5: Solve the equation.**

$$d = 31 - 13.95$$

$$d = 17.05$$

**Step 6: Check: Does this make sense?**

Is 17.05 less than 31? Yes.

**Step 7: Answer the question with a complete sentence.**

The amount of discount was \$17.05.

---

b. Read the problem again.

1. When we translate this into an equation, we obtain 17.05 equals  $r$  times 31. We are told to solve the equation 17.05 equals  $31r$ . We divide by 31 to obtain 0.55 equals  $r$ . We put this in percent form to obtain  $r$  equals 55. We are told to check: does this make sense? Is 7.05 equal to 55 of  $> 1$ ? Below this, we have 17.05 equals with a question mark over it 0.55 times 31. Below this, we have 17.05 equals 17.05 with a checkmark next to it. Then we are told to answer the question with a complete sentence: The rate of discount was 55%.

**Step 1: Identify what we are looking for.**

the discount rate

**Step 2: Name what we are looking for.**

Choose a variable to represent it.

Let  $r$  = the discount rate.

**Step 3: Translate into an equation.**

Write a sentence that gives the information to find it.

The discount of \$17.05 is what percent of \$31?

Translate into an equation.

$$17.05 = r \cdot 31$$

**Step 4: Solve the equation.**

	$17.05 = 31r$
Divide both sides by 31.	$0.55 = r$
Change to percent form	$r = 55\%$

**Step 5: Check. Does this make sense?**

Is \$17.05 equal to 55% of \$31?

$$17.05 = 0.55 \times (31)$$

$$17.05 = 17.05 \checkmark$$

**Step 6: Answer the question with a complete sentence.**

The rate of discount was **55%**.

## Try It

56) Find

- a. the amount of discount and
- b. the discount rate.

Lena bought a kitchen table at the sale price of **\$375.20**. The original price of the table was **\$560**.

### **Solution**

- a. **\$184.80**
- b. **33%**

57) Find

- a. the amount of discount and
- b. the discount rate.

Nick bought a multi-room air conditioner at a sale price of **\$340**. The original price of the air conditioner was **\$400**.

### **Solution**

- a. **\$60**
- b. **15%**

Applications of **mark-up** are very common in retail settings. The price a retailer pays for an item is called the original cost. The retailer then adds a mark-up to the original cost to get the list price, the price he sells the item for. The mark-up is usually calculated as a percent of the original cost. To determine the amount of mark-up, multiply the mark-up rate by the original cost.

We summarize the mark-up model in the box below.

## Mark-Up

amount of mark-up = mark-up rate  $\times$  original cost

list price = original cost + amount of mark up

Keep in mind that the **list price** should always be more than the **original cost**.

### Example 3.7.25

Adam's art gallery bought a photograph at original cost **\$250**. Adam marked the price up **40%**. Find the:

- amount of mark-up and
- the list price of the photograph.

#### Solution

a.

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

the amount of mark-up

**Step 3: Name what we are looking for.**

Choose a variable to represent it.

Let  $m$  = the amount of markup.

**Step 4: Translate into an equation.**

Write a sentence that gives the information to find it.

The mark-up is 40% of the \$250 original cost

Translate into an equation.

$$m = 0.40 \cdot 250$$

**Step 5: Solve the equation.**

$$m = 0.40 \cdot 250$$

$$m = 100$$

**Step 6: Check. Does this make sense?**

Yes, 40% is less than one-half and 100 is less than half of 250.

**Step 7: Answer the question with a complete sentence.**

The mark-up on the photograph was \$100.

b.

**Step 1: Read the problem again.**

**Step 2: Identify what we are looking for.**

the list price

**Step 3: Name what we are looking for.**

Choose a variable to represent it.

Let  $p$  = the list price.

**Step 4: Translate into an equation.**

Write a sentence that gives the information to find it.

The list price is original cost plus the mark-up

Translate into an equation.

$$p = 250 + 100$$

**Step 5: Solve the equation.**

$$p = 250 + 100$$

$$p = 350$$

**Step 6: Check. Does this make sense?**

Is the list price more than the net price?

Is \$350 more than \$250? Yes

**Step 7: Answer the question with a complete sentence.**

The list price of the photograph was \$350.

## Try It

58) Find

- a. the amount of mark-up and
- b. the list price.

Jim's music store bought a guitar at the original cost **\$1, 200**. Jim marked the price up **50%**.

**Solution**

- a. **\$600**
- b. **\$1, 800**

59) Find

- a. the amount of mark-up and
- b. the list price.

The Auto Resale Store-bought Pablo's Toyota for **\$8, 500**. They marked the price up **35%**.

**Solution**

- a. **\$2, 975**
- b. **\$11, 475**

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it*

online here:

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=1269#h5p-21>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## Glossary

### **amount of discount**

The amount of discount is the amount resulting when a discount rate is multiplied by the original price of an item.

### **discount rate**

The discount rate is the percent used to determine the amount of a discount, common in retail settings.

### **interest**

Interest is the money that a bank pays its customers for keeping their money in the bank.

### **list price**

The list price is the price a retailer sells an item for.

### **mark-up**

A mark-up is a percentage of the original cost used to increase the price of an item.

### **original cost**

The original cost in a retail setting, is the price that a retailer pays for an item.

### **principal**

The principal is the original amount of money invested or borrowed for a period of time at a specific interest rate.

### **rate of interest**

The rate of interest is a percent of the principal, usually expressed as a percent per year.

**simple interest**

Simple interest is the interest earned according to the formula  $I = Prt$ .

## 3.8 SOLVE MIXTURE AND UNIFORM MOTION APPLICATIONS

---

### Learning Objectives

By the end of this section, you will be able to:

- Solve coin word problems
- Solve ticket and stamp word problems
- Solve mixture word problems
- Use the mixture model to solve investment problems using simple interest
- Solve uniform motion applications

### Try It

Before you get started, take this readiness quiz:

- 1) Multiply:  $14(0.25)$ .
- 2) Solve:  $(0.25x) + 0.10(x + 4) = 2.5$
- 3) The number of dimes is three more than the number of quarters. Let  $q$  represent the number of quarters. Write an expression for the number of dimes.
- 4) Find the distance traveled by a car going **70** miles per hour for **3** hours.

5) Solve  $x + 1.2(x - 10) = 98$ .

6) Convert 90 minutes to hours.

## Solve Coin Word Problems

In **mixture problems**, we will have two or more items with different values to combine together. The mixture model is used by grocers and bartenders to make sure they set fair prices for the products they sell. Many other professionals, like chemists, investment bankers, and landscapers also use the mixture model. Doing the Manipulative Mathematics activity *Coin Lab* will help you develop a better understanding of mixture word problems.

We will start by looking at an application everyone is familiar with—money!

Imagine that we take a handful of coins from a pocket or purse and place them on a desk. How would we determine the value of that pile of coins? If we can form a step-by-step plan for finding the total value of the coins, it will help us as we begin solving coin word problems.

So what would we do? To get some order to the mess of coins, we could separate the coins into piles according to their value. Quarters would go with quarters, dimes with dimes, nickels with nickels, and so on. To get the total value of all the coins, we would add the total value of each pile.

Figure 3.8.1.

How would we determine the value of each pile? Think about the dime pile—how much is it worth? If we count the number of dimes, we'll know how many we have—the *number* of dimes.

But this does not tell us the *value* of all the dimes. Say we counted 17 dimes, how much are they worth? Each dime is worth \$0.10—that is the *value* of one dime. To find the total value of the pile of 17 dimes, multiply 17 by \$0.10 to get \$1.70. This is the total value of all 17 dimes. This method leads to the following model.

## HOW TO

### Total Value of Coins

For the same type of coin, the total value of a number of coins is found by using the model

$$\textit{number} \times \textit{value} = \textit{total}$$

Where

*number* is the number of coins

*value* is the value of each coin

*total value* is the total value of all the coins

The number of dimes times the value of each dime equals the total value of the dimes.

$$\textit{Number} \times \textit{Value} = \textit{Total Value}$$

We could continue this process for each type of coin, and then we would know the total value of each type of coin. To get the total value of *all* the coins, add the total value of each type of coin.

Let's look at a specific case. Suppose there are **14** quarters, **17** dimes, **21** nickels, and **39** pennies.

Type	Number	Value(\$)	= Total Value (\$)
Quarters	14	0.25	3.50
Dimes	17	0.10	1.70
Nickels	21	0.05	1.05
Pennies	39	0.01	0.39
			6.64

The total value of all the coins is **\$6.64**.

Notice how the chart helps organize all the information! Let's see how we use this method to solve a coin word problem.

Example 3.8.1

Adalberto has \$2.25 in dimes and nickels in his pocket. He has nine more nickels than dimes. How many of each type of coin does he have?

Solution

Step 1: Read the problem. Make sure all the words and ideas are understood.

- **Determine** the types of coins involved.  
Think about the strategy we used to find the value of the handful of coins. The first thing we need is to notice what types of coins are involved. Adalberto has dimes and nickels.
- **Create a table** to organize the information. See chart below.
  - Label the columns “type,” “number,” “value,” “total value.”
  - List the types of coins.
  - Write in the value of each type of coin.
  - Write in the total value of all the coins.

Type	Number	Value (\$)	= Total Value (\$)
Dimes		0.10	
Nickels		0.05	
			2.25

We can work this problem all in cents or in dollars. Here we will do it in dollars and put in the dollar sign (\$) in the table as a reminder.  
The value of a dime is \$0.10 and the value of a nickel is \$0.05. The total value of all the coins is \$2.25. The table below shows this information.

Step 2: Identify what we are looking for.

- We are asked to find the number of dimes and nickels Adalberto has.

Step 3: Name what we are looking for. Choose a variable to represent that quantity.

- Use variable expressions to represent the number of each type of coin and write them in the table.
- Multiply the number times the value to get the total value of each type of coin.

Next we counted the number of each type of coin. In this problem we cannot count each type of coin—that is what you are looking for—but we have a clue. There are nine more nickels than dimes. The number of nickels is nine more than the number of dimes.

Let  $d$  = number of dimes.

$d + 9$  = number of nickels

Fill in the “number” column in the table to help get everything organized.

Type	Number	Value (\$)	= Total Value (\$)
Dimes	$d$	0.10	
Nickels	$d + 9$	0.05	
			2.25

Now we have all the information we need from the problem!

We multiply the number times the value to get the total value of each type of coin. While we do not know the actual number, we do have an expression to represent it.

And so now multiply  $\text{number} \times \text{value} = \text{total value}$ . See how this is done in the table below.

Type	Number	Value (\$)	= Total Value (\$)
Dimes	$d$	0.10	$0.10d$
Nickels	$d + 9$	0.05	$0.05(d + 9)$
			2.25

Notice that we made the heading of the table show the model.

**Step 4: Translate into an equation. It may be helpful to restate the problem in one sentence. Translate the English sentence into an algebraic equation.**

Write the equation by adding the total values of all the types of coins.

	Value of dimes	+	Value of nickels	=	Total value of coins
Translate to an equation	$0.10d$	+	$0.05(d + 9)$	=	$2.25$

**Step 5: Solve the equation using good algebra techniques.**

Now solve this equation	$0.10d + 0.05(d + 9) = 2.25$
-------------------------	------------------------------

Distribute	$0.10d + 0.05d + 0.45 = 2.25$
------------	-------------------------------

Combine like terms	$0.15d + 0.45 = 2.25$
--------------------	-----------------------

Subtract 0.45 from each side	$0.15d = 2.25$
------------------------------	----------------

Divide	$d = 12$
--------	----------

So there are 12 dimes

The number of nickels is ( $d + 9$ )	$d + 9$
--------------------------------------	---------

$12 + 9 = 21$	
---------------	--

**Step 6: Check the answer in the problem and make sure it makes sense.**

Does this check?

---

12 dimes	$12(0.10) = 1.20$
----------	-------------------

21 nickels	$21(0.05) = 2.25\checkmark$
------------	-----------------------------

---

**Step 7: Answer the question with a complete sentence.**

- Adalberto has twelve dimes and twenty-one nickels.

If this were a homework exercise, our work might look like the following.

Adalberto has \$2.25 in dimes and nickels in his pocket. He has nine more nickels than dimes.

How many of each type does he have?

Type	Number	• Value(\$)	= Total Value (\$)
Dimes	d	0.10	0.10d
Nickels	d + 9	0.05	0.05(d + 9)
			2.25 ✓

$$12 \text{ dimes} \quad 12(0.10) = 1.20$$

$$21 \text{ nickels} \quad 21(0.05) = \underline{1.05}$$

$$\$2.25 \checkmark$$

Adalberto has twelve dimes

and twenty-one nickels.

$$0.10d + 0.05d + 0.45 = 2.25 \quad d + 9$$

$$0.15d + 0.45 = 2.25 \quad 12 + 9$$

$$0.15d = 1.80 \quad 21 \text{ nickels}$$

$$d = 12 \text{ dimes}$$

Figure 3.8.2

## Try It

7) Michaela has \$2.05 in dimes and nickels in her change purse. She has seven more dimes than nickels. How many coins of each type does she have?

### Solution

9 nickels, 16 dimes

8) Liliana has \$2.10 in nickels and quarters in her backpack. She has 12 more nickels than quarters. How many coins of each type does she have?

### Solution

17 nickels, 5 quarters

## HOW TO

### Solve Coin Word Problems.

**Step 1: Read the problem. Make sure all the words and ideas are understood.**

- Determine the types of coins involved.
- Create a table to organize the information.
- Label the columns “type,” “number,” “value,” “total value.”
- List the types of coins.
- Write in the value of each type of coin.
- Write in the total value of all the coins.

Type	Number	Value(\$)	Total Value(\$)

Figure 3.8.3

**Step 2: Identify what we are looking for.**

**Step 3: Name what we are looking for. Choose a variable to represent that quantity.**

Use variable expressions to represent the number of each type of coin and write them in the table.

Multiply the number times the value to get the total value of each type of coin.

**Step 4: Translate into an equation.**

It may be helpful to restate the problem in one sentence with all the important information. Then, translate the sentence into an equation.

Write the equation by adding the total values of all the types of coins.

**Step 5: Solve the equation using good algebra techniques.**

**Step 6: Check the answer in the problem and make sure it makes sense.**

**Step 7: Answer the question with a complete sentence.**

## Example 3.8.2

Maria has \$2.43 in quarters and pennies in her wallet. She has twice as many pennies as quarters. How many coins of each type does she have?

### Solution

#### Step 1: Read the problem.

Determine the types of coins involved.

We know that Maria has quarters and pennies.

Create a table to organize the information.

- Label the columns “type,” “number,” “value,” “total value.”
- List the types of coins.
- Write in the value of each type of coin.
- Write in the total value of all the coins.

Type	Number	Value (\$)	=	Total Value (\$)
Quarters		0.25		
Pennies		0.01		
				2.43

#### Step 2: Identify what you are looking for.

- We are looking for the number of quarters and pennies.

#### Step 3: Name. Represent the number of quarters and pennies using variables.

- We know Maria has twice as many pennies as quarters. The number of pennies is defined in terms of quarters.
- Let  $q$  represent the number of quarters.
- Then the number of pennies is  $2q$ .

Type	Number	Value (\$)	=	Total Value (\$)
Quarters	$q$	0.25		
Pennies	$2q$	0.01		
				2.43

Multiply the 'number' and the 'value' to get the 'total value' of each type of coin.

Type	Number	Value (\$)	=	Total Value (\$)
Quarters	$q$	0.25		$0.25q$
Pennies	$2q$	0.01		$0.01(2q)$
				2.43

**Step 4: Translate. Write the equation by adding the 'total value' of all the types of coins.**

**Step 5: Solve the equation.**

$$\begin{aligned}
 &0.25q + 0.01(2q) = 2.43 \\
 &\text{Multiply} \qquad \qquad \qquad 0.25q + 0.02q = 2.43 \\
 &\text{Combine like terms} \qquad \qquad 0.27q = 2.43 \\
 &\text{Divide by 0.27} \qquad \qquad \qquad d = 9 \\
 &\text{The number of pennies is } 2q \qquad \qquad \qquad 2q \\
 &\qquad \qquad \qquad \qquad \qquad \qquad \qquad \qquad 2 \cdot 9 = 18 \text{ pennies}
 \end{aligned}$$

**Step 6: Check the answer in the problem.**

Maria has 9 quarters and 18 pennies. Does this make \$2.43?

$$\begin{array}{ll}
 9 \text{ quarters} & 9(0.25) = 2.25 \\
 18 \text{ pennies} & 18(0.01) = 0.18 \\
 \text{Total} & \$2.43 \checkmark
 \end{array}$$

**Step 7: Answer the question.**

Maria has nine quarters and eighteen pennies.

## Try It

9) Sumanta has \$4.20 in nickels and dimes in her piggy bank. She has twice as many nickels as dimes. How many coins of each type does she have?

### Solution

42 nickels, 21 dimes.

10) Alison has three times as many dimes as quarters in her purse. She has \$9.35 altogether. How many coins of each type does she have?

### Solution

51 dimes, 17 quarters.

In the next example, we'll show only the completed table—remember the steps we take to fill in the table.

## Example 3.8.3

Danny has \$2.14 worth of pennies and nickels in his piggy bank. The number of nickels is two more than ten times the number of pennies. How many nickels and how many pennies does Danny have?

### Solution

#### Step 1: Read the problem.

Determine the types of coins involved.

pennies and nickels

Create a table. Write in the value of each type of coin.

Pennies are worth \$0.01.

Nickels are worth \$0.05.

**Step 2: Identify what we are looking for.**

the number of pennies and nickels

**Step 3: Name. Represent the number of each type of coin using variables.**

The number of nickels is defined in terms of the number of pennies, so start with pennies.

Let  $p$  = number of pennies

The number of nickels is two more than ten times the number of pennies.

Let  $10p + 2$  = number of nickels

Multiply the number and the value to get the total value of each type of coin.

Type	Number	Value (\$)	Total Value (\$)
Pennies	$p$	0.01	$0.01p$
Nickels	$10p + 2$	0.05	$0.05(10p + 2)$
			2.14

**Step 4: Translate. Write the equation by adding the total value of all the types of coins.**

$$0.01p + 0.05(10p + 2) = 2.14$$

**Step 5: Solve the equation.**

$$0.01p + 0.50p + 0.10 = 2.14$$

$$0.51p + 0.10 = 2.14$$

$$0.51p = 2.04$$

$$p = 4 \text{ pennies}$$

How many nickels?

$$10p + 2$$

$$10(4) + 2$$

$$42 \text{ nickles}$$

**Step 7: Answer the question.**

Danny has four pennies and 42 nickels.

## Try It

11) Jesse has **\$6.55** worth of quarters and nickels in his pocket. The number of nickels is five more than two times the number of quarters. How many nickels and how many quarters does Jesse have?

**Solution**

**41** nickels, **18** quarters

12) Elane has **\$7.00** total in dimes and nickels in her coin jar. The number of dimes that Elane has is seven less than three times the number of nickels. How many of each coin does Elane have?

**Solution**

**22** nickels, **59** dimes

## Solve Ticket and Stamp Word Problems

Problems involving tickets or stamps are very much like coin problems. Each type of ticket and stamp has a value, just like each type of coin does. So to solve these problems, we will follow the same steps we used to solve coin problems.

### Example 3.8.4

At a school concert, the total value of tickets sold was **\$1,506**. Student tickets sold for **\$6** each and adult tickets sold for **\$9** each. The number of adult tickets sold was five less than three times the number of student tickets sold. How many student tickets and how many adult tickets were sold?

**Solution****Step 1: Read the problem.**

- Determine the types of tickets involved. There are student tickets and adult tickets.
- Create a table to organize the information.

Type	Number	Value (\$)	=	Total Value (\$)
Student		6		
Adult		9		
				1506

**Step 2: Identify what we are looking for.**

- We are looking for the number of student and adult tickets.

**Step 3: Name. Represent the number of each type of ticket using variables.**

We know the number of adult tickets sold was five less than three times the number of student tickets sold.

- Let  $s$  be the number of student tickets.
- Then  $3s - 5$  is the number of adult tickets

Multiply the number times the value to get the total value of each type of ticket.

Type	Number	Value (\$)	=	Total Value (\$)
Student	$s$	6		$6s$
Adult	$3s - 5$	9		$9(3s - 5)$
				1506

**Step 4: Translate. Write the equation by adding the total values of each type of ticket.**

$$6s + 9(3s - 5) = 1506$$

**Step 5: Solve the equation.**

$$6s + 27s - 45 = 1506$$

$$33s - 45 = 1506$$

$$s = 4$$

$$= 3s - 5$$

$$= 3(47) - 5$$

136 adult tickets.

**Step 6: Check the answer.**

There were 47 student tickets at \$6 each and 136 adult tickets at \$9 each. Is the total value \$1,506? We find the total value of each type of ticket by multiplying the number of tickets times its value then add to get the total value of all the tickets sold.

$$47 \times 6 = 282$$

$$136 \times 9 = 1,224$$

$$= 1,506 \checkmark$$

**Step 7: Answer** the question. They sold 47 student tickets and 136 adult tickets.

## Try It

13) The first day of a water polo tournament the total value of tickets sold was \$17,610. One-day passes sold for \$20 and tournament passes sold for \$30. The number of tournament passes sold was 37 more than the number of day passes sold. How many day passes and how many tournament passes were sold?

**Solution**

330 day passes, 367 tournament passes

14) At the movie theatre, the total value of tickets sold was \$2,612.50. Adult tickets sold for \$10 each and senior/child tickets sold for \$7.50 each. The number of senior/child tickets sold was 25 less than twice the number of adult tickets sold. How many senior/child tickets and how many adult tickets were sold?

**Solution**

112 adult tickets, 199 senior/child tickets

We have learned how to find the total number of tickets when the number of one type of ticket is based on the number of the other type. Next, we'll look at an example where we know the total number of tickets and have to figure out how the two types of tickets relate.

Suppose Bianca sold a total of 100 tickets. Each ticket was either an adult ticket or a child ticket. If she sold 20 child tickets, how many adult tickets did she sell?

- *Did you say '80'? How did you figure that out? Did you subtract 20 from 100?*

If she sold 45 child tickets, how many adult tickets did she sell?

- *Did you say '55'? How did you find it? By subtracting 45 from 100?*

What if she sold 75 child tickets? How many adult tickets did she sell?

- *The number of adult tickets must be  $100 - 75$ . She sold 25 adult tickets.*

Now, suppose Bianca sold  $x$  child tickets. Then how many adult tickets did she sell? To find out, we would follow the same logic we used above. In each case, we subtracted the number of child tickets from 100 to get the number of adult tickets. We now do the same with  $x$ .

We have summarized this below.

Child tickets	Adult tickets
20	80
45	55
75	25
$x$	$100 - x$

We can apply these techniques to other examples

### Example 3.8.5

Galen sold **810** tickets for his church's carnival for a total of **\$2,820**. Children's tickets cost **\$3** each and adult tickets cost **\$5** each. How many children's tickets and how many adult tickets did he sell?

#### Solution

##### Step 1: Read the problem.

- Determine the types of tickets involved. There are children tickets and adult tickets.
- Create a table to organize the information.

Type	Number	Value (\$)	= Total Value (\$)
Children		3	
Adult		5	
			2820

##### Step 2: Identify what we are looking for.

- We are looking for the number of children and adult tickets.

##### Step 3: Name. Represent the number of each type of ticket using variables.

- We know the total number of tickets sold was 810. This means the number of children's tickets plus the number of adult tickets must add up to 810.
- Let  $c$  be the number of children tickets.
- Then  $810 - c$  is the number of adult tickets.
- Multiply the number times the value to get the total value of each type of ticket.

Type	Number	Value (\$)	= Total Value (\$)
Children	$c$	3	$3c$
Adult	$810 - c$	5	$5(810 - c)$
			2820

**Step 4: Translate.**

Write the equation by adding the total values of each type of ticket.

**Step 5: Solve the equation.**

$$3c + 5(810 - c) = 2,820$$

$$3c + 5(810 - c) = 2,820$$

$$-2c = -1,230$$

$$c = 615 \text{ children tickets}$$

How many adults?

$$810 - c$$

$$810 - 615$$

195 adult tickets

**Step 6: Check the answer. There were 615 children's tickets at \$3 each and 195 adult tickets at \$5 each. Is the total value \$2,820?**

$$615 \times 3 = 1,845$$

$$195 \times 5 = 975$$

$$= 2,820 \checkmark$$

**Step 7: Answer the question. Galen sold 615 children's tickets and 195 adult tickets.**

## Try It

15) During her shift at the museum ticket booth, Leah sold **115** tickets for a total of **\$1,163**. Adult tickets cost **\$12** and student tickets cost **\$5**. How many adult tickets and how many student tickets did Leah sell?

### Solution

**84** adult tickets, **31** student tickets

16) A whale-watching ship had **40** paying passengers on board. The total collected from tickets was **\$1,196**. Full-fare passengers paid **\$32** each and reduced-fare passengers paid **\$26** each. How many full-fare passengers and how many reduced-fare passengers were on the ship?

### Solution

**26** full-fare, **14** reduced fare

Now, we'll do one where we fill in the table all at once.

## Example 3.8.6

Monica paid \$8.36 for stamps. The number of 41-cent stamps was four more than twice the number of two-cent stamps. How many 41-cent stamps and how many two-cent stamps did Monica buy?

### Solution

The types of stamps are **41**-cent stamps and two-cent stamps. Their names also give the value!

"The number of **41**-cent stamps was four more than twice the number of two-cent stamps."

Let  $x$  = number of 2-cent stamps.

$2x + 4$  = number of 41-cent stamps

Type	Number	Value (\$)	= Total Value (\$)
41 cent stamps	$2x + 4$	0.41	$0.41(2x + 4)$
2 cent stamps	$x$	0.02	$0.02x$
			8.36

**Step 1: Write the equation from the total values.**

$$0.41(2x + 4) + 0.02x = 8.36$$

**Step 2: Solve the equation.**

$$0.82x + 1.64 + 0.02x = 8.36$$

$$0.84x + 1.64 = 8.36$$

$$0.84x = 6.72$$

$$x = 8$$

Monica bought eight two-cent stamps.

$$2x + 4 \text{ for } x = 8$$

**Step 3: Find the number of 41-cent stamps she bought by evaluating.**

$$2x + 4$$

$$2(8) + 4$$

$$20$$

**Step 4: Check.**

$$8(0.02) + 20(0.41) \stackrel{?}{=} 8.36$$

$$0.16 + 8.20 \stackrel{?}{=} 8.36$$

$$8.36 = 8.36 \checkmark$$

Monica bought eight two-cent stamps and 20 41-cent stamps.

## Try It

17) Eric paid **\$13.36** for stamps. The number of **41**-cent stamps was eight more than twice the number of two-cent stamps. How many **41**-cent stamps and how many two-cent stamps did Eric buy?

**Solution**

**32** at **\$0.41**, **12** at **\$0.02**

18) Kailee paid **\$12.66** for stamps. The number of **41**-cent stamps was four less than three times the number of **20**-cent stamps. How many **41**-cent stamps and how many **20**-cent stamps did Kailee buy?

**Solution**

**26** at **\$0.41**, **10** at **\$0.20**

## Mixture Word Problems

Now we'll solve some more general applications of the mixture model. Grocers and bartenders use the mixture model to set a fair price for a product made from mixing two or more ingredients. Financial planners use the mixture model when they invest money in a variety of accounts and want to find the overall interest rate. Landscape designers use the mixture model when they have an assortment of plants and a fixed budget, and event coordinators do the same when choosing appetizers and entrees for a banquet.

Our first mixture word problem will be making trail mix from raisins and nuts.

### Example 3.8.7

Henning is mixing raisins and nuts to make **10** pounds of trail mix. Raisins cost **\$2** a pound and nuts cost **\$6** a pound. If Henning wants his cost for the trail mix to be **\$5.20** a pound, how many pounds of raisins and how many pounds of nuts should he use?

#### Solution

As before, we fill in a chart to organize our information.

The **10** pounds of trail mix will come from mixing raisins and nuts.

$$\begin{aligned}x &= \text{number of pounds of raisins} \\10 - x &= \text{number of pounds of nuts}\end{aligned}$$

We enter the price per pound for each item.

We multiply the number times the value to get the total value.

Type	Number of pounds	Price per pound (\$)	= Total Value (\$)
Raisins	$x$	2	$2x$
Nuts	$10 - x$	6	$6(10 - x)$
Trail mix	10	5.20	$10(5.20)$

Notice that the last line in the table gives the information for the total amount of the mixture.

We know the value of the raisins plus the value of the nuts will be the value of the trail mix.

**Step 1: Write the equation from the total values.**

$$2x + 6(10 - x) = 10(5.20)$$

**Step 2: Solve the equation.**

$$\begin{aligned}2x + 60 - 6x &= 52 \\-4x &= -8 \\x &= 2 \text{ pounds of raisins}\end{aligned}$$

**Step 3: Find the number of pounds of nuts.**

$$\begin{array}{r} 10 - x \\ 10 - 2 \\ \hline 8 \text{ pounds of nuts} \end{array}$$

**Step 4: Check.**

$$\begin{aligned} 2(\$2) + 8(\$6) &\stackrel{?}{=} 10(\$5.20) \\ \$4 + 48 &\stackrel{?}{=} \$52 \\ \$52 &= \$52 \checkmark \end{aligned}$$

Henning mixed two pounds of raisins with eight pounds of nuts.

## Try It

19) Orlando is mixing nuts and cereal squares to make a party mix. Nuts sell for **\$7** a pound and cereal squares sell for **\$4** a pound. Orlando wants to make **30** pounds of party mix at a cost of **\$6.50** a pound, how many pounds of nuts and how many pounds of cereal squares should he use?

### Solution

**5** pounds cereal squares, **25** pounds nuts

20) Becca wants to mix fruit juice and soda to make a punch. She can buy fruit juice for **\$3** a gallon and soda for **\$4** a gallon. If she wants to make **28** gallons of punch at a cost of **\$3.25** a gallon, how many gallons of fruit juice and how many gallons of soda should she buy?

### Solution

**21** gallons of fruit punch, **7** gallons of soda

We can also use the mixture model to solve investment problems using simple interest. We have used the simple interest formula,  $I = Prt$ , where  $t$  represented the number of years. When we just need to find the interest for one year,  $t = 1$ , so then  $I = Pr$ .

### Example 3.8.8

Stacey has \$20,000 to invest in two different bank accounts. One account pays interest at 3 per year and the other account pays interest at 5 per year. How much should she invest in each account if she wants to earn 4.5 interest per year on the total amount?

#### Solution

We will fill in a chart to organize our information. We will use the simple interest formula to find the interest earned in the different accounts.

The interest on the mixed investment will come from adding the interest from the account earning 3 and the interest from the account earning 5 to get the total interest on the \$20,000.

$$\begin{aligned}\text{Let } x &= \text{amount invested at } 3\% \\ 20,000 - x &= \text{amount invested at } 5\%\end{aligned}$$

The amount invested is the *principal* for each account.

We enter the interest rate for each account.

We multiply the amount invested times the rate to get the interest.

Type	Amount Invested	Rate	= Interest
3%	$x$	0.03	$0.03x$
5%	$20,000 - x$	0.05	$0.05(20,000 - x)$
4.5%	20,000	0.045	$0.045(20,000)$

Notice that the total amount invested, 20,000, is the sum of the amount invested at 3 and the amount invested at 5. And the total interest,  $0.045(20,000)$  is the sum of the interest earned in the 3 account and the interest earned in the 5% account.

As with the other mixture applications, the last column in the table gives us the equation to solve.

**Step 1: Write the equation from the interest earned.**

$$0.03x + 0.05(20,000 - x) = 0.045(20,000)$$

**Step 2: Solve the equation.**

$$0.03x + 0.05(20,000 - x) = 0.045(20,000)$$

$$0.03x + 1000 - 0.05x = 900$$

$$-0.02x + 1000 = 900$$

$$-0.02x = -100$$

$$x = 5,000 \text{ amount invested at } 3\%$$

**Step 3: Find the amount invested at 5%.**

$$20,000 - x$$

$$20,000 - 5,000$$

$$15,000 = \text{amount invested at } 5\%$$

**Step 4: Check.**

$$0.03x + 0.05(15,000 + x) \stackrel{?}{=} 0.045(20,000)$$

$$150 + 750 \stackrel{?}{=} 900$$

$$900 = 900 \checkmark$$

Stacey should invest \$5,000 in the account that earns 3% and \$15,000 in the account that earns 5%.

## Try It

21) Remy has \$14,000 to invest in two mutual funds. One fund pays interest at 4 per year and the other fund pays interest at 7 per year. How much should she invest in each fund if she wants to earn 6.1 interest on the total amount?

**Solution**

\$4,200 at 4, \$9,800 at 7

22) Marco has \$8,000 to save for his daughter's college education. He wants to divide it between one account that pays 3.2 interest per year and another account that pays 8 interest per year.

How much should he invest in each account if he wants the interest on the total investment to be 6.5?

**Solution**

\$2,500 at 3.2, \$5,500 at 8

## Solve Uniform Motion Applications

When planning a road trip, it often helps to know how long it will take to reach the destination or how far to travel each day. We would use the distance, rate, and time formula,  $D = rt$ , which we have already seen.

In this section, we will use this formula in situations that require a little more algebra to solve than the ones we saw earlier. Generally, we will be looking at comparing two scenarios, such as two vehicles travelling at different rates or in opposite directions. When the speed of each vehicle is constant, we call applications like this *uniform motion problems*.

Our problem-solving strategies will still apply here, but we will add to the first step. The first step will include drawing a diagram that shows what is happening in the example. Drawing the diagram helps us understand what is happening so that we will write an appropriate equation. Then we will make a table to organize the information, like we did for the money applications.

The steps are listed here for easy reference:

### HOW TO

#### Use a Problem-Solving Strategy in Distance, Rate, and Time Applications.

**Step 1: Read the problem. Make sure all the words and ideas are understood.**

- Draw a diagram to illustrate what is happening.
- Create a table to organize the information.
- Label the columns rate, time, distance.
- List the two scenarios.
- Write in the information you know.

	Rate	• Time	= Distance

Figure 3.8.4

**Step 2: Identify what we are looking for.**

**Step 3: Name what we are looking for. Choose a variable to represent that quantity.**

- Complete the chart.
- Use variable expressions to represent that quantity in each row.
- Multiply the rate times the time to get the distance.

**Step 4: Translate into an equation.**

- Restate the problem in one sentence with all the important information.
- Then, translate the sentence into an equation.

**Step 5: Solve the equation using good algebra techniques.**

**Step 6: Check the answer in the problem and make sure it makes sense.**

**Step 7: Answer the question with a complete sentence.**

### Example 3.8.9

An express train and a local train leave Pittsburgh to travel to Washington, D.C. The express train can make the trip in **4** hours and the local train takes **5** hours for the trip. The speed of the express train is **12** miles per hour faster than the speed of the local train. Find the speed of both trains.

**Solution**

**Step 1: Read the problem. Make sure all the words and ideas are understood.**

- Draw a diagram to illustrate what is happening. Shown below is a sketch of what is happening in the example.

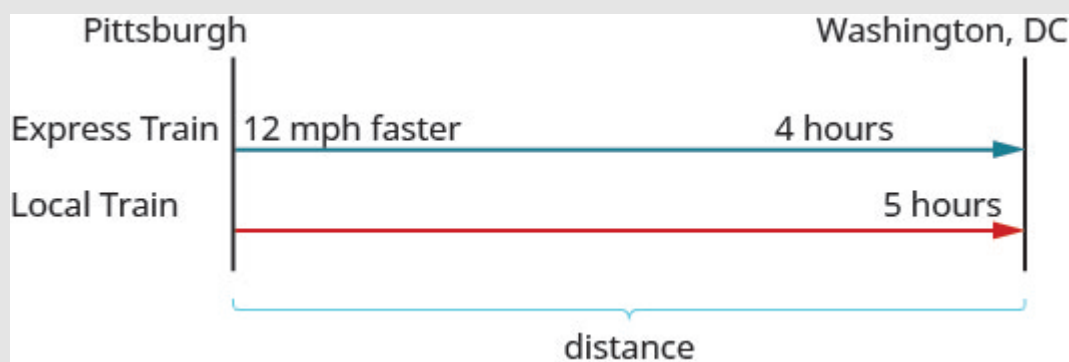

Figure 3.8.5

	Rate (mph)	•	Time (hrs)	=	Distance (miles)
Express			4		
Local			5		

- Create a table to organize the information.
- Label the columns “Rate,” “Time,” and “Distance.”
- List the two scenarios.
- Write in the information you know.

**Step 2: Identify what we are looking for.**

- We are asked to find the speed of both trains.
- Notice that the distance formula uses the word “rate,” but it is more common to use “speed” when we talk about vehicles in everyday English.

**Step 3: Name what we are looking for. Choose a variable to represent that quantity.**

- Complete the chart
- Use variable expressions to represent that quantity in each row.

- We are looking for the speed of the trains. Let's let  $r$  represent the speed of the local train. Since the speed of the express train is **12** mph faster, we represent that as  $r + 12$ .

$r$  = speed of the local train

$r + 12$  = speed of the express train

Fill in the speeds into the chart.

	Rate (mph)	Time (hrs)	= Distance (miles)
Express	$r + 12$	4	
Local	$r$	5	

Multiply the rate times the time to get the distance.

	Rate (mph)	Time (hrs)	= Distance (miles)
Express	$r + 12$	4	$4(r + 12)$
Local	$r$	5	$5r$

#### Step 4: Translate into an equation.

- Restate the problem in one sentence with all the important information.
- Then, translate the sentence into an equation.
- The equation to model this situation will come from the relation between the distances. Look at the diagram we drew above. How is the distance travelled by the express train related to the distance travelled by the local train?
- Since both trains leave from Pittsburgh and travel to Washington, D.C. they travel the same distance. So we write:

$$\text{Translate to an equation} \quad \underbrace{\text{distance travelled by express train}}_{4(r + 12)} = \underbrace{\text{distance travelled by local train}}_{5r}$$

#### Step 5: Solve the equation using good algebra techniques.

Now solve this equation.

$$4(r + 12) = 5r$$

$$4r + 48 = 5r$$

$$48 = r$$

So the speed of the local train is 48 mph.

Find the speed of the express train.

$$r + 12$$

$$48 + 12$$

$$60$$

The speed of the express train is 60 mph.

**Step 6: Check the answer in the problem and make sure it makes sense.**

express train       $60 \text{ mph}(4 \text{ hours}) = 240 \text{ miles}$

local train       $48 \text{ mph}(5 \text{ hour}) = 240 \text{ miles}$

**Step 7: Answer the question with a complete sentence.**

- The speed of the local train is 48 mph and the speed of the express train is 60 mph.

## Try It

23) Wayne and Dennis like to ride the bike path from Riverside Park to the beach. Dennis's speed is seven miles per hour faster than Wayne's speed, so it takes Wayne 2 hours to ride to the beach while it takes Dennis 1.5 hours for the ride. Find the speed of both bikers.

### Solution

Wayne 21 mph, Dennis 28 mph

24) Jeromy can drive from his house in Cleveland to his college in Chicago in 4.5 hours. It takes his mother 6 hours to make the same drive. Jeromy drives 20 miles per hour faster than his mother. Find Jeromy's speed and his mother's speed.

### Solution

Jeromy 80 mph, mother 60 mph

In Example 3.8.9, the last example, we had two trains travelling the same distance. The diagram and the chart helped us write the equation we solved. Let's see how this works in another case.

### Example 3.8.10

Christopher and his parents live 115 miles apart. They met at a restaurant between their homes to celebrate his mother's birthday. Christopher drove 1.5 hours while his parents drove 1 hour to get to the restaurant. Christopher's average speed was 10 miles per hour faster than his parents' average speed. What were the average speeds of Christopher and of his parents as they drove to the restaurant?

#### Solution

**Step 1: Read the problem. Make sure all the words and ideas are understood.**

- Draw a diagram to illustrate what is happening. Below shows a sketch of what is happening in the example.

Figure 3.8.6

- Create a table to organize the information.
- Label the columns rate, time, distance.
- List the two scenarios.
- Write in the information you know.

	Rate (mph)	Time (hrs)	= Distance (miles)
Christopher		1.5	
Parents		1	
			115

**Step 2: Identify what we are looking for.**

- We are asked to find the average speeds of Christopher and his parents.

**Step 3: Name what we are looking for. Choose a variable to represent that quantity.**

- Complete the chart.
- Use variable expressions to represent that quantity in each row.
- We are looking for their average speeds. Let's let  $r$  represent the average speed of the parents. Since the Christopher's speed is 10 mph faster, we represent that as  $r + 10$ .

Fill in the speeds into the chart.

	Rate (mph)	Time (hrs)	= Distance (miles)
Christopher	$r + 10$	1.5	$1.5(r + 10)$
Parents	$r$	1	$r$
			115

Multiply the rate times the time to get the distance.

**Step 4: Translate into an equation.**

- Restate the problem in one sentence with all the important information.
- Then, translate the sentence into an equation.
- Again, we need to identify a relationship between the distances in order to write an equation. Look at the diagram we created above and notice the relationship between the distance Christopher travelled and the distance his parents travelled.

The distance Christopher travelled plus the distance his parents travel must add up to 115 miles. So we write:

	$\underbrace{\hspace{10em}}_{\text{distance travelled by Christopher}}$	$+$	$\underbrace{\hspace{10em}}_{\text{distance travelled by his parents}}$	$= 115$
Translate to an equation	$1.5(r + 10)$	$+$	$r$	$= 115$

**Step 5: Solve the equation using good algebra techniques.**

Now solve this equation.

$$1.5(r + 10) + r = 115$$

$$1.5r + 15 + r = 115$$

$$2.5r + 15 = 115$$

$$2.5r = 100$$

$$r = 40$$

So the parents' speed was **40** mph.

Christopher's speed is  $r + 10$ .

$$r + 10$$

$$\mathbf{40} + 10 = 50$$

**Step 6: Check the answer in the problem and make sure it makes sense.**

Christopher drove  $50 \text{ mph}(1.5 \text{ hours}) = 75 \text{ miles}$

His parents drove  $40 \text{ mph}(1 \text{ hour}) = 40 \text{ miles}$   
 $= 115 \text{ miles}$

**Step 7: Answer the question with a complete sentence.**

Christopher's speed was **50** mph.

His parents' speed was **40** mph.

**Try It**

25) Carina is driving from her home in Anaheim to Berkeley on the same day her brother is driving from Berkeley to Anaheim, so they decide to meet for lunch along the way in Buttonwillow. The distance from Anaheim to Berkeley is **410** miles. It takes Carina **3** hours to get to Buttonwillow,

while her brother drives **4** hours to get there. The average speed Carina's brother drove was **15** miles per hour faster than Carina's average speed. Find Carina's and her brother's average speeds.

**Solution**

Carina **50** mph, brother **65** mph

26) Ashley goes to college in Minneapolis, **234** miles from her home in Sioux Falls. She wants her parents to bring her more winter clothes, so they decide to meet at a restaurant on the road between Minneapolis and Sioux Falls. Ashley and her parents both drove **2** hours to the restaurant. Ashley's average speed was seven miles per hour faster than her parents' average speed. Find Ashley's and her parents' average speed.

**Solution**

Parents **55** mph, Ashley **62** mph

As you read the next example, think about the relationship of the distances travelled. Which of the previous two examples is more similar to this situation?

**Example 3.8.11**

Two truck drivers leave a rest area on the interstate at the same time. One truck travels east and the other one travels west. The truck travelling west travels at **70** mph and the truck travelling east has an average speed of **60** mph. How long will they travel before they are **325** miles apart?

**Solution**

**Step 1: Read the problem. Make sure all the words and ideas are understood.**

- Draw a diagram to illustrate what is happening.

Figure 3.8.7

- Create a table to organize the information.

	Rate (mph)	•	Time (hrs)	=	Distance (miles)
West			70		
East			60		
					325

**Step 2: Identify what we are looking for.**

- We are asked to find the amount of time the trucks will travel until they are 325 miles apart.

**Step 3: Name what we are looking for. Choose a variable to represent that quantity.**

- We are looking for the time travelled. Both trucks will travel the same amount of time. Let's call the time  $t$ . Since their speeds are different, they will travel different distances.
- Complete the chart.

	Rate (mph)	•	Time (hrs)	=	Distance (miles)
West	70		$t$		$70t$
East	60		$t$		$60t$
					325

**Step 4: Translate into an equation.**

- We need to find a relation between the distances in order to write an equation. Looking at the diagram, what is the relationship between the distance each of the trucks will travel?
- The distance traveled by the truck going west plus the distance travelled by the truck going east must add up to 325 miles. So we write:

$$\begin{array}{rcl}
 \underbrace{\text{distance travelled by westbound truck}} & + \underbrace{\text{distance travelled by eastbound truck}} & = 325 \\
 70t & + & 60t
 \end{array}$$

**Step 5: Solve the equation using good algebra techniques.**

$$\begin{aligned}
 70t + 60t &= 325 \\
 130t &= 325 \\
 t &= 2.5
 \end{aligned}$$

So it will take the trucks **2.5** hours to be **325** miles apart.

**Step 6: Check the answer in the problem and make sure it makes sense.**

$$\begin{array}{ll}
 \text{Truck going West} & 70 \text{ mph}(2.5 \text{ hours}) = 175 \text{ miles} \\
 \text{Truck going East} & 60 \text{ mph}(2.5 \text{ hour}) = 150 \text{ miles} \\
 & = 325 \text{ miles}
 \end{array}$$

**Step 7: Answer the question with a complete sentence.**

It will take the trucks **2.5** hours to be **325** miles apart.

## Try It

27) Pierre and Monique leave their home in Portland at the same time. Pierre drives north on the turnpike at a speed of **75** miles per hour while Monique drives south at a speed of **68** miles per hour. How long will it take them to be **429** miles apart?

**Solution**

**3** hours

28) Thanh and Nhat leave their office in Sacramento at the same time. Thanh drives north on I-5 at a speed of **72** miles per hour. Nhat drives south on I-5 at a speed of **76** miles per hour. How long will it take them to be **330** miles apart?

**Solution**

**2.2** hours

## Matching Units in Problems

It is important to make sure the units match when we use the distance rate and time formula. For instance, if the rate is in miles per hour, then the time must be in hours.

### Example 3.8.12

When Katie Mae walks to school, it takes her **30** minutes. If she rides her bike, it takes her **15** minutes. Her speed is three miles per hour faster when she rides her bike than when she walks. What are her walking speed and her speed riding her bike?

**Solution**

First, we draw a diagram that represents the situation to help us see what is happening.

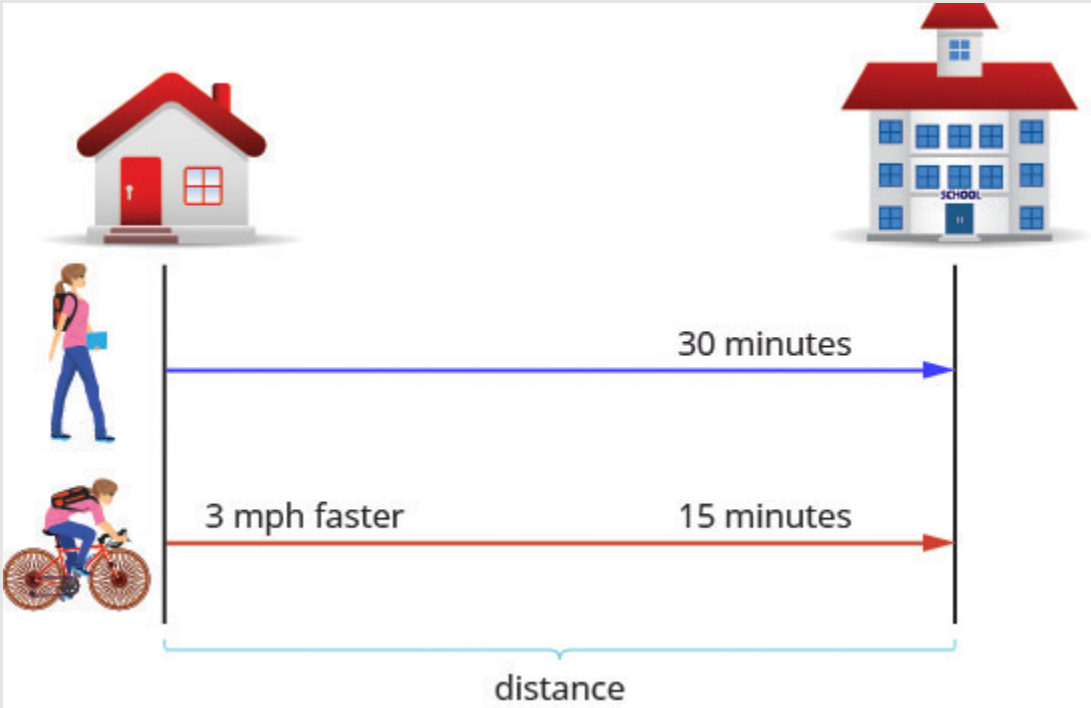

Figure 3.8.8

We are asked to find her speed walking and riding her bike. Let's call her walking speed  $r$ . Since her biking speed is three miles per hour faster, we will call that speed  $r + 3$ . We write the speeds in the chart.

The speed is in miles per hour, so we need to express the times in hours, too, in order for the units to be the same. Remember, one hour is 60 minutes. So:

$$30 \text{ minutes is } \frac{30}{60} \text{ or } \frac{1}{2} \text{ hour}$$

$$15 \text{ minutes is } \frac{15}{60} \text{ or } \frac{1}{4} \text{ hour}$$

Next, we multiply rate times time to fill in the distance column.

	Rate (mph)	·	Time (hrs)	=	Distance (miles)
Walk	$r$		$\frac{1}{2}$		$\frac{1}{2}r$
Bike	$r + 3$		$\frac{1}{4}$		$\frac{1}{4}(r + 3)$

The equation will come from the fact that the distance from Katie Mae's home to her school is the same whether she is walking or riding her bike.

So we say:

$$\underbrace{\text{distance walked}} = \underbrace{\text{distance covered by bike}}$$

**Step 1: Translate into an equation.**

$$\frac{1}{2}r = \frac{1}{4}(r + 3)$$

**Step 2: Solve this equation.**

$$\frac{1}{2}r = \frac{1}{4}(r + 3)$$

**Step 3: Clear the fractions by multiplying by the LCD of all the fractions in the equation.**

$$8 \times \frac{1}{2}r = 8 \times \frac{1}{4}(r + 3)$$

**Step 4: Simplify.**

$$4r = 2(r + 3)$$

$$4r = 2r + 6$$

$$2r = 6$$

$$r = 3 \text{ mph}$$

3 mph is Katie Mae's walking speed

$r + 3$  biking speed

$$3 + 3$$

6 mph (Katie Mae's biking speed)

**Step 5: Let's check if this works.**

$$\text{Walk} \quad 3 \text{ mph}(0.5 \text{ hours}) = 1.5 \text{ miles}$$

$$\text{Bike} \quad 6 \text{ mph}(0.25 \text{ hour}) = 1.5 \text{ miles}$$

Yes, either way Katie Mae travels 1.5 miles to school.

Katie Mae's walking speed is 3 mph.

Her speed riding her bike is 6 mph.

## Try It

29) Suzy takes **50** minutes to hike uphill from the parking lot to the lookout tower. It takes her **30** minutes to hike back down to the parking lot. Her speed going downhill is **1.2** miles per hour faster than her speed going uphill. Find Suzy's uphill and downhill speeds.

### Solution

Uphill **1.8** mph, downhill three mph

30) Llewyn takes **45** minutes to drive his boat upstream from the dock to his favorite fishing spot. It takes him **30** minutes to drive the boat back downstream to the dock. The boat's speed going downstream is four miles per hour faster than its speed going upstream. Find the boat's upstream and downstream speeds.

### Solution

Upstream **8** mph, downstream **12** mph

In the distance, rate, and time formula, time represents the actual amount of elapsed time (in hours, minutes, etc.). If a problem gives us starting and ending times as clock times, we must find the elapsed time in order to use the formula.

## Example 3.8.13

Hamilton loves to travel to Las Vegas, **255** miles from his home in Orange County. On his last trip, he left his house at 2:00 pm. The first part of his trip was on congested city freeways. At 4:00 pm, the traffic cleared and he was able to drive through the desert at a speed **1.75** times faster than when he drove in the congested area. He arrived in Las Vegas at 6:30 pm. How fast was he driving during each part of his trip?

**Solution**

A diagram will help us model this trip.

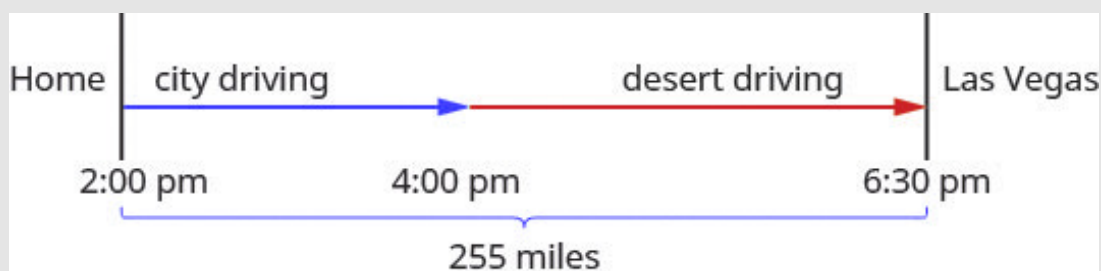

Figure 3.8.9

Next, we create a table to organize the information.

We know the total distance is **255** miles. We are looking for the rate of speed for each part of the trip. The rate in the desert is **1.75** times the rate in the city. If we let  $r$  = the rate in the city, then the rate in the desert is **1.75** $r$ .

The times here are given as clock times. Hamilton started from home at 2:00 pm and entered the desert at 4:30 pm. So he spent two hours driving the congested freeways in the city. Then he drove faster from 4:00 pm until 6:30 pm in the desert. So he drove **2.5** hours in the desert.

Now, we multiply the rates by the times.

	Rate (mph)	·	Time (hrs)	=	Distance (miles)
City	$r$		2		$2r$
Desert	$1.75r$		2.5		$2.5(1.5r)$
					225

By looking at the diagram below, we can see that the sum of the distance driven in the city and the distance driven in the desert is **255** miles.

$$\underbrace{\text{distance driven in the city}} + \underbrace{\text{distance driven in desert}} = 255$$

**Step 1: Translate into an equation.**

$$2r + 2.5(1.75r) = 255$$

**Step 2: Solve this equation.**

$$2r + 2.5(1.75r) = 255$$

$$2r + 4.375r = 255$$

$$6.375r = 255$$

$$r = 40 \text{ mph city}$$

$$1.75r \text{ desert speed}$$

$$1.75(40)$$

$$70 \text{ mph}$$

**Step 3: Check.**

$$\text{City } 40 \text{ mph (2 hours)} = 80 \text{ miles}$$

$$\text{Desert } 70 \text{ mph (2.5 hours)} = \frac{175 \text{ miles}}{255 \text{ miles}}$$

Hamilton drove 40 mph in the city and 70 mph in the desert.

## Try It

31) Cruz is training to compete in a triathlon. He left his house at 6:00 and ran until 7:30. Then he rode his bike until 9:45. He covered a total distance of 51 miles. His speed when biking was 1.6 times his speed when running. Find Cruz's biking and running speeds.

### Solution

Biking 16 mph, running 10 mph

32) Phuong left home on his bicycle at 10:00. He rode on the flat street until 11:15, then rode uphill until 11:45. He rode a total of 31 miles. His speed riding uphill was 0.6 times his speed on the flat street. Find his speed biking uphill and on the flat street.

### Solution

Uphill 12 mph, flat street 20 mph

## Key Concepts

- **Total Value of Coins** For the same type of coin, the total value of a number of coins is found by using the model.

- $\text{number} \times \text{value} = \text{total value}$  where *number* is the number of coins and *value* is the value of each coin; *total value* is the total value of all the coins

- **Problem-Solving Strategy—Coin Word Problems**

1. **Read the problem. Make all the words and ideas are understood. Determine the types of coins involved.**

- Create a table to organize the information.
- Label the columns type, number, value, total value.
- List the types of coins.
- Write in the value of each type of coin.
- Write in the total value of all the coins.

2. **Identify what we are looking for.**

3. **Name what we are looking for. Choose a variable to represent that quantity.**

Use variable expressions to represent the number of each type of coin and write them in the table.

Multiply the number times the value to get the total value of each type of coin.

4. **Translate into an equation. It may be helpful to restate the problem in one sentence with all the important information. Then, translate the sentence into an equation.**

Write the equation by adding the total values of all the types of coins.

5. **Solve the equation using good algebra techniques.**

6. **Check the answer in the problem and make sure it makes sense.**

7. **Answer the question with a complete sentence.**

- **Distance, Rate, and Time**

- $D = rt$  where  $D$  = distance,  $r$  = rate,  $t$  = time

### • Problem-Solving Strategy—Distance, Rate, and Time Applications

1. **Read the problem. Make sure all the words and ideas are understood.**

Draw a diagram to illustrate what is happening.

Create a table to organize the information: Label the columns rate, time, distance. List the two scenarios. Write in the information you know.

2. **Identify what we are looking for.**

3. **Name what we are looking for. Choose a variable to represent that quantity.**

Complete the chart.

Use variable expressions to represent that quantity in each row.

Multiply the rate times the time to get the distance.

4. **Translate into an equation.**

Restate the problem in one sentence with all the important information.

Then, translate the sentence into an equation.

5. **Solve the equation using good algebra techniques.**

6. **Check the answer in the problem and make sure it makes sense.**

7. **Answer the question with a complete sentence.**

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

An interactive H5P element has been excluded from this version of the text. You can view it online here:

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=1362#h5p-22>

After reviewing this checklist, what will you do to become confident for all objectives?

## Glossary

### **mixture problems**

Mixture problems combine two or more items with different values together.

## 3.9 GRAPH LINEAR EQUATIONS IN TWO VARIABLES

---

### Learning Objectives

By the end of this section, you will be able to:

- Plot points in a rectangular coordinate system
- Verify solutions to an equation in two variables
- Complete a table of solutions to a linear equation
- Find solutions to a linear equation in two variables
- Recognize the relationship between the solutions of an equation and its graph.
- Graph a linear equation by plotting points.
- Graph vertical and horizontal lines.
- Identify the  $x$ -intercept and  $y$ -intercept on a graph
- Find the  $x$ -intercept and  $y$ -intercept from an equation of a line
- Graph a line using the intercepts

### Try It

Before you get started, take this readiness quiz:

- 1) Evaluate  $x + 3$  when  $x = -1$ .

- 2) Evaluate  $2x - 5y$  when  $x = 3$  and  $y = -2$ .
- 3) Solve for  $y$ :  $40 - 4y = 20$ .
- 4) Evaluate  $3x + 2$  when  $x = -1$ .
- 5) Solve  $3x + 2y = 12$  for  $y$  in general.
- 6) Solve:  $3 \cdot 0 + 4y = -2$ .

## Plot Points on a Rectangular Coordinate System

Just like maps use a grid system to identify locations, a grid system is used in algebra to show a relationship between two variables in a **rectangular coordinate system**. The rectangular coordinate system is also called the  $xy$ -plane or the ‘coordinate plane’.

The horizontal number line is called the  $x$ -axis. The vertical number line is called the  $y$ -axis. The  $x$ -axis and the  $y$ -axis together form the rectangular coordinate system. These axes divide a plane into four regions, called **quadrants**. The quadrants are identified by Roman numerals, beginning on the upper right and proceeding counterclockwise. See Figure 3.9.1.

‘Quadrant’ has the root ‘quad,’ which means ‘four.’

Figure 3.9.1-‘Quadrant’ has the root ‘quad,’ which means ‘four.’

In the rectangular coordinate system, every point is represented by an **ordered pair**. The first number in the ordered pair is the  **$x$ -coordinate** of the point, and the second number is the  **$y$ -coordinate** of the point.

## Ordered Pair

An ordered pair,  $(x, y)$ , gives the coordinates of a point in a rectangular coordinate system.

Figure 3.9.2

The first number is the  $x$ -coordinate.

The second number is the  $y$ -coordinate.

The phrase ‘ordered pair’ means the order is important. What is the ordered pair of the point where the axes cross? At that point both coordinates are zero, so its ordered pair is  $(0, 0)$ . The point  $(0, 0)$  has a special name. It is called the **origin**.

## The Origin

The point  $(0, 0)$  is called the origin. It is the point where the  $x$ -axis and  $y$ -axis intersect.

We use the coordinates to locate a point on the  $xy$ -plane. Let’s plot the point  $(1, 3)$  as an example. First, locate 1 on the  $x$ -axis and lightly sketch a **vertical line** through  $x = 1$ . Then, locate 3 on the  $y$ -axis and sketch a **horizontal line** through  $y = 3$ . Now, find the point where these two lines meet—that is the point with coordinates  $(1, 3)$ .

Figure 3.9.3

Notice that the vertical line through  $x = 1$  and the horizontal line through  $y = 3$  are not part of the graph. We just used them to help us locate the point  $(1, 3)$ .

### Example 3.9.1

Plot each point in the rectangular coordinate system and identify the quadrant in which the point is located:

- a.  $(-5, 4)$
- b.  $(-3, -4)$
- c.  $(2, -3)$
- d.  $(-2, 3)$
- e.  $(3, \frac{5}{2})$

#### Solution

The first number of the coordinate pair is the  $x$ -coordinate, and the second number is the  $y$ -coordinate.

- a. Since  $x = -5$ , the point is to the left of the  $y$ -axis. Also, since  $y = 4$ , the point is above the  $x$ -axis. The point  $(-5, 4)$  is in Quadrant II.
- b. Since  $x = -3$ , the point is to the left of the  $y$ -axis. Also, since  $y = -4$ , the point is below the  $x$ -axis. The point  $(-3, -4)$  is in Quadrant III.
- c. Since  $x = 2$ , the point is to the right of the  $y$ -axis. Since  $y = -3$ , the point is below the  $x$ -axis. The point  $(2, -3)$  is in Quadrant IV.
- d. Since  $x = -2$ , the point is to the left of the  $y$ -axis. Since  $y = 3$ , the point is above the  $x$ -axis. The point  $(-2, 3)$  is in Quadrant II.
- e. Since  $x = 3$ , the point is to the right of the  $y$ -axis. Since  $y = \frac{5}{2}$ , the point is above the  $x$ -axis. (It may be helpful to write  $\frac{5}{2}$  as a mixed number or decimal.) The point  $(3, \frac{5}{2})$  is in Quadrant I.

Figure 3.9.4

## Try It

7) Plot each point in a rectangular coordinate system and identify the quadrant in which the point is located:

- a.  $(-2, 1)$
- b.  $(-3, -1)$
- c.  $(4, -4)$
- d.  $(-4, 4)$
- e.  $(-4, \frac{3}{2})$

### Solution

Figure 3.9.5

8) Plot each point in a rectangular coordinate system and identify the quadrant in which the point is located:

- a.  $(-4, 1)$
- b.  $(-2, 3)$
- c.  $(2, -5)$

d.  $(-2, 5)$

e.  $(-3, \frac{5}{2})$

**Solution**

Figure 3.9.6

How do the signs affect the location of the points? You may have noticed some patterns as you graphed the points in the previous example.

For the point in Figure 3.9.4 in Quadrant IV, what do you notice about the signs of the coordinates? What about the signs of the coordinates of points in the third quadrant? The second quadrant? The first quadrant?

Can you tell just by looking at the coordinates in which quadrant the point  $(-2, 5)$  is located? In which quadrant is  $(2, -5)$  located?

## Quadrants

We can summarize sign patterns of the quadrants in this way.

Quadrant I	Quadrant II	Quadrant III	Quadrant IV
$(x, y)$	$(x, y)$	$(x, y)$	$(x, y)$
$(+, +)$	$(-, +)$	$(-, -)$	$(+, -)$

Figure 3.9.7

What if one coordinate is zero as shown in Figure 3.9.8? Where is the point  $(0, 4)$  located? Where is the point  $(-2, 0)$  located?

Figure 3.9.8

The point  $(0, 4)$  is on the  $y$ -axis and the point  $(-2, 0)$  is on the  $x$ -axis.

### Points on the Axes

Points with a  $y$ -coordinate equal to  $0$  are on the  $x$ -axis, and have coordinates  $(a, 0)$ .

Points with an  $x$ -coordinate equal to  $0$  are on the  $y$ -axis, and have coordinates  $(0, b)$ .

### Example 3.9.2

Plot each point:

a.  $(0, 5)$

- b.  $(4, 0)$
- c.  $(-3, 0)$
- d.  $(0, 0)$
- e.  $(0, -1)$

**Solution**

- a. Since  $x = 0$ , the point whose coordinates are  $(0, 5)$  is on the  $y$ -axis.
- b. Since  $y = 0$ , the point whose coordinates are  $(4, 0)$  is on the  $x$ -axis.
- c. Since  $y = 0$ , the point whose coordinates are  $(-3, 0)$  is on the  $x$ -axis.
- d. Since  $x = 0$  and  $y = 0$ , the point whose coordinates are  $(0, 0)$  is the origin.
- e. Since  $x = 0$ , the point whose coordinates are  $(0, -1)$  is on the  $y$ -axis.

Figure 3.9.9

## Try It

9) Plot each point:

- a.  $(4, 0)$
- b.  $(-2, 0)$
- c.  $(0, 0)$
- d.  $(0, 2)$
- e.  $(0, -3)$

**Solution**

Figure 3.9.10

10) Plot each point:

- a.  $(-5, 0)$
- b.  $(3, 0)$
- c.  $(0, 0)$
- d.  $(0, -1)$
- e.  $(0, 4)$

**Solution**

Figure 3.9.11

In algebra, being able to identify the coordinates of a point shown on a graph is just as important as being able to plot points. To identify the  $x$ -coordinate of a point on a graph, read the number on the  $x$ -axis directly above or below the point. To identify the  $y$ -coordinate of a point, read the number on the  $y$ -axis directly to the left or right of the point. Remember, when you write the ordered pair use the correct order,  $(x, y)$ .

### Example 3.9.3

Name the ordered pair of each point shown in the rectangular coordinate system.

Figure 3.9.12

**Solution**

Point A is above  $-3$  on the  $x$ -axis, so the  $x$ -coordinate of the point is  $-3$ .

- The point is to the left of  $3$  on the  $y$ -axis, so the  $y$ -coordinate of the point is  $3$ .
- The coordinates of the point are  $(-3, 3)$ .

Point B is below  $-1$  on the  $x$ -axis, so the  $x$ -coordinate of the point is  $-1$ .

- The point is to the left of  $-3$  on the  $y$ -axis, so the  $y$ -coordinate of the point is  $-3$ .
- The coordinates of the point are  $(-1, -3)$ .

Point C is above  $2$  on the  $x$ -axis, so the  $x$ -coordinate of the point is  $2$ .

- The point is to the right of  $4$  on the  $y$ -axis, so the  $y$ -coordinate of the point is  $4$ .
- The coordinates of the point are  $(2, 4)$ .

Point D is below  $4$  on the  $x$ -axis, so the  $x$ -coordinate of the point is  $4$ .

- The point is to the right of  $-4$  on the  $y$ -axis, so the  $y$ -coordinate of the point is  $-4$ .
- The coordinates of the point are  $(4, -4)$ .

Point E is on the  $y$ -axis at  $y = -2$ . The coordinates of point E are  $(0, -2)$ .

Point F is on the  $x$ -axis at  $x = 3$ . The coordinates of point F are  $(3, 0)$ .

## Try It

11) Name the ordered pair of each point shown in the rectangular coordinate system.

Figure 3.9.13

### Solution

- a:  $(5, 1)$
- b:  $(-2, 4)$
- c:  $(-5, -1)$
- d:  $(3, -2)$
- e:  $(0, -5)$
- f:  $(4, 0)$

12) Name the ordered pair of each point shown in the rectangular coordinate system.

Figure 3.9.14

**Solution**a:  $(4, 2)$ b:  $(-2, 3)$ c:  $(-4, -4)$ d:  $(3, -5)$ e:  $(-3, 0)$ f:  $(0, 2)$ 

## Verify Solutions to an Equation in Two Variables

Up to now, all the equations you have solved were equations with just one variable. In almost every case, when you solved the equation you got exactly one solution. The process of solving an equation ended with a statement like  $x = 4$ . (Then, you checked the solution by substituting back into the equation.)

Here's an example of an equation in one variable, and its one solution.

$$3x + 5 = 17$$

$$3x = 12$$

$$x = 4$$

But equations can have more than one variable. Equations with two variables may be of the form  $Ax + By = C$ . Equations of this form are called **linear equations** in two variables.

## Linear Equation

An equation of the form  $Ax + By = C$ , where  $A$  and  $B$  are not both zero, is called a linear equation *in two variables*.

Notice the word *line* in *linear*. Here is an example of a linear equation in two variables,  $x$  and  $y$ .

$$\begin{aligned} Ax + By &= C \\ x + 4y &= 8 \\ A=1, B=4, C=8 \end{aligned}$$

The equation  $y = -3x + 5$  is also a linear equation. But it does not appear to be in the form  $Ax + By = C$ . We can use the Addition Property of Equality and rewrite it in  $Ax + By = C$  form.

Step 1: Add to both sides.

Step 2: Simplify.

Step 3: Use the Commutative Property to put it in  $Ax + By = C$  form.

$$\begin{aligned} y &= -3x + 5 \\ y + 3x &= -3x + 5 + 3x \\ y + 3x &= 5 \\ 3x + y &= 5 \end{aligned}$$

By rewriting  $y = -3x + 5$  as  $3x + y = 5$ , we can easily see that it is a linear equation in two variables because it is of the form  $Ax + By = C$ . When an equation is in the form  $Ax + By = C$ , we say it is in *standard form*.

### Standard Form of Linear Equation

A linear equation is in standard form when it is written  $Ax + By = C$ .

Most people prefer to have  $A$ ,  $B$ , and  $C$  be integers and  $A \geq 0$  when writing a linear equation in standard form, although it is not strictly necessary.

Linear equations have infinitely many solutions. For every number that is substituted for  $x$  there is a corresponding  $y$  value. This pair of values is a *solution* to the linear equation and is represented by the ordered pair  $(x, y)$ . When we substitute these values of  $x$  and  $y$  into the equation, the result is a true statement, because the value on the left side is equal to the value on the right side.

## Solution of a Linear Equation in Two Variables

An ordered pair  $(x, y)$  is a *solution* of the linear equation  $Ax + By = C$ , if the equation is a true statement when the  $x$  and  $y$  values of the ordered pair are substituted into the equation.

### Example 3.9.4

Determine which ordered pairs are solutions to the equation  $x + 4y = 8$ .

- a.  $(0, 2)$
- b.  $(2, -4)$
- c.  $(-4, 3)$

#### Solution

Substitute the  $x$ - and  $y$ -values from each ordered pair into the equation and determine if the result is a true statement.

(a)	(b)	(c)
$(0, 2)$	$(2, -4)$	$(-4, 3)$
$x = 0, y = 2$	$x = 2, y = -4$	$x = -4, y = 3$
$x + 4y = 8$	$x + 4y = 8$	$x + 4y = 8$
$0 + 4 \cdot 2 \stackrel{?}{=} 8$	$2 + 4 \cdot -4 \stackrel{?}{=} 8$	$-4 + 4 \cdot 3 \stackrel{?}{=} 8$
$0 + 8 \stackrel{?}{=} 8$	$2 + (-16) \stackrel{?}{=} 8$	$-4 + 12 \stackrel{?}{=} 8$
$8 = 8 \checkmark$	$-14 \neq 8$	$8 = 8 \checkmark$
$(0, 2)$ is a solution	$(2, -4)$ is not a solution	$(-4, 3)$ is a solution

## Try It

13) Which of the following ordered pairs are solutions to  $2x + 3y = 6$ ?

- a.  $(3, 0)$
- b.  $(2, 0)$
- c.  $(6, -2)$

**Solution**

a, c

14) Which of the following ordered pairs are solutions to the equation  $4x - y = 8$ ?

- a.  $(0, 8)$
- b.  $(2, 0)$
- c.  $(1, -4)$

**Solution**

b, c

## Example 3.9.5

Which of the following ordered pairs are solutions to the equation  $y = 5x - 1$ ?

- b.  $(1, 4)$
- c.  $(-2, -7)$

**Solution**

Substitute the  $x$  and  $y$  values from each ordered pair into the equation and determine if it results in a true statement.

(a)	(b)	(c)
$(0, -1)$	$(1, 4)$	$(-2, -7)$
$x = 0, y = -1$	$x = 1, y = 4$	$x = -2, y = -7$
$y = 5x - 1$	$y = 5x - 1$	$y = 5x - 1$
$-1 \stackrel{?}{=} 5(0) - 1$	$4 \stackrel{?}{=} 5(1) - 1$	$-7 \stackrel{?}{=} 5(-2) - 1$
$-1 \stackrel{?}{=} 0 - 1$	$4 \stackrel{?}{=} 5 - 1$	$-7 \stackrel{?}{=} -10 - 1$
$-1 = -1 \checkmark$	$4 = 4 \checkmark$	$7 \neq -11$
$(0, -1)$ is a solution.	$(1, 4)$ is a solution.	$(-2, -7)$ is not a solution.

## Try It

15) Which of the following ordered pairs are solutions to the equation  $y = 4x - 3$ ?

- a.  $(0, 3)$
- b.  $(1, 1)$
- c.  $(-1, -1)$

### Solution

b

16) Which of the following ordered pairs are solutions to the equation  $y = -2x + 6$ ?

- a.  $(0, 6)$
- b.  $(1, 4)$
- c.  $(-2, -2)$

### Solution

a, b

## Complete a Table of Solutions to a Linear Equation in Two Variables

In the examples above, we substituted the  $x$  and  $y$  values of a given ordered pair to determine whether or not it was a solution to a linear equation. But how do you find the ordered pairs if they are not given? It's easier than you might think—you can just pick a value for  $x$  and then solve the equation for  $y$ . Or, pick a value for  $y$  and then solve for  $x$ .

We'll start by looking at the solutions to the equation  $y = 5x - 1$  that we found in Example 3.9.5. We can summarize this information in a table of solutions, as shown in the below table.

$y = 5x - 1$		
$x$	$y$	$(x, y)$
0	-1	$(0, -1)$
1	4	$(1, 4)$

To find a third solution, we'll let  $x = 2$  and solve for  $y$ .

$$\begin{array}{lcl}
 & & y = 5x - 1 \\
 \text{Substitute } x = 2. & & y = 5(2) - 1 \\
 \text{Multiply.} & & y = 10 - 1 \\
 \text{Simplify.} & & y = 9
 \end{array}$$

The ordered pair  $(2, 9)$  is a solution to  $y = 5x - 1$ . We will add it to below table.

$y = 5x - 1$		
$x$	$y$	$(x, y)$
0	-1	$(0, -1)$
1	4	$(1, 4)$
2	9	$(2, 9)$

We can find more solutions to the equation by substituting in any value of  $x$  or any value of  $y$  and solving the resulting equation to get another ordered pair that is a solution. There are infinitely many solutions of this equation.

Example 3.9.6

Complete below table to find three solutions to the equation  $y = 4x - 2$ .

$y = 4x - 2$		
$x$	$y$	$(x, y)$
0		
-1		
2		

Solution

Substitute  $x = 0$ ,  $x = -1$ , and  $x = 2$  into  $y = 4x - 2$

$x = 0$	$x = -1$	$x = 2$
$y = 4x - 2$	$y = 4x - 2$	$y = 4x - 2$
$y = 4 \cdot 0 - 2$	$y = 4(-1) - 2$	$y = 4 \cdot 2 - 2$
$y = -2$	$y = -4 - 2$	$y = 8 - 2$
$y = -2$	$y = -6$	$y = 6$
$(0, -2)$	$(-1, -6)$	$(2, 6)$

The results are summarized in below table.

$y = 4x - 2$		
$x$	$y$	$(x, y)$
0	-2	$(0, -2)$
-1	-6	$(-1, -6)$
2	6	$(2, 6)$

## Try It

17) Complete the table to find three solutions to this equation:  $y = 3x - 1$ .

$y = 3x - 1$		
$x$	$y$	$(x, y)$
0		
-1		
2		

### Solution

$y = 3x - 1$		
$x$	$y$	$(x, y)$
0	-1	$(0, -1)$
-1	-4	$(-1, -4)$
2	5	$(2, 5)$

18) Complete the table to find three solutions to this equation:  $y = 6x + 1$ .

$y = 6x + 1$		
$x$	$y$	$(x, y)$
0		
-1		
2		

### Solution

$y = 6x - 1$		
$x$	$y$	$(x, y)$
0	1	$(0, -1)$
-1	7	$(1, 7)$
2	-11	$(2, -11)$

### Example 3.9.7

Complete the below table to find three solutions to the equation  $5x - 4y = 20$ .

$5x - 4y = 20$		
$x$	$y$	$(x, y)$
0		
	0	
	5	

#### Solution

Substitute the given value into the equation  $5x - 4y = 20$  and solve for the other variable. Then, fill in the values in the table.

$x = 0$ 
$$5x - 4y = 20 - 2$$
$$5 \cdot 0 = 20$$
$$0 - 4y = 20$$
$$-4y = 20$$
$$y = -5$$
$$(0, -5)$$

$y = 0$ 
$$5x - 4y = 20$$
$$5x - 4 \cdot 0 = 20$$
$$5x - 0 = 20$$
$$5x = 20$$
$$x = 4$$
$$(4, 0)$$

$y = 5$ 
$$5x - 4y = 20$$
$$5x - 4 \cdot 5 = 20$$
$$5x - 20 = 20$$
$$5x = 40$$
$$x = 8$$
$$(8, 5)$$

The results are summarized in the below table.

$5x - 4y = 20$		
$x$	$y$	$(x, y)$
0	-5	$(0, -5)$
4	0	$(4, 0)$
8	5	$(8, 5)$

Try It

19) Complete the table to find three solutions to this equation:  $2x - 5y = 20$ .

$2x - 5y = 20$		
$x$	$y$	$(x, y)$
0		
	0	
-5		

**Solution**

$2x - 5y = 20$		
$x$	$y$	$(x, y)$
0	-4	$(0, -4)$
10	0	$(10, 0)$
-5	-6	$(-5, -6)$

20) Complete the table to find three solutions to this equation:  $3x - 4y = 12$ .

$3x - 4y = 12$		
$x$	$y$	$(x, y)$
0		
	0	
-4		

**Solution**

$3x - 4y = 12$		
$x$	$y$	$(x, y)$
0	-3	$(0, -3)$
4	0	$(4, 0)$
-4	-6	$(-4, -6)$

## Find Solutions to a Linear Equation

To find a solution to a linear equation, you really can pick *any* number you want to substitute into the equation for  $x$  or  $y$ . But since you'll need to use that number to solve for the other variable it's a good idea to choose a number that's easy to work with.

When the equation is in  $y$ -form, with the  $y$  by itself on one side of the equation, it is usually easier to choose values of  $x$  and then solve for  $y$ .

### Example 3.9.8

Find three solutions to the equation  $y = -3x + 2$ .

#### Solution

We can substitute any value we want for  $x$  or any value for  $y$ . Since the equation is in  $y$ -form, it will be easier to substitute in values of  $x$ .

Let's pick  $x = 0$ ,  $x = 1$ , and  $x = -1$ .

---

$$x = 0$$

$$y = -3x + 2$$

---

---

$$x = 1$$

$$y = -3x + 2$$

---

---

$$x = -1$$

$$y = -3x + 2$$

---

**Step 1: Substitute the value into the equation.**

---

$$y = -3 \times 0 + 2$$

$$y = -3 \times 1 + 2$$

$$y = -3 \times (-1) + 2$$

---

**Step 2: Simplify.**

---

$$y = 0 + 2$$

$$y = -3 + 2$$

$$y = 3 + 2$$

---

**Step 3: Simplify.**

---

$$y = 2$$

$$y = -1$$

$$y = 5$$

---

**Step 4: Write the ordered pair.**

---

$$(0, 2)$$

$$(1, -1)$$

$$(-1, 5)$$

---

**Step 5: Check.**

$$y = -3x + 2$$

$$2 \stackrel{?}{=} -3(0) + 2$$

$$2 = 2 \checkmark$$

$$y = -3x + 2$$

$$-1 \stackrel{?}{=} -3(1) + 2$$

$$-1 = -1 \checkmark$$

$$y = -3x + 2$$

$$5 \stackrel{?}{=} -3(-1) + 2$$

$$5 = 5 \checkmark$$

So,  $(0, 2)$ ,  $(1, -1)$  and  $(-1, 5)$  are all solutions to  $y = -3x + 2$ . We show them in the below table.

$y = -3x + 2$		
$x$	$y$	$(x, y)$
0	2	$(0, 2)$
1	-1	$(1, -1)$
-1	5	$(-1, 5)$

## Try It

21) Find three solutions to this equation:  $y = -2x + 3$ .

### Solution

Answers will vary.

22) Find three solutions to this equation:  $y = -4x + 1$ .

### Solution

Answers will vary.

We have seen how using zero as one value of  $x$  makes finding the value of  $y$  easy. When an equation is in standard form, with both the  $x$  and  $y$  on the same side of the equation, it is usually easier to first find one solution when  $x = 0$  find a second solution when  $y = 0$ , and then find a third solution.

**Example 3.9.9**

Find three solutions to the equation  $3x + 2y = 6$ .

**Solution**

We can substitute any value we want for  $x$  or any value for  $y$ . Since the equation is in standard form, let's pick first  $x = 0$ , then  $y = 0$ , and then find a third point.

---

 $x = 0$

$y = 0$

$x = 1$ 

---

**Step 1: Substitute the value into the equation.**

---

 $3x + 2y = 6$

$3x + 2y = 6$

$3x + 2y = 6$ 

---

**Step 2: Simplify.**

---

 $3(0) + 2y = 6$

$3x + 2(0) = 6$

$3(1) + 2y = 6$ 

---

**Step 3: Solve.**

---

$$\begin{aligned} 0 + 2y &= 6 \\ 2y &= 6 \\ y &= 3 \end{aligned}$$

$$\begin{aligned} 3x + 0 &= 6 \\ 3x &= 6 \\ x &= 2 \end{aligned}$$

$$\begin{aligned} 3 + 2y &= 6 \\ 2y &= 3 \\ y &= \frac{3}{2} \end{aligned}$$

---

**Step 4: Write the ordered pair.**

---

 $(0, 3)$

$(2, 0)$

$(1, \frac{3}{2})$ 

---

**Step 5: Check.**

---

$3x + 2y = 6$	$3x + 2y = 6$	$3x + 2y = 6$
$3(0) + 2(3) \stackrel{?}{=} 6$	$3(2) + 2(0) \stackrel{?}{=} 6$	$3(1) + 2(\frac{3}{2}) \stackrel{?}{=} 6$
$0 + 6 = 6$	$6 + 0 = 6$	$3 + 3 \stackrel{?}{=} 6$
$6 = 6 \checkmark$	$6 = 6 \checkmark$	$6 = 6 \checkmark$

---

So  $(0, 3)$ ,  $(2, 0)$ , and  $(1, \frac{3}{2})$  are all solutions to the equation  $3x + 2y = 6$ . We can list these three solutions in below table.

$3x + 2y = 6$		
$x$	$y$	$(x, y)$
0	3	$(0, 3)$
2	0	$(2, 0)$
1	$\frac{3}{2}$	$(1, \frac{3}{2})$

## Try It

23) Find three solutions to the equation  $2x + 3y = 6$ .

### Solution

Answers will vary.

24) Find three solutions to the equation  $4x + 2y = 8$ .

### Solution

Answers will vary.

## Recognize the Relationship Between the Solutions of an Equation and its Graph

In the previous section, we found several solutions to the equation  $3x + 2y = 6$ . They are listed in the table below. So, the ordered pairs  $(0, 3)$ ,  $(2, 0)$ , and  $(1, \frac{3}{2})$  are some solutions to the equation  $3x + 2y = 6$ .

We can plot these solutions in the rectangular coordinate system as shown in the below table.

$3x + 2y = 6$		
$x$	$y$	$(x, y)$
0	3	$(0, 3)$
2	0	$(2, 0)$
1	$\frac{3}{2}$	$(1, \frac{3}{2})$

Figure 3.9.15

Notice how the points line up perfectly? We connect the points with a line to get the graph of the equation  $3x + 2y = 6$ . See Figure 3.9.16. Notice the arrows on the ends of each side of the line. These arrows indicate the line continues.

Figure 3.9.16

Every point on the line is a solution of the equation. Also, every solution of this equation is a point on this line. Points *not* on the line are not solutions.

Notice that the point whose coordinates are  $(-2, 6)$  is on the line shown in Figure 3.9.17. If you substitute  $x = -2$  and  $y = 6$  into the equation, you find that it is a solution to the equation.

Figure 3.9.17

Test( $-2, 6$ )

$$3x + 2y = 6$$

$$3(-2) + 2(6) = 6$$

$$-6 + 12 = 6$$

$$6 = 6 \checkmark$$

So the point  $(-2, 6)$  is a solution to the equation  $3x + 2y = 6$ . (The phrase “the point whose coordinates are  $(-2, 6)$ ” is often shortened to “the point  $(-2, 6)$ .”)

What about( $4, 1$ )

$$3x + 2y = 6$$

$$3(4) + 2(1) = 6$$

$$12 + 2 \stackrel{?}{=} 6$$

$$14 \neq 6 \checkmark$$

So  $(4, 1)$  is not a solution to the equation  $3x + 2y = 6$ . Therefore, the point  $(4, 1)$  is not on the line. See Figure 3.9.17. This is an example of the saying, “A picture is worth a thousand words.” The line shows you *all* the solutions to the equation. Every point on the line is a solution of the equation. And, every solution of this equation is on this line. This line is called the *graph* of the equation  $3x + 2y = 6$ .

## Graph of a Linear Equation

The **graph of a linear equation**  $Ax + By = C$  is a line.

- Every point on the line is a solution of the equation.
- Every solution of this equation is a point on this line.

### Example 3.9.10

The graph of  $y = 2x - 3$  is shown.

Figure 3.9.18

For each ordered pair, decide:

- a. Is the ordered pair a solution to the equation?
  - b. Is the point on the line?
- a.  $(0, -3)$   
b.  $(3, 3)$   
c.  $(2, -3)$   
d.  $(-1, -5)$

**Solution**

Substitute the  $x$ - and  $y$ - values into the equation to check if the ordered pair is a solution to the equation.

a.

A:	B:	C:	D:
$(0, -3)$	$(3, 3)$	$(2, -3)$	$(-1, -5)$
$y = 2x - 3$	$y = 2x - 3$	$y = 2x - 3$	$y = 2x - 3$
$-3 \stackrel{?}{=} 2(0) - 3$	$3 \stackrel{?}{=} 2(3) - 3$	$-3 \stackrel{?}{=} 2(2) - 3$	$-5 \stackrel{?}{=} 2(-1) - 3$
$-3 = -3 \checkmark$	$3 = 3 \checkmark$	$-3 \neq 1$	$-5 = -5 \checkmark$
$(0, -3)$ is a solution.	$(3, 3)$ is a solution	$(2, -3)$ is not a solution	$(-1, -5)$ is a solution

b. Plot the points A  $(0, 3)$ , B  $(3, 3)$ , C  $(2, -3)$ , and D  $(-1, -5)$ .

The points  $(0, 3)$ ,  $(3, 3)$ , and  $(-1, -5)$  are on the line  $y = 2x - 3$ , and the point  $(2, -3)$  is not on the line.

The points that are solutions to  $y = 2x - 3$  are on the line, but the point that is not a solution is not on the line.

## Try It

25) Use the graph of  $y = 3x - 1$  to decide whether each ordered pair is:

- a solution to the equation.
- on the line.

a.  $(0, -1)$

b.  $(2, 5)$

Figure 3.9.19

**Solution**

- a. yes, yes
- b. yes, yes

26) Use graph of  $y = 3x - 1$  to decide whether each ordered pair is:

- a solution to the equation
- on the line

a.  $(3, -1)$

b.  $(-1, -4)$

Figure 3.9.20

**Solution**

- a. no, no
- b. yes, yes

## Graph a Linear Equation by Plotting Points

There are several methods that can be used to graph a linear equation. The method we used to graph  $3x + 2y = 6$  is called plotting points, or the Point-Plotting Method.

### Example 3.9.11

Graph the equation  $y = 2x + 1$  by plotting points.

**Solution**

**Step 1:** Find three points whose coordinates are solutions to the equation.

You can choose any values for  $x$  or  $y$ .

In this case, since  $y$  is isolated on the left side of the equation, it is easier to choose values for  $x$ .

$$y = 2x + 1$$

$$x = 0$$

$$y = 2x + 1$$

$$y = 2 \cdot 0 + 1$$

$$y = 0 + 1$$

$$y = 1$$

$$x = 1$$

$$y = 2x + 1$$

$$y = 2 \cdot 1 + 1$$

$$y = 2 + 1$$

$$y = 3$$

$$x = -2$$

$$y = 2x + 1$$

$$y = 2 \cdot -2 + 1$$

$$y = -4 + 1$$

$$y = -3$$

Organize the solutions in a table.

Put the three solutions in a table.

$y=2x+1$		
$x$	$y$	$(x,y)$
0	1	(0,1)
1	3	(1,3)
-2	-3	(-2,-3)

**Step 2: Plot the points in a rectangular coordinate system.**

Plot: (0,1), (1, 3), (-2,-3).

Figure 3.9.21

Check that the points line up. If they do not, carefully check your work!

Do the points line up? Yes, the points line up.

**Step 3: Draw the line through the three points. Extend the line to fill the grid and put arrows on both ends of the line.**

This line is the graph of  $y = 2x + 1$ .

Figure 3.9.22

## Try It

27) Graph the equation by plotting points:  $y = 2x - 3$ .

**Solution**

Figure 3.9.23

28) Graph the equation by plotting points:  $y = -2x + 4$ .

**Solution**

Figure 3.9.24

The steps to take when graphing a linear equation by plotting points are summarized below.

## HOW TO

### Graph a linear equation by plotting points.

1. Find three points whose coordinates are solutions to the equation. Organize them in a table.
2. Plot the points in a rectangular coordinate system. Check that the points line up. If they do not, carefully check your work.
3. Draw the line through the three points. Extend the line to fill the grid and put arrows on both ends of the line.

It is true that it only takes two points to determine a line, but it is a good habit to use three points. If you only plot two points and one of them is incorrect, you can still draw a line but it will not represent the solutions to the equation. It will be the wrong line.

If you use three points, and one is incorrect, the points will not line up. This tells you something is wrong and you need to check your work. Look at the difference between part (a) and part (b) in Figure 3.9.25.

Figure 3.9.25

Let's do another example. This time, we'll show the last two steps all on one grid.

Example 3.9.12

Graph the equation  $y = -3x$ .

Solution

**Step 1: Find three points that are solutions to the equation.**

Here, again, it's easier to choose values for  $x$ . Do you see why?

$x = 0$	$x = 1$	$x = -2$
$y = -3x$	$y = -3$	$y = -3$
$y = -3 \cdot 0$	$y = -3 \cdot 1$	$y = -3(-2)$
$y = 0$	$y = -3$	$y = 6$

**Step 2: List the points in the following table.**

$y = -3x$		
$x$	$y$	$(x, y)$
0	0	$(0, 0)$
1	-3	$(1, -3)$
-2	6	$(-2, 6)$

**Step 3: Plot the points, check that they line up, and draw the line.**

Figure 3.9.26

## Try It

29) Graph the equation by plotting points:  $y = -4x$ .

**Solution**

Figure 3.9.27

30) Graph the equation by plotting points:  $y = x$ .

**Solution**

Figure 3.9.28

When an equation includes a fraction as the coefficient of  $x$ , we can still substitute any numbers for  $x$ . But the math is easier if we make ‘good’ choices for the values of  $x$ . This way we will avoid fraction answers, which are hard to graph precisely.

**Example 3.9.13**

Graph the equation  $y = \frac{1}{2}x + 3$

**Solution**

**Step 1: Find three points that are solutions to the equation.**

Since this equation has the fraction  $\frac{1}{2}$  as a coefficient of  $x$ , we will choose values of  $x$  carefully. We will use zero as one choice and multiples of 2 for the other choices. Why are multiples of 2 a good choice for values of  $x$ ?

$$x = 0$$

$$y = \frac{1}{2}x + 3$$

$$y = \frac{1}{2}(0) + 3$$

$$y = 0 + 3$$

$$y = 3$$

$$x = 2$$

$$y = \frac{1}{2}x + 3$$

$$y = \frac{1}{2}(2) + 3$$

$$y = 1 + 3$$

$$y = 4$$

$$x = 4$$

$$y = \frac{1}{2}x + 3$$

$$y = \frac{1}{2}(4) + 3$$

$$y = 2 + 3$$

$$y = 5$$

The points are shown in the below table.

$y = \frac{1}{2}x + 3$		
$x$	$y$	$(x, y)$
0	3	(0, 3)
2	4	(2, 4)
4	5	(4, 5)

**Step 2: Plot the points, check that they line up, and draw the line.**

Figure 3.9.29

## Try It

31) Graph the equation  $y = \frac{1}{3}x - 1$

**Solution**

Figure 3.9.30

32) Graph the equation  $y = \frac{1}{4}x + 2$ .

**Solution**

Figure 3.9.31

So far, all the equations we graphed had  $y$  given in terms of  $x$ . Now we'll graph an equation with  $x$  and  $y$  on the same side. Let's see what happens in the equation  $2x + y = 3$ . If  $y = 0$  what is the value of  $x$ ?

$$\begin{aligned}y &= 0 \\2x + y &= 3 \\2x + 0 &= 3 \\2x &= 3 \\x &= \frac{3}{2} \\&\left(\frac{3}{2}, 0\right)\end{aligned}$$

This point has a fraction for the  $x$ -coordinate and, while we could graph this point, it is hard to be precise graphing fractions. Remember in the example  $y = \frac{1}{2}x + 3$ , we carefully chose values for  $x$  so as not to graph fractions at all. If we solve the equation  $2x + y = 3$  for  $y$ , it will be easier to find three solutions to the equation.

$$\begin{aligned}2x + y &= 3 \\y &= -2x + 3\end{aligned}$$

The solutions for  $x = 0$ ,  $x = 1$ , and  $x = -1$  are shown in the below table. The graph is shown in the Figure 3.9.32.

$2x + y = 3$		
$x$	$y$	$(x, y)$
0	3	$(0, 3)$
1	1	$(1, 1)$
-1	5	$(-1, 5)$

Figure 3.9.32

Can you locate the point  $(\frac{3}{2}, 0)$ , which we found by letting  $y = 0$ , on the line?

### Example 3.9.14

Graph the equation  $3x + y = -1$ .

**Solution**

**Step 1:** Find three points that are solutions to the equation.

$$3x + y = -1$$

**Step 2:** First, solve the equation for  $y$ .

$$y = -3x - 1$$

**Step 3:** We'll let  $x$  be 0, 1, and  $-1$  to find 3 points.

The ordered pairs are shown in the below table. Plot the points, check that they line up, and draw the line. See Figure 3.9.33.

$3x + y = -1$		
$x$	$y$	$(x, y)$
0	-1	$(0, -1)$
1	-4	$(1, -4)$
-1	2	$(-1, 2)$

Figure 3.9.33

## Try It

33) Graph the equation  $2x + y = 2$ .

**Solution**

Figure 3.9.34

34) Graph the equation  $4x + y = -3$ .

**Solution**

Figure 3.9.35

If you can choose any three points to graph a line, how will you know if your graph matches the one shown in the answers in the book? If the points where the graphs cross the  $x$ - and  $y$ -axis are the same, the graphs match!

The equation in Example 3.9.14, was written in standard form, with both  $x$  and  $y$  on the same side. We solved that equation for  $y$  in just one step. But for other equations in standard form it is not that easy to solve for  $y$ , so we will leave them in standard form. We can still find a first point to plot by letting  $x = 0$  and solving for  $y$

. We can plot a second point by letting  $y = 0$  and then solving for  $x$ . Then we will plot a third point by using some other value for  $x$  or  $y$ .

### Example 3.9.15

Graph the equation  $2x - 3y = 6$

**Solution**

**Step 1:** Find three points that are solutions to the equation.

$$2x - 3y = 6$$

**Step 2:** First, let  $x = 0$ .

$$2(0) - 3y = 6$$

**Step 3:** Solve for  $y$ .

$$\begin{aligned} -3y &= 6 \\ y &= -2 \end{aligned}$$

**Step 4:** Now let  $y = 0$ .

$$2x - 3(0) = 6$$

**Step 5:** Solve for  $x$ .

$$\begin{aligned} 2x &= 6 \\ x &= 3 \end{aligned}$$

**Step 6:** We need a third point. Remember, we can choose any value for  $x$  or  $y$ . We'll let  $x = 6$ .

$$2(6) - 3y = 6$$

**Step 7:** Solve for  $y$ .

$$\begin{aligned} 12 - 3y &= 6 \\ -3y &= -6 \\ y &= 2 \end{aligned}$$

We list the ordered pairs in the below table. Plot the points, check that they line up, and draw the line. See Figure 3.9.36

$2x - 3y = 6$		
$x$	$y$	$(x, y)$
0	-2	$(0, -2)$
3	0	$(3, 0)$
6	2	$(6, 2)$

3.9.36

## Try It

35) Graph the equation  $4x + 2y = 8$ .

**Solution**

Figure 3.9.37

36) Graph the equation  $2x - 4y = 8$ .

**Solution**

Figure 3.9.38

## Graph Vertical and Horizontal Lines

Can we graph an equation with only one variable? Just  $x$  and no  $y$ , or just  $y$  without an  $x$ ? How will we make a table of values to get the points to plot?

Let's consider the equation  $x = -3$ . This equation has only one variable,  $x$ . The equation says that  $x$  is *always* equal to  $-3$ , so its value does not depend on  $y$ . No matter what  $y$  is, the value of  $x$  is always  $-3$ .

So to make a table of values, write  $-3$  in for all the  $x$  values. Then choose any values for  $y$ . Since  $x$  does not depend on  $y$ , you can choose any numbers you like. But to fit the points on our coordinate graph, we'll use 1, 2, and 3 for the  $y$ -coordinates. See the table below.

$x = -3$		
$x$	$y$	$(x, y)$
$-3$	1	$(-3, 1)$
$-3$	2	$(-3, 2)$
$-3$	3	$(-3, 3)$

Plot the points from the above table and connect them with a straight line. Notice in Figure 3.9.39 that we have graphed a vertical line.

Figure 3.9.39

## Vertical Line

A vertical line is the graph of an equation of the form  $x = a$ .

The line passes through the  $x$ -axis at  $(a, 0)$ .

### Example 3.9.16

Graph the equation  $x = 2$ .

#### Solution

The equation has only one variable,  $x$ , and  $x$  is always equal to  $2$ . We create the table below where  $x$  is

always **2** and then put in any values for ***y***. The graph is a vertical line passing through the ***x***-axis at **2**. See Figure 3.9.40.

$x = 2$		
$x$	$y$	$(x, y)$
2	1	(2, 1)
2	2	(2, 2)
2	3	(2, 3)

Figure 3.9.40

## Try It

37) Graph the equation  $x = 5$ .

**Solution**

Figure 3.9.41

38) Graph the equation  $x = -2$ .

**Solution**

Figure 3.9.42

What if the equation has  $y$  but no  $x$ ? Let's graph the equation  $y = 4$ . This time the  $y$ -value is a constant, so in this equation,  $y$  does not depend on  $x$ . Fill in 4 for all the  $y$ 's in the below table and then choose any values for  $x$ . We'll use 0, 2, and 4 for the  $x$ -coordinates.

$y = 4$		
$x$	$y$	$(x, y)$
0	4	$(0, 4)$
2	4	$(2, 4)$
4	4	$(4, 4)$

The graph is a horizontal line passing through the  $y$ -axis at 4. See Figure 3.9.43.

Figure 3.9.43

## Horizontal Line

A horizontal line is the graph of an equation of the form  $y = b$ .

The line passes through the  $y$ -axis at  $(0, b)$ .

### Example 3.9.17

Graph the equation  $y = -1$

#### Solution

The equation  $y = -1$  has only one variable,  $y$ . The value of  $y$  is constant. All the ordered pairs in the below

table have the same  $y$ -coordinate. The graph is a horizontal line passing through the  $y$ -axis at  $-1$ , as shown in Figure 3.9.44.

$y = -1$		
$x$	$y$	$(x, y)$
0	$-1$	$(0, -1)$
3	$-1$	$(3, -1)$
$-3$	$-1$	$(-3, -1)$

Figure 3.9.44

## Try It

39) Graph the equation  $y = -4$ .

**Solution**

Figure 3.9.45

40) Graph the equation  $y = 3$ .

**Solution**

Figure 3.9.46

The equations for vertical and horizontal lines look very similar to equations like  $y = 4x$ . What is the difference between the equations  $y = 4x$  and  $y = 4$ ?

The equation  $y = 4x$  has both  $x$  and  $y$ . The value of  $y$  depends on the value of  $x$ . The  $y$ -coordinate changes according to the value of  $x$ . The equation  $y = 4$  has only one variable. The value of  $y$  is constant. The  $y$ -coordinate is always 4. It does not depend on the value of  $x$ . See the table below.

$y = 4x$			$y = 4$		
$x$	$y$	$(x, y)$	$x$	$y$	$(x, y)$
0	0	$(0, 0)$	0	4	$(0, 4)$
1	4	$(1, 4)$	1	4	$(1, 4)$
2	8	$(2, 8)$	2	4	$(2, 4)$

Figure 3.9.47

Notice, in Figure 3.9.47, the equation  $y = 4x$  gives a slanted line, while  $y = 4$  gives a horizontal line.

### Example 3.9.18

Graph  $y = -3x$  and  $y = -3$  in the same rectangular coordinate system.

**Solution**

Notice that the first equation has the variable  $x$ , while the second does not. See the below table. The two graphs are shown in Figure 3.9.48.

$y = -3x$			$y = -3$		
$x$	$y$	$(x, y)$	$x$	$y$	$(x, y)$
0	0	$(0, 0)$	0	-3	$(0, -3)$
1	-3	$(1, -3)$	1	-3	$(1, -3)$
2	-6	$(2, -6)$	2	-3	$(2, -3)$

Figure 3.9.48

## Try It

41) Graph  $y = -4x$  and  $y = -4$  in the same rectangular coordinate system.

**Solution**

Figure 3.9.49

42) Graph  $y = 3$  and  $y = 3x$  in the same rectangular coordinate system.

**Solution**

Figure 3.9.50

## Intercepts on a Graph

Every linear equation can be represented by a unique line that shows all the solutions of the equation. We have seen that when graphing a line by plotting points, you can use any three solutions to graph. This means that two people graphing the line might use different sets of three points.

At first glance, their two lines might not appear to be the same, since they would have different points labelled. But if all the work was done correctly, the lines should be exactly the same. One way to recognize that they are indeed the same line is to look at where the line crosses the  $x$ -axis and the  $y$ -axis. These points are called the **intercepts of the line**.

### Intercepts of a Line

The points where a line crosses the  $x$ -axis and the  $y$ -axis are called the intercepts of a line.

Let's look at the graphs of the lines in Figure 3.9.51.

Examples of graphs crossing the  $x$ -negative axis.

(a)  $2x + y = 6$ (b)  $3x - 4y = 12$ (c)  $x - y = 5$ (d)  $y = -2x$ 

Figure 3.9.51

First, notice where each of these lines crosses the  $x$  negative axis. See the table below.

Figure	The line crosses the $x$ -axis at:	Ordered pair of this point
Figure (a)	3	$(3, 0)$
Figure (b)	4	$(4, 0)$
Figure (c)	5	$(5, 0)$
Figure (d)	0	$(0, 0)$

Do you see a pattern?

For each row, the  $y$ -coordinate of the point where the line crosses the  $x$ -axis is zero. The point where the line crosses the  $x$ -axis has the form  $(a, 0)$  and is called the  **$x$ -intercept** of a line. The  $x$ -intercept occurs when  $y$  is zero.

Now, let's look at the points where these lines cross the  $y$ -axis. See the table below.

Figure	The line crosses the $y$ -axis at:	Ordered pair for this point
Figure (a)	6	$(0, 6)$
Figure (b)	$-3$	$(0, -3)$
Figure (c)	$-5$	$(0, 5)$
Figure (d)	0	$(0, 0)$

What is the pattern here?

In each row, the  $x$ -coordinate of the point where the line crosses the  $y$ -axis is zero. The point where the line crosses the  $y$ -axis has the form  $(0, b)$  and is called the  **$y$ -intercept** of the line. The  $y$ -intercept occurs when  $x$  is zero.

The  $x$ -intercept is the point  $(a, 0)$  where the line crosses the  $x$ -axis.

The  $y$ -intercept is the point  $(0, b)$  where the line crosses the  $y$ -axis.

	$x$	$y$
The $x$ -intercept occurs when $y$ is zero.	$a$	0
The $y$ -intercept occurs when $x$ is zero	0	$b$

**Example 3.9.19**

Find the  $x$ -intercept and  $y$ -intercept on each graph.

Figure 3.9.52

**Solution**

a. The graph crosses the  $x$ -axis at the point  $(4, 0)$ . The  $x$ -intercept is  $(4, 0)$ .

The graph crosses the  $y$ -axis at the point  $(0, 2)$ . The  $y$ -intercept is  $(0, 2)$ .

b. The graph crosses the  $x$ -axis at the point  $(2, 0)$ . The  $x$ -intercept is  $(2, 0)$ .

The graph crosses the  $y$ -axis at the point  $(0, -6)$ . The  $y$ -intercept is  $(0, -6)$ .

c. The graph crosses the  $x$ -axis at the point  $(-5, 0)$ . The  $x$ -intercept is  $(-5, 0)$ .

The graph crosses the  $y$ -axis at the point  $(0, -5)$ . The  $y$ -intercept is  $(0, -5)$ .

## Try It

43) Find the  $x$ -intercept and  $y$ -intercept on the graph.

Figure 3.9.53

### Solution

$x$ -intercept:  $(2, 0)$ ;  $y$ -intercept:  $(0, -2)$

44) Find the  $x$ -intercept and  $y$ -intercept on the graph.

Figure 3.9.54

**Solution**

$x$ -intercept:  $(3, 0)$ ,  $y$ -intercept:  $(0, 2)$

## Intercepts from an Equation of a Line

Recognizing that the  $x$ -intercept occurs when  $y$  is zero and that the  $y$ -intercept occurs when  $x$  is zero, gives us a method to find the intercepts of a line from its equation. To find the  $x$ -intercept, let  $y = 0$  and solve for  $x$ . To find the  $y$ -intercept, let  $x = 0$  and solve for  $y$ .

### Find the $x$ -intercept and $y$ -intercept from the *Equation of a Line*

Use the equation of the line. To find:

- the  $x$ -intercept of the line, let  $y = 0$  and solve for  $x$ .
- the  $y$ -intercept of the line, let  $x = 0$  and solve for  $y$ .

### Example 3.9.20

Find the intercepts of  $2x + y = 6$ .

**Solution**

We will let  $y = 0$  to find the  $x$ -intercept, and let  $x = 0$  to find the  $y$ -intercept. We will fill in the table, which reminds us of what we need to find.

$2x + y = 6$		
$x$	$y$	
	0	$x$ -intercept
0		$y$ -intercept

To find the  $x$ -intercept, let  $y = 0$ .

**Step 1: Let  $y = 0$ .**

$$\begin{aligned} 2x + y &= 6 \\ 2x + 0 &= 6 \end{aligned}$$

**Step 2: Simplify.**

$$\begin{aligned} 2x &= 6 \\ x &= 3 \end{aligned}$$

**Step 3: The  $x$ -intercept is.**

$$(3, 0)$$

**Step 4: To find the  $y$ -intercept, let  $x = 0$ .**

**Step 5: Let  $x = 0$ .**

$$\begin{aligned} 2x + y &= 6 \\ 2 \times 0 + y &= 6 \end{aligned}$$

**Step 6: Simplify.**

$$\begin{aligned} 0 + y &= 6 \\ y &= 6 \end{aligned}$$

**Step 7: The  $y$ -intercept is.**

$$(0, 6)$$

The intercepts are the points  $(3, 0)$  and  $(0, 6)$  as shown in the below table.

$2x + y = 6$	
$x$	$y$
3	0
0	6

## Try It

45) Find the intercepts of  $3x + y = 12$ .

**Solution**

$x$ -intercept:  $(4, 0)$ ,  $y$ -intercept:  $(0, 12)$

46) Find the intercepts of  $x + 4y = 8$ .

**Solution**

$x$ -intercept:  $(8, 0)$ ,  $y$ -intercept:  $(0, 2)$

## Example 3.9.21

Find the intercepts of  $4x - 3y = 12$ .

**Solution**

**Step 1:** To find the  $x$ -intercept, let  $y = 0$ .

$$4x - 3y = 12$$

$$4x - 3 \times (0) = 12$$

**Step 3: Simplify.**

$$4x - 0 = 12$$

$$4x = 12$$

$$x = 3$$

**Step 4: The  $x$ -intercept is:**

$$(3, 0)$$

**Step 5: To find the  $y$ -intercept, let  $x = 0$ .**

**Step 6: Let  $x = 0$ .**

$$4x - 3y = 12$$

$$4 \times 0 - 3y = 12$$

**Step 7: Simplify.**

$$0 - 3y = 12$$

$$-3y = 12$$

$$y = -4$$

**Step 8: The  $y$ -intercept is:**

$$(0, -4)$$

The intercepts are the points  $(3, 0)$  and  $(0, -4)$  as shown in the following table.

$4x - 3y = 12$	
$x$	$y$
3	0
0	-4

## Try It

47) Find the intercepts of  $3x - 4y = 12$ .

**Solution**

$x$ -intercept:  $(4, 0)$ ,  $y$ -intercept:  $(0, -3)$

48) Find the intercepts of  $2x - 4y = 8$ .

**Solution**

$x$ -intercept:  $(4, 0)$ ,  $y$ -intercept:  $(0, -2)$

## Graph a Line Using the Intercepts

To graph a linear equation by plotting points, you need to find three points whose coordinates are solutions to the equation. You can use the  $x$ -intercept and  $y$ -intercept as two of your three points. Find the intercepts, and then find a third point to ensure accuracy. Make sure the points line up—then draw the line. This method is often the quickest way to graph a line.

### Example 3.9.22

Graph  $-x + 2y = 6$  using the intercepts.

**Solution**

**Step 1: Find the  $x$ - and  $y$ -intercepts of the line.**

Let  $y = 0$  and solve for  $x$ .

Let  $x = 0$  and solve for  $y$ .

Find the  $x$ -intercept.

Let  $y = 0$

$$-x + 2y = 6$$

$$-x + 2(\mathbf{0}) = 6$$

$$-x = 6$$

$$x = 6$$

The x-intercept is  $(-6, 0)$ .

Find the  $y$ -intercept.

Let  $x = 0$

$$-x + 2y = 6$$

$$-\mathbf{0} + 2y = 6$$

$$2y = 6$$

$$y = 3$$

The y-intercept is  $(0, 3)$ .

**Step 2: Find another solution to the equation.**

We'll use  $x = 2$ .

Let  $x = 2$

$$-x + 2y = 6$$

$$-\mathbf{2} + 2y = 6$$

$$2y = 8$$

$$y = 4$$

A third point is  $(2, 4)$ .

**Step 3: Plot the three points.**

Check that the points line up.

$x$	$y$	$(x, y)$
-6	0	$(-6, 0)$
0	3	$(0, 3)$
2	4	$(2, 4)$

Figure 3.9.55

**Step 4: Draw the line.**

Figure 3.9.56

See the graph.

## Try It

49) Graph  $x - 2y = 4$  using the intercepts.

**Solution**

Figure 3.9.57

50) Graph  $-x + 3y = 6$  using the intercepts.

**Solution**

Figure 3.9.58

## HOW TO

### Graph a linear equation using the intercepts.

The steps to graph a linear equation using the intercepts are summarized below.

1. Find the  $x$ -intercept and  $y$ -intercept of the line.
  - Let  $y = 0$  and solve for  $x$ .
  - Let  $x = 0$  and solve for  $y$ .
2. Find a third solution to the equation.
3. Plot the three points and check that they line up.
4. Draw the line.

Example 3.9.23

Graph  $4x - 3y = 12$  using the intercepts.

Solution

x-intercept, let  $y = 0$

$$4x - 3y = 12$$

$$4x - 3(0) = 12$$

$$4x = 12$$

$$x = 3$$

y-intercept, let  $x = 0$

$$4x - 3y = 12$$

$$4(0) - 3y = 12$$

$$-3y = 12$$

$$y = -4$$

third point, let  $y = 4$

$$4x - 3y = 12$$

$$4x - 3(4) = 12$$

$$4x - 12 = 12$$

$$4x = 24$$

$$x = 6$$

Find the intercepts and a third point. We list the points in the table below and show the graph below.

$4x - 3y = 12$		
$x$	$y$	$(x, y)$
3	0	(3, 0)
0	-4	(0, -4)
6	4	(6, 4)

Figure 3.9.59

## Try It

51) Graph  $5x - 2y = 10$  using the intercepts.

**Solution**

Figure 3.9.60

52) Graph  $3x - 4y = 12$  using the intercepts.

**Solution**

Figure 3.9.61

### Example 3.9.24

Graph  $y = 5x$  using the intercepts.

#### Solution

**Step 1: Find the  $x$ - and  $y$ -intercepts of the line.**

$x$ -intercept

$$\text{Let } y = 0$$

$$y = 5x$$

$$0 = 5x$$

$$0 = x$$

$$(0, 0)$$

$y$ -intercept

$$\text{Let } x = 0$$

$$y = 5x$$

$$y = 5 \cdot 0$$

$$y = 0$$

$$(0, 0)$$

This line has only one intercept. It is the point  $(0, 0)$ .

**Step 2: To ensure accuracy we need to plot three points. Since the  $x$ -intercept and  $y$ -intercept are the same point, we need *two* more points to graph the line.**

$$\text{Let } x = 1$$

$$y = 5x$$

$$y = 5 \cdot (1)$$

$$y = 5$$

$$\text{Let } x = -1$$

$$y = 5x$$

$$y = 5(-1)$$

$$y = -5$$

See table below.

$y = 5x$		
$x$	$y$	$(x, y)$
0	0	$(0, 0)$
1	5	$(1, 5)$
-1	-5	$(-1, -5)$

**Step 3: Plot the three points, check that they line up, and draw the line.**

Figure 3.9.362

## Try It

53) Graph  $y = 4x$  using the intercepts.

**Solution**

Figure 3.9.63

54) Graph  $y = -x$  the intercepts.

**Solution**

Figure 3.9.64

## Key Concepts

### • Sign Patterns of the Quadrants

Quadrant I	Quadrant II	Quadrant III	Quadrant IV
$(x, y)$	$(x, y)$	$(x, y)$	$(x, y)$
$(+, +)$	$(-, +)$	$(-, -)$	$(+, -)$

### • Points on the Axes

- On the  $x$ -axis,  $y = 0$ . Points with a  $y$ -coordinate equal to 0 are on the  $x$ -axis, and have coordinates  $(a, 0)$ .
- On the  $y$ -axis,  $x = 0$ . Points with an  $x$ -coordinate equal to 0 are on the  $y$ -axis, and have coordinates  $(0, b)$ .

### • Solution of a Linear Equation

- An ordered pair  $(x, y)$  is a solution of the linear equation  $Ax + By = C$ , if the equation is a true statement when the  $x$  and  $y$  values of the ordered pair are substituted into the equation.

### • Graph a Linear Equation by Plotting Points

1. Find three points whose coordinates are solutions to the equation. Organize them in a table.
2. Plot the points in a rectangular coordinate system. Check that the points line up. If they do not, carefully check your work!
3. Draw the line through the three points. Extend the line to fill the grid and put arrows on both ends of the line.

### • Find the $x$ -intercept and $y$ -Intercept from the Equation of a Line

- Use the equation of the line to find the  $x$ -intercept of the line, let  $y = 0$  and solve for

$x$ .

- Use the equation of the line to find the  $y$ -intercept of the line, let  $x = 0$  and solve for  $y$ .

### • Graph a Linear Equation using the Intercepts

1. Find the  $x$ -intercept and  $y$ -intercept of the line.  
Let  $y = 0$  and solve for  $x$ .  
Let  $x = 0$  and solve for  $y$ .
2. Find a third solution to the equation.
3. Plot the three points and then check that they line up.
4. Draw the line.

### • Strategy for Choosing the Most Convenient Method to Graph a Line:

- Consider the form of the equation.
- If it only has one variable, it is a vertical or horizontal line.  
 $x = a$  is a vertical line passing through the  $x$ -axis at  $a$ .  
 $y = b$  is a horizontal line passing through the  $y$ -axis at  $b$ .
- If  $y$  is isolated on one side of the equation, graph by plotting points.
- Choose any three values for  $x$  and then solve for the corresponding  $y$ -values.
- If the equation is of the form  $Ax + By = C$ , find the intercepts. Find the  $x$ -intercept and  $y$ -intercept, then a third point.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it*

 online here:

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=1692#h5p-23>

After reviewing this checklist, what will you do to become confident for all goals?

## Glossary

### linear equation

A linear equation is of the form  $Ax + By = C$ , where  $A$  and  $B$  are not both zero, is called a linear equation in two variables.

### ordered pair

An ordered pair  $(x, y)$  gives the coordinates of a point in a rectangular coordinate system.

### origin

The point  $(0, 0)$  is called the origin. It is the point where the  $x$ -axis and  $y$ -axis intersect.

### quadrant

The  $x$ -axis and the  $y$ -axis divide a plane into four regions, called quadrants.

### rectangular coordinate system

A grid system is used in algebra to show a relationship between two variables; also called the  $xy$ -plane or the 'coordinate plane'.

### $x$ -coordinate

The first number in an ordered pair  $(x, y)$ .

### $y$ -coordinate

The second number in an ordered pair  $(x, y)$ .

### graph of a linear equation

The graph of a linear equation  $Ax + By = C$  is a straight line. Every point on the line is a solution of the equation. Every solution of this equation is a point on this line.

**horizontal line**

A horizontal line is the graph of an equation of the form  $y = b$ . The line passes through the  $y$ -axis at  $(0, b)$ .

**vertical line**

A vertical line is the graph of an equation of the form  $x = a$ . The line passes through the  $x$ -axis at  $(a, 0)$ .

**intercepts of a line**

The points where a line crosses the  $x$ -axis and the  $y$ -axis are called the intercepts of the line.

 **$x$ -intercept**

The point  $(a, 0)$  where the line crosses the  $x$ -axis; the  $x$ -intercept occurs when  $y$  is zero.

 **$y$ -intercept**

The point  $(0, b)$  where the line crosses the  $y$ -axis; the  $y$ -intercept occurs when  $x$  is zero.

## 3.10 SLOPE OF A LINE

### Learning Objectives

By the end of this section, you will be able to:

- Use  $m = \frac{\text{rise}}{\text{run}}$  to find the slope of a line from its graph
- Find the slope of horizontal and vertical lines
- Use the slope formula to find the slope of a line between two points
- Graph a line given a point and the slope
- Solve slope applications
- Recognize the relation between the graph and the slope–intercept form of an equation of a line
- Identify the slope and  $y$ -intercept form of an equation of a line
- Graph a line using its slope and intercept
- Choose the most convenient method to graph a line
- Graph and interpret applications of slope–intercept
- Use slopes to identify parallel lines
- Use slopes to identify perpendicular lines

### Try It

Before you get started, take this readiness quiz:

1) Simplify:  $\frac{1-4}{8-2}$

- 2) Divide:  $\frac{0}{4}, \frac{4}{0}$   
 3) Simplify:  $\frac{15}{-3}, \frac{-15}{3}, \frac{-15}{-3}$   
 4) Add:  $\frac{x}{4} + \frac{1}{4}$   
 5) Find the reciprocal of  $\frac{3}{7}$   
 6) Solve  $2x - 3y = 12$

When you graph linear equations, you may notice that some lines tilt up as they go from left to right and some lines tilt down. Some lines are very steep and some lines are flatter. What determines whether a line tilts up or down or if it is steep or flat?

In mathematics, the ‘tilt’ of a line is called the *slope* of the line. The concept of slope has many applications in the real world. The pitch of a roof, grade of a highway, and a ramp for a wheelchair are some examples where you literally see slopes. And when you ride a bicycle, you feel the slope as you pump uphill or coast downhill.

In this section, we will explore the concept of slope.

## Use $m = \frac{\text{rise}}{\text{run}}$ to Find the Slope of a Line from its Graph

Now, we’ll look at some graphs on the  $xy$ -coordinate plane and see how to find their slopes. The method we will use here will be similar to how one would use **geoboards**.

To find the slope, we must count out the **rise** and the **run**. But where do we start?

We locate two points on the line whose coordinates are integers. We then start with the point on the left and sketch a right triangle, so we can count the rise and run.

### Example 3.10.1

How to Use  $m = \frac{\text{rise}}{\text{run}}$  to Find the **Slope of a Line** from its Graph

Find the slope of the line shown.

Figure 3.10.1

**Solution**

Figure 3.10.2

**Step 1: Locate two points whose coordinates are integers.**

Mark  $(0, -3)$   $(5, 1)$

**Step 2: Starting with the point on the left, sketch a right triangle, going from the first point to the second point.**

Figure 3.10.3

**Step 3: Count the rise and the run on the legs of the triangle.**

Count the rise.

Count the run.

Figure 3.10.4

**Step 4: Take the ration of rise to run to find the slope.**

Use the slope formula.

$$m = \frac{\text{rise}}{\text{run}}$$

Substitute the values of the rise and run.

$$m = \frac{4}{5}$$

The slope of the line is  $\frac{4}{5}$ .

## Try It

7) Find the slope of the line shown.

Figure 3.10.5

**Solution**

$$\frac{2}{5}$$

8) Find the slope of the line shown.

Figure 3.10.6

**Solution**

$$\frac{3}{4}$$

## HOW TO

Find the slope of a line from its graph using  $m = \frac{\text{rise}}{\text{run}}$

1. Locate two points on the line whose coordinates are integers.
2. Starting with the point on the left, sketch a right triangle, going from the first point to the second point.
3. Count the rise and the run on the legs of the triangle.
4. Take the ratio of rise to run to find the slope,  $m = \frac{\text{rise}}{\text{run}}$

### Example 3.10.2

Find the slope of the line shown.

Figure 3.10.7

**Solution**

$$m = \frac{\text{rise}}{\text{run}}$$

**Step 1:** Locate two points on the graph whose coordinates are integers.

$(0, 5)$  and  $(3, 3)$

**Step 2:** Which point is on the left?

$(0, 5)$

**Step 3:** Starting at  $(0, 5)$ , sketch a right triangle to  $(3, 3)$ .

Figure 3.10.8

**Step 4:** Count the rise—it is negative.

The rise is  $-2$ .

**Step 5:** Count the run.

The run is  $3$ .

**Step 6:** Use the slope formula.

$$m = \frac{\text{rise}}{\text{run}}$$

**Step 7:** Substitute the values of the rise and run.

$$m = \frac{-2}{3}$$

Simplify.  $m = -\frac{2}{3}$

The slope of the line is  $-\frac{2}{3}$ .

Figure 3.10.9

So  $y$  increases by **3** units as  $x$  decreases by **2** units. What if we used the points left  $(-3, 7)$  and  $(6, 1)$  to find the slope of the line? The rise would be  $-6$  and the run would be  $9$ . Then  $m = \frac{-6}{9}$ , and that simplifies to  $m = -\frac{2}{3}$ . Remember, it does not matter which points you use—the slope of the line is always the same.

## Try It

9) Find the slope of the line shown.

Figure 3.10.10

**Solution**

$$-\frac{4}{3}$$

10) Find the slope of the line shown.

Figure 3.10.11

**Solution**

$$-\frac{3}{5}$$

In the last two examples, the lines had  $y$ -intercepts with integer values, so it was convenient to use the  $y$ -intercept as one of the points to find the slope. In the next example, the  $y$ -intercept is a fraction. Instead of using that point, we'll look for two other points whose coordinates are integers. This will make the slope calculations easier.

**Example 3.10.3**

Find the slope of the line shown.

Figure 3.10.12

**Solution**

**Step 1:** Locate two points on the graph whose coordinates are integers.

$$(2, 3) \text{ and } (7, 6)$$

**Step 2:** Which point is on the left?

$$(2, 3)$$

**Step 3:** Starting at  $(2, 3)$ , sketch a right triangle to  $(7, 6)$ .

Figure 3.10.13

**Step 4: Count the rise.**

The rise is **3**.

**Step 5: Count the run.**

The run is **5**.

**Step 6: Use the slope formula.**

$$m = \frac{\text{rise}}{\text{run}}$$

**Step 7: Substitute the values of the rise and run.**

The slope of the line is  $\frac{3}{5}$

This means that  $y$  increases **5** units as  $x$  increases **3** units. If you used a geoboard to introduce the concept of slope, you would always start with the point on the left and count the rise and the run to get to the point on the right. That way the run was always positive and the rise determined whether the slope was positive or negative. What would happen if we started with the point on the right? Let's use the points **(2, 3)** and **(7, 6)** again, but now we'll start at **(7, 6)**.

Figure 3.10.14

**Step 1: Count the rise.**

The rise is **—3**.

**Step 2: Count the run. It goes from right to left, so it is negative.**

The run is **—5**.

**Step 3: Use the slope formula.**

$$m = \frac{\text{rise}}{\text{run}}$$

**Step 4: Substitute the values of the rise and run.**

$$m = \frac{-3}{-5}$$

**Step 5: The slope of the line is  $\frac{3}{5}$ .**

It does not matter where you start—the slope of the line is always the same.

## Try It

11) Find the slope of the line shown.

Figure 3.10.15

**Solution**

$$\frac{5}{4}$$

12) Find the slope of the line shown.

Figure 3.10.16

**Solution**

$$\frac{3}{2}$$

## Find the Slope of Horizontal and Vertical Lines

Do you remember what was special about horizontal and vertical lines? Their equations had just one variable.

---

Horizontal line  $y = b$

Vertical line  $x = a$

$y$ -coordinates are the same.

$x$ -coordinates are the same.

---

So how do we find the slope of the horizontal line  $y = 4$ ? One approach would be to graph the horizontal line, find two points on it, and count the rise and the run. Let's see what happens when we do this.

Figure 3.10.17

**Step 1: What is the rise?**

The rise is 0.

**Step 2: Count the run.**

The run is 3.

**Step 3: What is the slope?**

$$m = \frac{\text{rise}}{\text{run}}$$

$$m = \frac{0}{3}$$

$$m = 0$$

The slope of the horizontal line  $y = 4$  is 0.

All horizontal lines have slope 0. When the  $y$ -coordinates are the same, the rise is 0.

## Slope of a Horizontal Line

The slope of a horizontal line,  $y = b$ , is 0.

The floor of your room is horizontal. Its slope is 0. If you carefully placed a ball on the floor, it would not roll away.

Now, we'll consider a vertical line, the line.

Figure 3.10.18

### Step 1: What is the rise?

The rise is 2.

### Step 2: Count the run.

The run is 0.

### Step 3: What is the slope?

$$m = \frac{\text{rise}}{\text{run}}$$

$$m = \frac{2}{0}$$

But we can't divide by 0. Division by 0 is not defined. So we say that the slope of the vertical line  $x = 3$  is undefined.

The slope of any vertical line is undefined. When the  $x$ -coordinates of a line are all the same, the run is 0.

## Slope of a Vertical Line

The slope of a vertical line,  $x = a$ , is undefined.

### Example 3.10.4

Find the slope of each line:

- a.  $x = 8$
- b.  $y = -5$

**Solution**

- a.  $x = 8$

This is a vertical line.

Its slope is undefined.

- 
- b.  $y = -5$

This is a horizontal line.

It has slope 0.

## Try It

13) Find the slope of the line:  $x = -4$ .

**Solution**

undefined

14) Find the slope of the line:  $y = 7$ .

**Solution**

0

## Quick Guide to the Slopes of Lines

Figure 3.10.19

Remember, we ‘read’ a line from left to right, just like we read written words in English.

## Use the Slope Formula to find the Slope of a Line Between Two Points

Sometimes we’ll need to find the slope of a line between two points when we don’t have a graph to count out the rise and the run. We could plot the points on grid paper, then count out the rise and the run, but as we’ll

see, there is a way to find the slope without graphing. Before we get to it, we need to introduce some algebraic notation.

We have seen that an ordered pair  $(x, y)$  gives the coordinates of a point. But when we work with slopes, we use two points. How can the same symbol  $(x, y)$  be used to represent two different points? Mathematicians use subscripts to distinguish the points.

---

$(x_1, y_1)$	read ‘ $x$ sub 1, $y$ sub 1’
$(x_2, y_2)$	read ‘ $x$ sub 2, $y$ sub 2’

---

The use of subscripts in math is very much like the use of last name initials in elementary school. Maybe you remember Laura C. and Laura M. in your third grade class?

We will use  $(x_1, y_1)$  to identify the first point and  $(x_2, y_2)$  to identify the second point.

If we had more than two points, we could use  $(x_3, y_3)$ ,  $(x_4, y_4)$ , and so on.

Let’s see how the rise and run relate to the coordinates of the two points by taking another look at the slope of the line between the points  $(2, 3)$  and  $(7, 6)$ .

Figure 3.10.20

Since we have two points, we will use subscript notation,

$$\begin{pmatrix} x_1 & y_1 \\ 2 & 3 \end{pmatrix} \quad \begin{pmatrix} x_2 & y_2 \\ 7 & 6 \end{pmatrix}$$

On the graph, we counted the rise of 3 and the run of 5.

Notice that the rise of 3 can be found by subtracting the  $y$ -coordinates 6 and 3.

$$3 = 6 - 3$$

And the run of 5 can be found by subtracting the  $x$ -coordinates 7 and 2.

$$5 = 7 - 2$$

We know  $m = \frac{\text{rise}}{\text{run}}$ . So  $m = \frac{3}{5}$ .

We rewrite the rise and run by putting in the coordinates  $m = \frac{6 - 3}{7 - 2}$ .

But 6 is  $y_2$ , the  $y$ -coordinate of the second point and 3 is  $y_1$  the  $y$ -coordinate of the first point.

So we can rewrite the slope using subscript notation.  $m = \frac{y_2 - y_1}{7 - 2}$

Also, 7 is  $x_2$ , the  $x$ -coordinate of the second point and 2 is  $x_1$ , the  $x$ -coordinate of the first point.

So, again, we rewrite the slope using subscript notation.  $m = \frac{y_2 - y_1}{x_2 - x_1}$

We've shown that  $m = \frac{y_2 - y_1}{x_2 - x_1}$  is really another version of  $m = \frac{\text{rise}}{\text{run}}$ . We can use this formula to find the slope of a line when we have two points on the line.

## Slope Formula

The slope of the line between two points  $(x_1, y_1)$  and  $(x_2, y_2)$  is

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

This is the **slope formula**.

The slope is:

$y$  of the second point minus  $y$  of the first point  
over  
 $x$  of the second points minus  $x$  of the first point

### Example 3.10.5

Use the slope formula to find the slope of the line between the points  $(1, 2)$  and  $(4, 5)$ .

**Solution**

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

**Step 1:** We'll call  $(1, 2)$  point #1 and  $(4, 5)$  point #2.

$$\begin{pmatrix} x_1 & y_1 \\ 1 & 2 \end{pmatrix} \quad \begin{pmatrix} x_2 & y_2 \\ 4 & 5 \end{pmatrix}$$

**Step 2:** Use the slope formula.

$$m = \frac{\text{rise}}{\text{run}}$$

**Step 3:** Substitute the values.

$y$  of the second point minus  $y$  of the first point.

$$m = \frac{5 - 2}{x_2 - x_1}$$

$x$  of the second point minus  $x$  of the first point.

$$m = \frac{5 - 2}{4 - 1}$$

**Step 4:** Simplify the numerator and the denominator.

$$m = \frac{3}{3}$$

Simplify.  $m = 1$

Let's confirm this by counting out the slope on a graph using  $m = \frac{\text{rise}}{\text{run}}$ .

Figure 3.10.21

It doesn't matter which point you call point #1 and which one you call point #2. The slope will be the same. Try the calculation yourself.

## Try It

15) Use the slope formula to find the slope of the line through the points:  $(8, 5)$  and  $(6, 3)$ .

**Solution**

1

16) Use the slope formula to find the slope of the line through the points:  $(1, 5)$  and  $(5, 9)$ .

**Solution**

1

### Example 3.10.6

Use the slope formula to find the slope of the line through the points  $(-2, -3)$  and  $(-7, 4)$ .

**Solution**

**Step 1.** We'll call  $(-2, -3)$  **point #1** and  $(-7, 4)$  **point #2**.

$$\begin{pmatrix} x_1 & y_1 \\ -2 & -3 \end{pmatrix} \quad \begin{pmatrix} x_2 & y_2 \\ -7 & 4 \end{pmatrix}$$

**Step 2.** Use the slope formula.

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

**Step 3.** Substitute the values.

$y$  of the second point minus  $y$  of the first point.

$$m = \frac{4 - (-3)}{x_2 - x_1}$$

$x$  of the second point minus  $x$  of the first point.

$$m = \frac{4 - (-3)}{-7 - (-2)}$$

**Step 4.** Simplify.

$$m = \frac{7}{-5}$$

$$m = -\frac{7}{5}$$

Let's verify this slope on the graph shown.

Figure 3.10.22

$$m = \frac{\text{rise}}{\text{run}}$$

$$m = \frac{-7}{5}$$

$$m = -\frac{7}{5}$$

## Try It

17) Use the slope formula to find the slope of the line through the points:  $(-3, 4)$  and  $(2, -1)$

**Solution**

$-1$

18) Use the slope formula to find the slope of the line through the pair of points:  $(-2, 6)$  and  $(-3, -4)$ .

**Solution**

10

## Graph a Line Given a Point and the Slope

Up to now, in this chapter, we have graphed lines by plotting points, by using intercepts, and by recognizing horizontal and vertical lines.

One other method we can use to graph lines is called the *point-slope method*. We will use this method when we know one point and the slope of the line. We will start by plotting the point and then use the definition of slope to draw the graph of the line.

### Example 3.10.7

Graph the line passing through the point  $(1, -1)$  whose slope is  $m = \frac{3}{4}$ .

**Solution**

**Step 1: Plot the given point.**

Plot  $(1, -1)$ .

Figure 3.10.23

**Step 2: Use the slope formula  $m = \frac{\text{rise}}{\text{run}}$  to identify the rise and the run.**

Identify the rise and the run.

$$m = \frac{3}{4}$$

$$\frac{\text{rise}}{\text{run}} = \frac{3}{4}$$

$$\text{rise} = 3$$

$$\text{run} = 4$$

**Step 3: Starting at the given point, count out the rise and run to mark the second point**

Start at  $(1, -1)$  and count the rise and the run. Up **3** units, right **4** units.

Figure 3.10.24

**Step 4: Connect the points with a line.**

Connect the two points with a line.

Figure 3.10.25

**Try It**

19) Graph the line passing through the point  $(2, -2)$  with the slope  $m = \frac{4}{3}$ .

**Solution**

Figure 3.10.26

20) Graph the line passing through the point  $(-2, 3)$  with the slope  $m = \frac{1}{4}$ .

**Solution**

Figure 3.10.27

## HOW TO

### Graph a line given a point and the slope.

1. Plot the given point.
2. Use the slope formula  $m = \frac{\text{rise}}{\text{run}}$  to identify the rise and the run.
3. Starting at the given point, count out the rise and run to mark the second point.
4. Connect the points with a line.

### Example 3.10.8

Graph the line with  $y$ -intercept  $2$  whose slope is  $m = -\frac{2}{3}$ .

#### Solution

**Step 1:** Plot the given point, the  $y$ -intercept,  $(0, 2)$ .

Figure 3.10.28

$$m = -\frac{2}{3}$$

**Step 2: Identify the rise and the run.**

$$\left(\frac{\text{rise}}{\text{run}}\right) = \frac{-2}{3}$$

$$\text{rise} = -2$$

$$\text{run} = 3$$

Figure 3.10.29

**Step 3: Count the rise and the run. Mark the second point.**

**Step 4: Connect the two points with a line.**

Figure 3.10.30

You can check your work by finding a third point. Since the slope is  $m = -\frac{2}{3}$ , it can be written as

$m = \frac{2}{-3}$ . Go back to  $(0, 2)$  and count out the rise,  $2$ , and the run,  $-3$

## Try It

21) Graph the line with the  $y$ -intercept  $4$  and slope  $m = -\frac{5}{2}$ .

**Solution**

Figure 3.10.31

22) Graph the line with the  $x$ -intercept  $-3$  and slope  $m = -\frac{3}{4}$ .

**Solution**

Figure 3.10.32

### Example 3.10.9

Graph the line passing through the point  $(-1, -3)$  whose slope is  $m = 4$ .

#### Solution

**Step 1: Plot the given point.**

Figure 3.10.33

**Step 2: Identify the rise and the run.**

$$m = 4$$

**Step 3: Write 4 as a fraction.**

$$\frac{\text{rise}}{\text{run}} = \frac{4}{1}$$

$$\text{rise} = 4$$

$$\text{run} = 1$$

**Step 4: Count the rise and run and mark the second point.**

Figure 3.10.34

**Step 5:** Connect the two points with a line.

Figure 3.10.35

You can check your work by finding a third point. Since the slope is  $m = 4$ , it can be written as  $m = \frac{-4}{-1}$ . Go back to  $(-1, -3)$  and count out the rise,  $-4$ , and the run,  $-1$ .

## Try It

23) Graph the line with the point  $(-2, 1)$  and slope  $m = 3$ .

### Solution

Figure 3.10.36

24) Graph the line with the point  $(4, -2)$  and slope  $m = -2$ .

### Solution

Figure 3.10.37

## Solve Slope Applications

At the beginning of this section, we said there are many applications of slope in the real world. Let's look at a few now.

### Example 3.10.10

The 'pitch' of a building's roof is the slope of the roof. Knowing the pitch is important in climates where there is heavy snowfall. If the roof is too flat, the weight of the snow may cause it to collapse. What is the slope of the roof shown?

Figure 3.10.38

#### Solution

**Step 1:** Use the slope formula.

$$m = \frac{\text{rise}}{\text{run}}$$

**Step 2:** Substitute the values for rise and run.

$$m = \frac{9}{18}$$

**Step 3:** Simplify.

$$m = \frac{1}{2}$$

**Step 4:** The slope of the roof is  $\frac{1}{2}$ .

The roof rises **1** foot for every **2** feet of horizontal run.

## Try It

25) Use Example 3.10.10, substituting the *rise* = 14 and *run* = 24.

**Solution**

$$\frac{7}{12}$$

26) Use Example 3.10.10, substituting *rise* = 15 and *run* = 36.

**Solution**

$$\frac{5}{12}$$

## Example 3.10.11

Have you ever thought about the sewage pipes going from your house to the street? They must slope down  $\frac{1}{4}$  inch per foot in order to drain properly. What is the required slope?

Figure 3.10.39

**Solution****Step 1:** Use the slope formula

$$m = \frac{\text{rise}}{\text{run}}$$

$$m = \frac{-\frac{1}{4} \text{ inch}}{1 \text{ foot}}$$

$$m = \frac{-\frac{1}{4} \text{ inch}}{12 \text{ inches}}$$

Simplify.  $m = -\frac{1}{48}$

The slope of the pipe is  $-\frac{1}{48}$

The pipe drops **1** inch for every **48** inches of horizontal run.

**Try It**

27) Find the slope of a pipe that slopes down  $\frac{1}{3}$  inch per foot.

**Solution**

$$-\frac{1}{36}$$

28) Find the slope of a pipe that slopes down  $\frac{3}{4}$  inch per yard.

**Solution**

$$-\frac{1}{48}$$

## Recognize the Relation Between the Graph and the Slope–Intercept Form of an Equation of a Line

We have graphed linear equations by plotting points, using intercepts, recognizing horizontal and vertical lines, and using the point–slope method. Once we see how an equation in slope–intercept form and its graph are related, we’ll have one more method we can use to graph lines.

In Graph Linear Equations in Two Variables, we graphed the line of the equation  $y = \frac{1}{2}x + 3$  by plotting points. See Figure 3.10.40. Let’s find the slope of this line.

Figure 3.10.40

The red lines show us the rise is **1** and the run is **2**. Substituting into the slope formula:

$$m = \frac{\text{rise}}{\text{run}}$$

$$m = \frac{1}{2}$$

What is the  $y$ -intercept of the line? The  $y$ -intercept is where the line crosses the  $y$ -axis, so  $y$ -intercept is  $(0, 3)$ . The equation of this line is:

$$y = \frac{1}{2}x + 3$$

Notice, the line has:

$$\text{Slope } m = \frac{1}{2}$$

When a linear equation is solved for  $y$ , the coefficient of the  $x$  term is the slope and the constant term is the  $y$ -coordinate of the  $y$ -intercept. We say that the equation  $y = \frac{1}{2}x + 3$  is in slope–intercept form.

$$\text{Slope } m = \frac{1}{2}$$

$$y = \frac{1}{2}x + 3$$

$$y = mx + b$$

## Slope-Intercept Form of an Equation of a Line

The slope–intercept form of an equation of a line with slope  $m$  and  $y$ -intercept,  $(0, b)$  is,

$$y = mx + b$$

Sometimes the slope–intercept form is called the “ $y$ -form.”

### Example 3.10.12

Use the graph to find the slope and  $y$ -intercept of the line,  $y = 2x + 1$ .

Compare these values to the equation  $y = mx + b$ .

**Solution**

Figure 3.10.41

To find the slope of the line, we need to choose two points on the line. We'll use the points  $(0, -1)$  and  $(1, 1)$ .

**Step 1: Find the rise and run.**

$$\begin{aligned} m &= \frac{\text{rise}}{\text{run}} \\ m &= \frac{2}{1} \\ m &= 2 \end{aligned}$$

**Step 2: Find the  $y$ -intercept of the line.**

The  $y$ -intercept is the point  $(0, -1)$ .

**Step 3: We found the slope  $m = 2$  and the  $y$ -intercept  $(0, -1)$ .**

$$\begin{aligned} y &= 2x + (-1) \\ y &= 2x - 1 \end{aligned}$$

The slope is the same as the coefficient of  $x$  and the  $y$ -coordinate of the  $y$ -intercept is the same as the constant term.

## Try It

29) Use the graph to find the slope and  $y$ -intercept of the line  $y = \frac{2}{3}x - 1$ . Compare these values to the equation  $y = mx + b$ .

Figure 3.10.42

### Solution

slope  $m = \frac{2}{3}$  and  $y$ -intercept  $(0, -1)$

30) Use the graph to find the slope and  $y$ -intercept of the line  $y = \frac{1}{2}x + 3$ . Compare these values to the equation  $y = mx + b$ .

Figure 3.10.43

**Solution**

slope  $m = \frac{1}{2}$  and  $y$ -intercept  $(0, 3)$

## Identify the Slope and $y$ -Intercept From an Equation of a Line

In Understand Slope of a Line, we graphed a line using the slope and a point. When we are given an equation in slope–intercept form, we can use the  $y$ -intercept as the point, and then count out the slope from there. Let's practice finding the values of the slope and  $y$ -intercept from the equation of a line.

### Example 3.10.13

Identify the slope and  $y$ -intercept of the line with equation  $y = -3x + 5$ .

**Solution**

We compare our equation to the slope–intercept form of the equation.

$$y = mx + b$$

**Step 1: Write the equation of the line.**

$$y = -3x + 5$$

**Step 2: Identify the slope.**

$$m = -3$$

**Step 3: Identify the  $y$ -intercept.**

$y$ -intercept is  $(0, 5)$ .

**Try It**

31) Identify the slope and  $y$ -intercept of the line  $y = \frac{2}{5}x - 1$

**Solution**

$$\frac{2}{5}; (0, -1)$$

32) Identify the slope and  $y$ -intercept of the line  $y = -\frac{4}{3}x + 1$

**Solution**

$$-\frac{4}{3}; (0, 1)$$

When an equation of a line is not given in slope–intercept form, our first step will be to solve the equation for  $y$ .

**Example 3.10.14**

Identify the slope and  $y$ -intercept of the line with equation  $x + 2y = 6$ .

**Solution**

This equation is not in slope-intercept form. In order to compare it to the slope-intercept form we must first solve the equation for  $y$ .

**Step 1: Solve for  $y$ .**

$$x + 2y = 6$$

**Step 2: Subtract  $x$  from each side.**

$$2y = -x + 6$$

**Step 3: Divide both sides by 2.**

$$\frac{2y}{2} = \frac{-x + 6}{2}$$

Simplify. 
$$\frac{2y}{2} = \frac{-x}{2} + \frac{6}{2}$$

Remember: 
$$\frac{a + b}{c} = \frac{a}{c} + \frac{b}{c}$$

$$y = -\frac{1}{2}x + 3$$

**Step 6: Write the slope-intercept form of the equation of the line.**

$$y = mx + b$$

**Step 7: Write the equation of the line.**

$$y = -\frac{1}{2}x + 3$$

**Step 8: Identify the slope.**

$$m = -\frac{1}{2}$$

**Step 9: Identify the  $y$ -intercept.**

$$y\text{-intercept} = (0, 3)$$

## Try It

33) Identify the slope and  $y$ -intercept of the line  $x + 4y = 8$ .

**Solution**

$$-\frac{1}{4}; (0, 2)$$

34) Identify the slope and  $y$ -intercept of the line  $3x + 2y = 12$ .

**Solution**

$$-\frac{3}{2}; (0, 6)$$

## Graph a Line Using its Slope and Intercept

Now that we know how to find the slope and  $y$ -intercept of a line from its equation, we can graph the line by plotting the  $y$ -intercept and then using the slope to find another point.

### Example 3.10.15

Graph the line of the equation  $y = 4x - 2$  using its slope and  $y$ -intercept.

**Solution**

**Step 1: Find the slope-intercept form of the equation.**

This equation is in slope-intercept form

$$y = 4x - 2$$

**Step 2: Identify the slope and  $y$ -intercept.**

Use  $y = mx + b$

Find the slope.

Find the  $y$ -intercept.

$$y = mx + b$$

$$y = 4x + (-2)$$

$$m = 4$$

$$b = -2, (0, -2)$$

Figure 3.10.44

**Step 4:** Use the slope formula  $m = \frac{\text{rise}}{\text{run}}$  to identify the rise and the run.

Identify the rise and the run.

$$m = 4$$

$$\frac{\text{rise}}{\text{run}} = \frac{4}{1}$$

$$\text{rise} = 4$$

$$\text{run} = 1$$

**Step 5:** Starting at the  $y$ -intercept, count out the rise and run to mark the second point.

Start at  $(0, -2)$  and count the rise and run.

Up 4, right 1.

Figure 3.10.45

**Step 6: Connect the points with a line.**

Connect the two points with a line.

Figure 3.10.46

## Try It

35) Graph the line of the equation  $y = 4x + 1$  using its slope and  $y$ -intercept.

### Solution

Figure 3.10.47

36) Graph the line of the equation  $y = 2x - 3$  using its slope and  $y$ -intercept.

### Solution

Figure 3.10.48

## HOW TO

### Graph a line using its slope and $y$ -intercept.

1. Find the slope-intercept form of the equation of the line.
2. Identify the slope and  $y$ -intercept.
3. Plot the  $y$ -intercept.
4. Use the slope formula  $m = \frac{\text{rise}}{\text{run}}$  to identify the **rise** and the **run**.
5. Starting at the  $y$ -intercept, count out the rise and run to mark the second point.
6. Connect the points with a line.

### Example 3.10.16

Graph the line of the equation  $y = -x + 4$  using its slope and  $y$ -intercept.

**Solution**

$$y = mx + b$$

**Step 1:** The equation is in slope-intercept form.

$$y = -x + 4$$

**Step 2:** Identify the slope and  $y$ -intercept.

$$m = -1$$

$$y\text{-intercept is } (0, 4)$$

**Step 3:** Plot the  $y$ -intercept.

See graph below.

**Step 4:** Identify the rise and the run.

$$m = \frac{-1}{1}$$

**Step 5:** Count out the rise and run to mark the second point.

Figure 3.10.49

**Step 6: Draw the line.**

**Step 7: To check your work, you can find another point on the line and make sure it is a solution of the equation.**

In the graph we see the line goes through  $(4, 0)$ .

**Step 8: Check.**

$$y = -x + 4$$

$$0 \stackrel{?}{=} -4 + 4$$

$$0 = 0 \checkmark$$

## Try It

37) Graph the line of the equation  $y = -x - 3$  using its slope and  $y$ -intercept.

**Solution**

Figure 3.10.50

38) Graph the line of the equation  $y = -x - 1$  using its slope and  $y$ -intercept.

**Solution**

Figure 3.10.51

**Example 3.10.17**

Graph the line of the equation  $y = -\frac{2}{3}x - 3$  using its slope and  $y$ -intercept.

**Solution**

$$y = mx + b$$

**Step 1:** The equation is in slope-intercept form.

$$m = -\frac{2}{3}; y\text{-intercept is } (0, -3)$$

**Step 2:** Identify the slope and  $y$ -intercept.

See graph below.

**Step 3:** Plot the  $y$ -intercept.

**Step 4:** Identify the rise and the run.

**Step 5:** Count out the rise and run to mark the second point.

**Step 6:** Draw the line.

Figure 3.10.52

## Try It

39) Graph the line of the equation  $y = -\frac{5}{2}x + 1$  using its slope and  $y$ -intercept.

### Solution

Figure 3.10.53

40) Graph the line of the equation  $y = -\frac{3}{4}x - 2$  using its slope and  $y$ -intercept.

### Solution

Figure 3.10.54

### Example 3.10.18

Graph the line of the equation  $4x - 3y = 12$  using its slope and  $y$ -intercept.

**Solution**

$$4x - 3y = 12$$

**Step 1:** Find the slope-intercept form of the equation.

$$\begin{aligned} 4x - 3y &= 12 \\ -3y &= -4x + 12 \\ -\frac{3y}{3} &= \frac{-4x + 12}{-3} \end{aligned}$$

**Step 2:** The equation is now in slope-intercept form.

$$y = \frac{4}{3}x - 4$$

**Step 3:** Identify the slope and  $y$ -intercept.

$$m = \frac{4}{3}$$

$y$ -intercept is  $(0, -4)$

See graph below.

**Step 4:** Plot the  $y$ -intercept.

**Step 5:** Identify the rise and the run; count out the rise and run to mark the second point.

**Step 6:** Draw the line.

Figure 3.10.55

## Try It

41) Graph the line of the equation  $2x - y = 6$  using its slope and  $y$ -intercept.

**Solution**

Figure 3.10.56

42) Graph the line of the equation  $3x - 2y = 8$  using its slope and  $y$ -intercept.

**Solution**

Figure 3.10.57

We have used a grid with  $x$  and  $y$  both going from about  $-10$  to  $10$  for all the equations we've graphed so far. Not all linear equations can be graphed on this small grid. Often, especially in applications with real-world data, we'll need to extend the axes to bigger positive or smaller negative numbers.

### Example 3.10.19

Graph the line of the equation  $y = 0.2x + 45$  using its slope and  $y$ -intercept.

**Solution**

We'll use a grid with the axes going from about  $-80$  to  $80$ .

$$y = mx + b$$

**Step 1: The equation is in slope-intercept form.**

$$y = 0.2x + 45$$

**Step 2: Identify the slope and  $y$ -intercept.**

$$m = 0.2$$

The  $y$ -intercept is  $(0, 45)$ .

**Step 3: Plot the  $y$ -intercept.**

See graph below.

**Step 4: Count out the rise and run to mark the second point.**

The slope is  $m = 0.2$ ; in fraction form this means  $m = \frac{2}{10}$ . Given the scale of our graph, it would be easier to use the equivalent fraction  $m = \frac{10}{50}$ .

**Step 5: Draw the line.**

Figure 3.10.58

## Try It

43) Graph the line of the equation  $y = 0.5x + 25$  using its slope and  $y$ -intercept.

**Solution**

Figure 3.10.59

44) Graph the line of the equation  $y = 0.1x - 30$  using its slope and  $y$ -intercept.

**Solution**

Figure 3.10.60

Now that we have graphed lines by using the slope and  $y$ -intercept, let's summarize all the methods we have used to graph lines. See Figure 3.10.61.

## Choose the Most Convenient Method to Graph a Line

Now that we have seen several methods we can use to graph lines, how do we know which method to use for a given equation?

While we could plot points, use the slope–intercept form, or find the intercepts for *any* equation, if we recognize the most convenient way to graph a certain type of equation, our work will be easier. Generally, plotting points is not the most efficient way to graph a line. We saw better methods in previous sections and earlier in this section. Let’s look for some patterns to help determine the most convenient method to graph a line.

Here are six equations we graphed in this chapter, and the method we used to graph each of them.

	Equation	Method
#1	$x = 2$	Vertical Line
#2	$y = 4$	Horizontal Line
#3	$-x + 2y = 6$	Intercepts
#4	$4x - 3y = 12$	Intercepts
#5	$y = 4x - 2$	Slope-intercept
#6	$y = -x + 4$	Slope-intercept

Equations #1 and #2 each have just one variable. Remember, in equations of this form the value of that one variable is constant; it does not depend on the value of the other variable. Equations of this form have graphs that are vertical or horizontal lines.

In equations #3 and #4, both  $x$  and  $y$  are on the same side of the equation. These two equations are of the form  $Ax + By = C$ . We substituted  $y = 0$  to find the  $x$ -intercept and  $x = 0$  to find the  $y$ -intercept, and then found a third point by choosing another value for  $x$  or  $y$ .

Equations #5 and #6 are written in slope–intercept form. After identifying the slope and  $y$ -intercept from the equation we used them to graph the line.

This leads to the following strategy.

## Strategy for Choosing the Most Convenient Method to Graph a Line

Consider the form of the equation.

- **If it only has one variable, it is a vertical or horizontal line.**
  - $x = a$  is a vertical line passing through the  $x$ -axis at  $a$ .
  - $y = b$  is a horizontal line passing through the  $y$ -axis at  $b$ .
- **If  $y$  is isolated on one side of the equation, in the form  $y = mx + b$ , graph by using the slope and  $y$ -intercept.**
  - Identify the slope and  $y$ -intercept and then graph.

- If the equation is of the form  $Ax + By = C$ , find the intercepts.
  - Find the  $x$ - and  $y$ -intercepts, a third point, and then graph.

### Example 3.10.20

Determine the most convenient method to graph each line.

- $y = -6$
- $5x - 3y = 15$
- $x = 7$
- $y = \frac{2}{5}x - 1$

#### Solution

- $y = -6$

This equation has only one variable,  $y$ . Its graph is a horizontal line crossing the  $y$ -axis at  $-6$ .

---

- $5x - 3y = 15$

This equation is of the form  $Ax + By = C$ . The easiest way to graph it will be to find the intercepts and one more point.

---

- $x = 7$

There is only one variable,  $x$ . The graph is a vertical line crossing the  $x$ -axis at  $7$ .

---

- $y = \frac{2}{5}x - 1$

Since this equation is in  $y = mx + b$  form, it will be easiest to graph this line by using the slope and  $y$ -intercept.

## Try It

45) Determine the most convenient method to graph each line:

a.  $3x + 2y = 12$

b.  $y = 4$

c.  $y = \frac{1}{5}x - 4$

d.  $x = -7$

### Solution

- a. intercepts
- b. horizontal line
- c. slope-intercept
- d. vertical line

46) Determine the most convenient method to graph each line:

a.  $x = 6$

b.  $y = -\frac{3}{4}x + 1$

c.  $y = -8$

d.  $4x - 3y = -1$

### Solution

- a. vertical line
- b. slope-intercept
- c. horizontal line
- d. intercepts

## Graph and Interpret Applications of Slope–Intercept

Many real-world applications are modelled by linear equations. We will take a look at a few applications here so you can see how equations written in slope–intercept form relate to real-world situations.

Usually when a linear equation models a real-world situation, different letters are used for the variables, instead of  $x$  and  $y$ . The variable names remind us of what quantities are being measured.

### Example 3.10.21

The equation  $F = \frac{9}{5}C + 32$  is used to convert temperatures,  $C$ , on the Celsius scale to temperatures,  $F$ , on the Fahrenheit scale.

- Find the Fahrenheit temperature for a Celsius temperature of 0.
- Find the Fahrenheit temperature for a Celsius temperature of 20.
- Interpret the slope and  $F$ -intercept of the equation.
- Graph the equation.

#### Solution

a.

**Step 1:** Find the Fahrenheit temperature for a Celsius temperature of 0.

**Step 2:** Find  $F$  when  $C = 0$ .

$$\begin{aligned} F &= \frac{9}{5}C + 32 \\ F &= \frac{9}{5} \times 0 + 32 \\ F &= 32 \end{aligned}$$

b.

**Step 1:** Find the Fahrenheit temperature for a Celsius temperature of 20.

**Step 2:** Find  $F$  when  $C = 20$ .

$$F = \frac{9}{5}C + 32$$

$$F = \frac{9}{5}(20) + 32$$

$$F = 36 + 32$$

$$F = 68$$

---

c.

Interpret the slope and  $F$ -intercept of the equation. Even though this equation uses  $F$  and  $C$ , it is still in slope-intercept form.

$$y = mx + b$$

$$F = mC + b$$

$$F = \frac{9}{5}C + 32$$

The slope,  $\frac{9}{5}$ , means that the temperature Fahrenheit ( $F$ ) increases **9** degrees when the temperature Celsius ( $C$ ) increases **5** degrees. The  $F$ -intercept means that when the temperature is **(0)** on the Celsius scale, it is **32°** on the Fahrenheit scale.

---

d.

Graph the equation. We'll need to use a larger scale than our usual. Start at the  $F$ -intercept **(0, 32)** then count out the rise of **9** and the run of **5** to get a second point. See Figure 3.10.62

Figure 3.10.62

## Try It

47) The equation  $h = 2s + 50$  is used to estimate a woman's height in inches,  $h$ , based on her shoe size,  $s$ .

- Estimate the height of a child who wears women's shoe size 0.
- Estimate the height of a woman with shoe size 8.
- Interpret the slope and  $h$ -intercept of the equation.
- Graph the equation.

### Solution

- 50 inches

- b. **66** inches
- c. The slope, **2**, means that the height,  $h$ , increases by **2** inches when the shoe size,  $s$ , increases by **1**. The  $h$ -intercept means that when the shoe size is **0**, the height is **50** inches.
- d.

Figure 3.10.63

48) The equation  $T = \frac{1}{4}n + 40$  is used to estimate the temperature in degrees Fahrenheit,  $T$ , based on the number of cricket chirps,  $n$ , in one minute.

- Estimate the temperature when there are no chirps.
- Estimate the temperature when the number of chirps in one minute is **100**.
- Interpret the slope and  $T$ -intercept of the equation.
- Graph the equation.

### Solution

- 40** degrees
- 65** degrees
- The slope,  $\frac{1}{4}$ , means that the temperature Fahrenheit ( $F$ ) increases **1** degree when the number of chirps,  $n$ , increases by **4**. The  $T$ -intercept means that when the number of chirps is **0**, the temperature is **40°**
-

Figure 3.10.64

The cost of running some types business has two components—a *fixed cost* and a *variable cost*. The fixed cost is always the same regardless of how many units are produced. This is the cost of rent, insurance, equipment, advertising, and other items that must be paid regularly. The variable cost depends on the number of units produced. It is for the material and labour needed to produce each item.

### Example 3.10.22

Stella has a home business selling gourmet pizzas. The equation  $C = 4p + 25$  models the relation between her weekly cost,  $C$ , in dollars and the number of pizzas,  $p$ , that she sells.

- Find Stella's cost for a week when she sells no pizzas.
- Find the cost for a week when she sells **15** pizzas.
- Interpret the slope and  $C$ -intercept of the equation.
- Graph the equation.

#### Solution

a.

**Step 1: Find Stella's cost for a week when she sells no pizzas.**

$$C = 4p + 25$$

**Step 2:** Find  $C$  when  $p = 0$ .

$$C = 4p + 25$$

$$C = 4(0) + 25$$

Simplify.  $C = 25$

Stella's fixed cost is \$25 when she sells no pizzas.

---

b.

**Step 1:** Find the cost for a week when she sells 15 pizzas.

$$C = 4p + 25$$

**Step 2:** Find  $C$  when  $p = 15$ .

$$C = 4p + 25$$

$$C = 4(15) + 25$$

Simplify.  $C = 60 + 25$

$$C = 85$$

Stella's costs are \$85 when she sells 15 pizzas.

---

c.

**Step 1:** Interpret the slope and  $C$ -intercept of the equation.

$$y = mx + b$$

$$C = 4p + 25$$

The slope, 4, means that the cost increases by \$4 for each pizza Stella sells. The  $C$ -intercept means that even when Stella sells no pizzas, her costs for the week are \$25.

---

d.

**Step 1:** Graph the equation.

We'll need to use a larger scale than our usual. Start at the  $C$ -intercept  $(0, 25)$  then count out the rise of 4 and the run of 1 to get a second point

Figure 3.10.65

## Try It

49) Sam drives a delivery van. The equation  $C = 0.5m + 60$  models the relation between his weekly cost,  $C$ , in dollars and the number of miles,  $m$ , that he drives.

- Find Sam's cost for a week when he drives **0** miles.
- Find the cost for a week when he drives **250** miles.
- Interpret the slope and  $C$ -intercept of the equation.
- Graph the equation.

### Solution

- \$60**
- \$185**
- The slope, **0.5**, means that the weekly cost,  $C$ , increases by **\$0.50** when the number of miles driven,  $n$ , increases by **1**. The  $C$ -intercept means that when the number of miles driven is **0**, the

weekly cost is \$60.

d.

Figure 3.10.66

50) Loreen has a calligraphy business. The equation  $C = 1.8n + 35$  models the relation between her weekly cost,  $C$ , in dollars and the number of wedding invitations,  $n$ , that she writes.

- Find Loreen's cost for a week when she writes no invitations.
- Find the cost for a week when she writes 75 invitations.
- Interpret the slope and  $C$ -intercept of the equation.
- Graph the equation.

### Solution

a. \$35

b. \$170

c. The slope, 1.8, means that the weekly cost,  $C$ , increases by \$1.80 when the number of invitations,  $n$ , increases by 1.80.

The  $C$ -intercept means that when the number of invitations is 0, the weekly cost is \$35.

d.

Figure 3.10.67

## Use Slopes to Identify Parallel Lines

The slope of a line indicates how steep the line is and whether it rises or falls as we read it from left to right. Two lines that have the same slope are called **parallel lines**. Parallel lines never intersect.

Figure 3.10.68

We say this more formally in terms of the rectangular coordinate system. Two lines that have the same slope and different  $y$ -intercepts are called parallel lines. See Figure 3.10.69.

Verify that both lines have the same slope,  $m = \frac{2}{5}$ , and different  $y$ -intercepts.

Figure 3.10.69

What about vertical lines? The slope of a vertical line is undefined, so vertical lines don't fit in the definition above. We say that vertical lines that have different  $x$ -intercepts are parallel. See Figure 3.10.70.

Vertical lines with different  $x$ -intercepts are parallel.

Figure 3.10.70

## Parallel Lines

Parallel lines are lines in the same plane that do not intersect.

- Parallel lines have the same slope and different  $y$ -intercepts.
- If  $m_1$  and  $m_2$  are the slopes of two parallel lines then  $m_1 = m_2$ .
- Parallel vertical lines have different  $x$ -intercepts.

Let's graph the equations  $y = -2x + 3$  and  $2x + y = -1$  on the same grid. The first equation is already in slope-intercept form:  $y = -2x + 3$ . We solve the second equation for  $y$ :

$$2x + y = -1$$

$$y = -2x - 1$$

Graph the lines.

Figure 3.10.71

Notice the lines look parallel. What is the slope of each line? What is the  $y$ -intercept of each line?

---

$$y = mx + b$$

$$y = -2x + 3$$

$$m = -2$$

$$b = 3, (0, 3)$$

---

---

$$y = mx + b$$

$$y = -2x - 1$$

$$m = -2$$

$$b = -1, (0, -1)$$

---

The slopes of the lines are the same and the  $y$ -intercept of each line is different. So we know these lines are parallel.

Since parallel lines have the same slope and different  $y$ -intercepts, we can now just look at the slope-intercept form of the equations of lines and decide if the lines are parallel.

**Example 3.10.23**

Use slopes and  $y$ -intercepts to determine if the lines  $3x - 2y = 6$  and  $y = \frac{3}{2}x + 1$  are parallel.

**Solution**

**Step 1:** Solve the first equation for  $y$ .

$  \begin{aligned}  3x - 2y &= 6 \\  -2y &= -3x + 6 \\  \frac{-2y}{-2} &= \frac{-3x + 6}{-2} \\  y &= \frac{3}{2}x - 3  \end{aligned}  $	$y = \frac{3}{2}x + 1$
--	------------------------

**Step 2:** The equation is now in slope-intercept form.

$y = \frac{3}{2}x - 3$	
------------------------	--

**Step 3:** The equation of the second line is already in slope-intercept form.

	$y = \frac{3}{2}x + 1$
--	------------------------

**Step 4:** Identify the slope and  $y$ -intercept of both lines.

$y = mx + b$ $m = \frac{3}{2}$ $y = \frac{3}{2}x - 3$	$y = mx + b$ $m = \frac{3}{2}$ $y = \frac{3}{2}x + 1$ $y = \frac{3}{2}x + 1$
$y$ -intercept is $(0, -3)$	$y$ -intercept is $(0, 1)$

The lines have the same slope and different  $y$ -intercepts and so they are parallel. You may want to graph the lines to confirm whether they are parallel.

## Try It

51) Use slopes and  $y$ -intercepts to determine if the lines  $2x + 5y = 5$  and  $y = -\frac{2}{5}x - 4$  are parallel.

**Solution**

parallel

52) Use slopes and  $y$ -intercepts to determine if the lines  $4x - 3y = 6$  and  $y = \frac{4}{3}x - 1$  are parallel.

**Solution**

parallel

**Example 3.10.24**

Use slopes and  $y$ -intercepts to determine if the lines  $y = -4$  and  $y = 3$  are parallel.

**Solution**

$y = -4$	$y = 3$
----------	---------

**Step 1: Write each equation in slope-intercept form.**

Since there is no  $x$  term we write  $0x$ .

$y = 0x - 4$	$y = 0x + 3$
--------------	--------------

**Step 2: Identify the slope and  $y$ -intercept of both lines.**

$m = 0$	$m = 0$
$y$ -intercept is $(0, -4)$	$y$ -intercept is $(0, 3)$

The lines have the same slope and different  $y$ -intercepts and so they are parallel.

There is another way you can look at this example. If you recognize right away from the equations that these are horizontal lines, you know their slopes are both  $0$ . Since the horizontal lines cross the  $y$ -axis at  $y = -4$  and at  $y = 3$ , we know the  $y$ -intercepts are  $(0, -4)$  and  $(0, 3)$ . The lines have the same slope and different  $y$ -intercepts and so they are parallel.

**Try It**

53) Use slopes and  $y$ -intercepts to determine if the lines  $y = 8$  and  $y = -6$  are parallel.

**Solution**

parallel

54) Use slopes and  $y$ -intercepts to determine if the lines  $y = 1$  and  $y = -5$  are parallel.

**Solution**

parallel

### Example 3.10.25

Use slopes and  $y$ -intercepts to determine if the lines  $x = -2$  and  $x = -5$  are parallel.

**Solution**

$$x = -2 \text{ and } x = -5$$

Since there is no  $y$ , the equations cannot be put in slope-intercept form. But we recognize them as equations of vertical lines. Their  $x$ -intercepts are  $-2$  and  $-5$ . Since their  $x$ -intercepts are different, the vertical lines are parallel.

### Try It

55) Use slopes and  $y$ -intercepts to determine if the lines  $x = 1$  and  $x = -5$  are parallel.

**Solution**

parallel

56) Use slopes and  $y$ -intercepts to determine if the lines  $x = 8$  and  $x = -6$  are parallel.

**Solution**

parallel

**Example 3.10.26**

Use slopes and  $y$ -intercepts to determine if the lines  $y = 2x - 3$  and  $-6x + 3y = -9$  are parallel. You may want to graph these lines, too, to see what they look like.

**Solution**

$y = 2x - 3$	$-6x + 3y = -9$
--------------	-----------------

**Step 1:** The first equation is already in slope-intercept form.

$y = 2x - 3$	
--------------	--

**Step 2:** Solve the second equation for  $y$ .

	$\begin{aligned} -6x + 3y &= -9 \\ 3y &= 6x - 9 \\ \frac{3y}{3} &= \frac{6x - 9}{3} \\ y &= 2x - 3 \end{aligned}$
--	---

**Step 3:** The second equation is now in slope-intercept form.

$y = 2x - 3$	$y = 2x - 3$
--------------	--------------

**Step 4:** Identify the slope and  $y$ -intercept of both lines.

$y = 2x - 3$ $y = mx + b$ $m = 2$	$y = 2x - 3$ $y = mx + b$ $m = 2$
$y$ -intercept is $(0, -3)$	$y$ -intercept is $(0, -3)$

The lines have the same slope, but they also have the same  $y$ -intercepts. Their equations represent the same line. They are not parallel; they are the same line.

## Try It

57) Use slopes and  $y$ -intercepts to determine if the lines  $y = -\frac{1}{2}x - 1$  and  $x + 2y = 2$  are parallel.

**Solution**

not parallel; same line

58) Use slopes and  $y$ -intercepts to determine if the lines  $y = \frac{3}{4}x - 3$  and  $3x - 4y = 12$  are parallel.

**Solution**

not parallel; same line

## Use Slopes to Identify Perpendicular Lines

Let's look at the lines whose equations are  $y = \frac{1}{4}x - 1$  and  $y = -4x + 2$ , shown in Figure 3.10.72.

Figure 3.10.72

These lines lie in the same plane and intersect in right angles. We call these lines **perpendicular**.

What do you notice about the slopes of these two lines? As we read from left to right, the line  $y = \frac{1}{4}x - 1$  rises, so its slope is positive. The line  $y = -4x + 2$  drops from left to right, so it has a **negative slope**. Does it make sense to you that the slopes of two perpendicular lines will have opposite signs?

If we look at the slope of the first line,  $m_1 = \frac{1}{4}$ , and the slope of the second line,  $m_2 = -4$ , we can see that they are *negative reciprocals* of each other. If we multiply them, their product is  $-1$ .

$$m_1 \cdot m_2$$

$$\frac{1}{4}(-4)$$

$$-1$$

This is always true for perpendicular lines and leads us to this definition.

## Perpendicular Lines

**Perpendicular lines** are lines in the same plane that form a right angle.

If  $m_1$  and  $m_2$  are the slopes of two perpendicular lines, then:

$$m_1 \cdot m_2 = -1 \text{ and } m_1 = -\frac{1}{m_2}$$

Vertical lines and horizontal lines are always perpendicular to each other.

We were able to look at the slope–intercept form of linear equations and determine whether or not the lines were parallel. We can do the same thing for perpendicular lines.

We find the slope–intercept form of the equation, and then see if the slopes are negative reciprocals. If the product of the slopes is  $-1$ , the lines are perpendicular. Perpendicular lines may have the same  $y$ -intercepts.

### Example 3.10.27

Use slopes to determine if the lines,  $y = -5x - 4$  and  $x - 5y = 5$  are perpendicular.

**Solution**

**Step 1:** The first equation is already in slope–intercept form.

$y = -5x - 4$	
---------------	--

**Step 2:** Solve the second equation for  $y$ .

	$x - 5y = 5$ $-5y = x + 5$ $\frac{-5y}{-5} = \frac{x + 5}{-5}$ $y = \frac{1}{-5}x - 1$
--	--

**Step 3: Identify the slope of each line.**

$y = -5x - 4$ $y = mx + b$ $m_1 = -5$	$y = \frac{1}{5}x - 4$ $y = mx + b$ $m_2 = \frac{1}{5}$
---------------------------------------	---

The slopes are negative reciprocals of each other, so the lines are perpendicular. We check by multiplying the slopes,

$$\begin{aligned}
 m_1 \cdot m_2 &= -5\left(\frac{1}{5}\right) \\
 &= -1
 \end{aligned}$$

## Try It

59) Use slopes to determine if the lines  $y = -3x + 2$  and  $x - 3y = 4$  are perpendicular.

**Solution**

perpendicular

60) Use slopes to determine if the lines  $y = 2x - 5$  and  $x + 2y = -6$  are perpendicular.

**Solution**

perpendicular

**Example 3.10.28**

Use slopes to determine if the lines,  $7x + 2y = 3$  and  $2x + 7y = 5$  are perpendicular.

**Solution**

**Step 1: Solve the equations for  $y$ .**

$7x + 2y = 3$ $2y = -7x + 3$ $\frac{2y}{2} = \frac{-7x + 3}{2}$ $y = \frac{-7}{2}x + \frac{3}{2}$	$2x + 7y = 5$ $7y = -2x + 5$ $\frac{7y}{7} = \frac{-2x + 5}{7}$ $y = \frac{-2}{7}x + \frac{5}{7}$
---	---

**Step 2: Identify the slope of each line.**

$y = mx + b$ $m_1 = -\frac{7}{2}$	$y = mx + b$ $m_2 = -\frac{2}{7}$
-----------------------------------	-----------------------------------

The slopes are reciprocals of each other, but they have the same sign. Since they are not negative reciprocals, the lines are not perpendicular.

## Try It

61) Use slopes to determine if the lines  $5x + 4y = 1$  and  $4x + 5y = 3$  are perpendicular.

**Solution**

not perpendicular

62) Use slopes to determine if the lines  $2x - 9y = 3$  and  $9x - 2y = 1$  are perpendicular.

**Solution**

not perpendicular

## Key Concepts

- **Find the Slope of a Line from its Graph using**  $m = \frac{\text{rise}}{\text{run}}$

1. Locate two points on the line whose coordinates are integers.
2. Starting with the point on the left, sketch a right triangle, going from the first point to the second point.
3. Count the rise and the run on the legs of the triangle.
4. Take the ratio of rise to run to find the slope.

- **Graph a Line Given a Point and the Slope**

1. Plot the given point.
2. Use the slope formula  $m = \frac{\text{rise}}{\text{run}}$  to identify the rise and the run.
3. Starting at the given point, count out the rise and run to mark the second point.

4. Connect the points with a line.

- **Slope of a Horizontal Line**

- The slope of a horizontal line,  $y = b$ , is 0.

- **Slope of a vertical line**

- The slope of a vertical line,  $x = a$ , is undefined

### Graph a Line Using its Slope and $y$ -Intercept

1. The slope-intercept form of an equation of a line with slope  $m$  and  $y$ -intercept,  $(0, b)$  is,  $y = mx + b$ .
2. Find the slope-intercept form of the equation of the line.
3. Identify the slope and  $y$ -intercept.
4. Plot the  $y$ -intercept.
5. Use the slope formula  $m = \frac{\text{rise}}{\text{run}}$  to identify the rise and the run.
6. Starting at the  $y$ -intercept, count out the rise and run to mark the second point.
7. Connect the points with a line.

- **Strategy for Choosing the Most Convenient Method to Graph a Line:**

Consider the form of the equation.

- If it only has one variable, it is a vertical or horizontal line.  
 $x = a$  is a vertical line passing through the  $x$ -axis at  $a$ .  
 $y = b$  is a horizontal line passing through the  $y$ -axis at  $b$ .
- If  $y$  is isolated on one side of the equation, in the form  $y = mx + b$ , graph by using the slope and  $y$ -intercept.  
 Identify the slope and  $y$ -intercept and then graph.
- If the equation is of the form  $Ax + By = C$ , find the intercepts.  
 Find the  $x$ -intercept and  $y$ -intercept, a third point, and then graph.

- **Parallel lines** are lines in the same plane that do not intersect.

- Parallel lines have the same slope and different  $y$ -intercepts.
  - If  $m_1$  and  $m_2$  are the slopes of two parallel lines then  $m_1 = m_2$ .

- Parallel vertical lines have different  $x$ -intercepts.
- **Perpendicular lines** are lines in the same plane that form a right angle.
  - If  $m_1$  and  $m_2$  are the slopes of two perpendicular lines, then  $m_1 \cdot m_2 = -1$  and  $m_1 = -\frac{1}{m_2}$
  - Vertical lines and horizontal lines are always perpendicular to each other.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=1863#h5p-24>

On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

## Glossary

### geoboard

A geoboard is a board with a grid of pegs on it.

**negative slope**

A negative slope of a line goes down as you read from left to right.

**positive slope**

A positive slope of a line goes up as you read from left to right.

**rise**

The rise of a line is its vertical change.

**run**

The run of a line is its horizontal change.

**slope formula**

The slope of the line between two points  $(x_1, y_1)$  and  $(x_2, y_2)$  is  $m = \frac{y_2 - y_1}{x_2 - x_1}$

**slope of a line**

The slope of a line is  $m = \frac{\text{rise}}{\text{run}}$ . The rise measures the vertical change and the run measures the horizontal change.

**parallel lines**

Lines in the same plane that do not intersect.

**perpendicular lines**

Lines in the same plane that form a right angle.

**slope-intercept form of an equation of a line**

The slope-intercept form of an equation of a line with slope  $m$  and  $y$ -intercept,  $(0, b)$  is,  
 $y = mx + b$ .

## 3.11 FIND THE EQUATION OF A LINE

---

### Learning Objectives

By the end of this section, you will be able to:

- Find an equation of the line given the slope and  $y$ -intercept
- Find an equation of the line given the slope and a point
- Find an equation of the line given two points
- Find an equation of a line parallel to a given line
- Find an equation of a line perpendicular to a given line

### Try It

Before you get started, take this readiness quiz:

1) Solve:  $\frac{2}{3} = \frac{x}{5}$

2) Simplify:  $-\frac{2}{5}(x - 15)$

How do online retailers know that ‘you may also like’ a particular item based on something you just ordered? How can economists know how a rise in the minimum wage will affect the unemployment rate? How do medical researchers create drugs to target cancer cells? How can traffic engineers predict the effect on your commuting time of an increase or decrease in gas prices? It’s all mathematics.

You are at an exciting point in your mathematical journey as the mathematics you are studying has interesting applications in the real world.

The physical sciences, social sciences, and the business world are full of situations that can be modelled with linear equations relating two variables. Data is collected and graphed. If the data points appear to form a straight line, an equation of that line can be used to predict the value of one variable based on the value of the other variable.

To create a mathematical model of a linear relation between two variables, we must be able to find the equation of the line. In this section we will look at several ways to write the equation of a line. The specific method we use will be determined by what information we are given.

## Find an Equation of the Line Given the Slope and $y$ -Intercept

We can easily determine the slope and intercept of a line if the equation was written in slope–intercept form,  $y = mx + b$ . Now, we will do the reverse—we will start with the slope and  $y$ -intercept and use them to find the equation of the line.

### Example 3.11.1

Find an equation of a line with slope  $-7$  and  $y$ -intercept  $(0, -1)$ .

#### Solution

Since we are given the slope and  $y$ -intercept of the line, we can substitute the needed values into the slope–intercept form,  $y = mx + b$ .

**Step 1: Name the slope.**

$$m = -7$$

**Step 2: Name the  $y$ -intercept.**

$$y\text{-intercept} = (0, -1)$$

**Step 3: Substitute the values into  $y = mx + b$ .**

$$y = mx + b$$

$$y = -7x + (-1)$$

$$y = -7x - 1$$

## Try It

3) Find an equation of a line with slope  $\frac{2}{5}$  and  $y$ -intercept  $(0, 4)$ .

**Solution**

$$y = \frac{2}{5}x + 4$$

4) Find an equation of a line with slope  $-1$  and  $y$ -intercept  $(0, -3)$ .

**Solution**

$$y = -x - 3$$

Sometimes, the slope and intercept need to be determined from the graph.

## Example 3.11.2

Find the equation of the line shown.

Figure 3.11.1

**Solution**

We need to find the slope and  $y$ -intercept of the line from the graph so we can substitute the needed values into the slope-intercept form,  $y = mx + b$ .

To find the slope, we choose two points on the graph.

The  $y$ -intercept is  $(0, -4)$  and the graph passes through  $(3, -2)$ .

**Step 1: Find the slope by counting the rise and run.**

$$m = \frac{\text{rise}}{\text{run}}$$

$$m = \frac{2}{3}$$

**Step 2: Find the  $y$ -intercept.**

$$y\text{-intercept} = (0, -4)$$

**Step 3: Substitute the values into  $y = mx + b$ .**

$$y = mx + b$$

$$y = \frac{2}{3}x - 4$$

## Try It

5) Find the equation of the line shown in the graph.

Figure 3.11.2

### Solution

$$y = \frac{3}{5}x + 1$$

6) Find the equation of the line shown in the graph.

Figure 3.11.3

**Solution**

$$y = \frac{4}{3}x - 5$$

## Find an Equation of the Line Given the Slope and a Point

Finding an equation of a line using the slope–intercept form of the equation works well when you are given the slope and  $y$ -intercept or when you read them off a graph. But what happens when you have another point instead of the  $y$ -intercept?

We are going to use the slope formula to derive another form of an equation of the line. Suppose we have a line that has slope  $m$  and that contains some specific point  $(x_1, y_1)$  and some other point, which we will just call  $(x, y)$ . We can write the slope of this line and then change it to a different form.

$$m = \frac{y - y_1}{x - x_1}$$

Step 1: Multiply both sides of the equation by  $(x - x_1)$ .

$$m(x - x_1) = \left(\frac{y - y_1}{x - x_1}\right)(x - x_1)$$

Step 2: Simplify.

$$m(x - x_1) = y - y_1$$

Step 3: Rewrite the equation with the  $y$  terms on the left.

$$(y - y_1) = m(x - x_1)$$

This format is called the **point–slope form** of an equation of a line.

## Point–slope Form of an Equation of a Line

The point–slope form of an equation of a line with slope  $m$  and containing the point  $(x_1, y_1)$  is

$$y - y_1 = m(x - x_1).$$

We can use the point–slope form of an equation to find an equation of a line when we are given the slope and one point. Then we will rewrite the equation in slope–intercept form. Most applications of linear equations use the the slope–intercept form.

### Example 3.11.3

Find an equation of a line with slope  $m = \frac{2}{5}$  that contains the point  $(10, 3)$ . Write the equation in slope–intercept form.

#### Solution

##### Step 1: Identify the slope.

The slope is given.

$$m = \frac{2}{5}$$

##### Step 2: Identify the point.

The point is given.

$$\begin{pmatrix} x_1 & y_1 \\ 10, & 3 \end{pmatrix}$$

**Step 3: Substitute the values into the point–slope form,  $y - y_1 = m(x - x_1)$ .**

$$y - y_1 = m(x - x_1)$$

$$y - 3 = \frac{2}{5}(x - 10)$$

Simplify.  $y - 3 = \frac{2}{5}x - 4$

**Step 4: Write the equation in slope-intercept form.**

$$y = \frac{2}{5}x - 1$$

## Try It

7) Find an equation of a line with slope  $m = \frac{5}{6}$  and containing the point  $(6, 3)$ .

**Solution**

$$y = \frac{5}{6}x - 2$$

8) Find an equation of a line with slope  $m = \frac{2}{3}$  and containing the point  $(9, 2)$ .

**Solution**

$$y = \frac{2}{3}x - 4$$

## HOW TO

Find an equation of a line given the slope and a point.

1. Identify the slope.
2. Identify the point.
3. Substitute the values into the point-slope form,  $y - y_1 = m(x - x_1)$ .
4. Write the equation in slope-intercept form.

### Example 3.11.4

Find an equation of a line with slope  $m = -\frac{1}{3}$  that contains the point  $(6, -4)$ . Write the equation in slope-intercept form.

#### Solution

Since we are given a point and the slope of the line, we can substitute the needed values into the point-slope form,  $y - y_1$

**Step 1: Identify the slope.**

$$m = -\frac{1}{3}$$

**Step 2: Identify the point.**

$$\left( \overset{x_1}{6}, \overset{y_1}{-4} \right)$$

**Step 3: Substitute the values into  $y - y_1 = m(x - x_1)$**

$$\begin{aligned} y - y_1 &= m(x - x_1) \\ y - (-4) &= -\frac{1}{3}(x - 6) \end{aligned}$$

**Step 4: Simplify.**

$$y - 4 = -\frac{1}{3}x - 6$$

**Step 5: Write in slope–intercept form.**

$$y = -\frac{1}{3}x - 2$$

## Try It

9) Find an equation of a line with slope  $m = -\frac{2}{5}$  and containing the point  $(10, -5)$ .

**Solution**

$$y = -\frac{2}{5}x - 1$$

10) Find an equation of a line with slope  $m = -\frac{3}{4}$ , and containing the point  $(4, -7)$ .

**Solution**

$$y = -\frac{3}{4}x - 4$$

## Example 3.11.5

Find an equation of a horizontal line that contains the point  $(-1, 2)$ . Write the equation in slope–intercept form.

**Solution**

Every horizontal line has slope **0**. We can substitute the slope and points into the point-slope form,  
 $y - y_1 = m(x - x_1)$ .

**Step 1: Identify the slope.**

$$m = 0$$

**Step 2: Identify the point.**

$$\left( \overset{x_1}{-1}, \overset{y_1}{2} \right)$$

**Step 3: Substitute the values into  $y - y_1 = m(x - x_1)$ .**

$$y - \overset{y_1}{2} = \overset{m}{0}(x - \overset{x_1}{-1})$$

$$y - 2 = 0(x - (-1))$$

$$\text{Simplify.} \quad y - 2 = (x + 1)$$

$$y - 2 = 0$$

$$y = 2$$

**Step 4: Write in slope-intercept form.**

It is in **y**-form, but could be written  $y = 0x + 2$ .

Did we end up with the form of a horizontal line,  $y = a$ ?

## Try It

11) Find an equation of a horizontal line containing the point  $(-3, 8)$ .

**Solution**

$$y = 8$$

12) Find an equation of a horizontal line containing the point  $(-1, 4)$ .

**Solution**

$$y = 4$$

## Find an Equation of the Line Given Two Points

When real-world data is collected, a linear model can be created from two data points. In the next example we'll see how to find an equation of a line when just two points are given.

We have two options so far for finding an equation of a line: slope–intercept or point–slope. Since we will know two points, it will make more sense to use the point–slope form.

But then we need the slope. Can we find the slope with just two points? Yes. Then, once we have the slope, we can use it and one of the given points to find the equation.

### Example 3.11.6

Find an equation of a line that contains the points  $(5, 4)$  and  $(3, 6)$ . Write the equation in slope–intercept form.

#### Solution

##### Step 1: Find the slope using the given points.

Find the slope of the line through  $(5, 4)$  and  $(3, 6)$

$$\begin{aligned} m &= \frac{y_2 - y_1}{x_2 - x_1} \\ m &= \frac{6 - 4}{3 - 5} \\ m &= \frac{2}{-2} \\ m &= -1 \end{aligned}$$

##### Step 2: Choose one point.

Chose either point.

$$\begin{pmatrix} x_1 & y_1 \\ 5, & 4 \end{pmatrix}$$

##### Step 3: Substitute the values into the point-slope form, $y - y_1 = m(x - x_1)$ .

$$\begin{aligned} y - y_1 &= m(x - x_1) \\ y - 4 &= -1(x - 5) \\ y - 4 &= -1x + 5 \\ y &= -1x + 9 \end{aligned}$$

**Step 4: Write the equation in slope-intercept form.**

$$y = -1x + 9$$

Use the point  $(3, 6)$  and see that you get the same equation.

## Try It

13) Find an equation of a line containing the points  $(3, 1)$  and  $(5, 6)$ .

**Solution**

$$y = \frac{5}{2}x - \frac{13}{2}$$

14) Find an equation of a line containing the points  $(1, 4)$  and  $(6, 2)$ .

**Solution**

$$y = -\frac{2}{5}x + \frac{22}{5}$$

## HOW TO

**Find an equation of a line given two points.**

1. Find the slope using the given points.
2. Choose one point.
3. Substitute the values into the point-slope form,  $y - y_1 = m(x - x_1)$ .
4. Write the equation in slope-intercept form.

### Example 3.11.7

Find an equation of a line that contains the points  $(-3, -1)$  and  $(2, -2)$ . Write the equation in slope-intercept form.

#### Solution

Since we have two points, we will find an equation of the line using the point-slope form. The first step will be to find the slope.

**Step 1: Find the slope of the line through  $(-3, -1)$  and  $(2, -2)$ .**

$$\begin{aligned} m &= \frac{y_2 - y_1}{x_2 - x_1} \\ m &= \frac{-2 - (-1)}{2 - (-3)} \\ m &= \frac{-1}{5} \\ m &= \frac{-1}{5} \end{aligned}$$

**Step 2: Choose either point.**

$$\left( \overset{x_1}{2}, \overset{y_1}{-2} \right)$$

**Step 3: Substitute the values into  $y - y_1 = m(x - x_1)$ .**

$$\begin{aligned} y - y_1 &= m(x - x_1) \\ y - \overset{y_1}{(-2)} &= \overset{m}{-\frac{1}{5}}(x - \overset{x_1}{2}) \\ y + 2 &= -\frac{1}{5}x + \frac{2}{5} \end{aligned}$$

**Step 4: Write in slope-intercept form.**

$$y = -\frac{1}{5}x - \frac{8}{5}$$

## Try It

15) Find an equation of a line containing the points  $(-2, -4)$  and  $(1, -3)$ .

**Solution**

$$y = \frac{1}{3}x - \frac{10}{3}$$

16) Find an equation of a line containing the points  $(-4, -3)$  and  $(1, -5)$ .

**Solution**

$$y = -\frac{2}{5}x - \frac{23}{5}$$

## Example 3.11.8

Find an equation of a line that contains the points  $(-2, 4)$  and  $(-2, -3)$ . Write the equation in slope-intercept form.

**Solution**

Again, the first step will be to find the slope.

Find the slope of the line through  $(-2, 4)$  and  $(-2, -3)$

$$\begin{aligned} m &= \frac{y_2 - y_1}{x_2 - x_1} \\ m &= \frac{-3 - 4}{-2 - (-2)} \\ m &= \frac{-7}{0} \end{aligned}$$

The slope is undefined.

This tells us it is a vertical line. Both of our points have an  $x$ -coordinate of  $-2$ . So our equation of the line is  $x = -2$ . Since there is no  $y$ , we cannot write it in slope–intercept form.

You may want to sketch a graph using the two given points. Does the graph agree with our conclusion that this is a vertical line?

## Try It

17) Find an equation of a line containing the points  $(5, 1)$  and  $(5, -4)$ .

**Solution**

$$x = 5$$

18) Find an equation of a line containing the points  $(-4, 4)$  and  $(-4, 3)$ .

**Solution**

$$x = -4$$

We have seen that we can use either the slope–intercept form or the point–slope form to find an equation of a line. Which form we use will depend on the information we are given. This is summarized in the table below.

To Write an Equation of a Line		
If given:	Use:	Form:
Slope and $y$ -intercept	slope–intercept	$y = mx + b$
Slope and a point	point–slope	$y - y_1 = m(x - x_1)$
Two points	point–slope	$y - y_1 = m(x - x_1)$

## Find an Equation of a Line Parallel to a Given Line

Suppose we need to find an equation of a line that passes through a specific point and is parallel to a given line.

We can use the fact that parallel lines have the same slope. So we will have a point and the slope—just what we need to use the point–slope equation.

First let's look at this graphically.

The graph shows the graph of  $y = 2x - 3$ . We want to graph a line parallel to this line and passing through the point  $(-2, 1)$ .

Figure 3.11.4

We know that parallel lines have the same slope. So the second line will have the same slope as  $y = 2x - 3$ . That slope is  $m_{\parallel} = 2$ . We'll use the notation  $m$  to represent the slope of a line parallel to a line with slope  $m$ . (Notice that the subscript  $\parallel$  looks like two parallel lines.)

The second line will pass through  $(-2, 1)$  and have  $m = 2$ . To graph the line, we start at  $(-2, 1)$  and count out the rise and run. With  $m = 2$  (or  $m = \frac{2}{1}$ ), we count out the rise 2 and the run 1. We draw the line.

Figure 3.11.5

Do the lines appear parallel? Does the second line pass through  $(-2, 1)$ ?

Now, let's see how to do this algebraically.

We can use either the slope–intercept form or the point–slope form to find an equation of a line. Here we know one point and can find the slope. So we will use the point–slope form.

### Example 3.11.9

Find an equation of a line parallel to  $y = 2x - 3$  that contains the point  $(-2, 1)$ . Write the equation in slope–intercept form.

#### Solution

##### Step 1: Find the slope of the given line.

The line is in slope–intercept form,  $y = 2x - 3$ .

$$m = 2$$

##### Step 2: Find the slope of the parallel line.

Parallel lines have the same slope.

$$m_2 = 2$$

**Step 3: Identify the point.**

The given point is,  $(-2, 1)$ .

$$\begin{pmatrix} x_1 & y_1 \\ -2, & 1 \end{pmatrix}$$

**Step 4: Substitute the values into the point-slope form,  $y - y_1 = m(x - x_1)$ .**

Simplify.

$$\begin{aligned} y - y_1 &= m(x - x_1) \\ y - 1 &= 2(x - (-2)) \\ y - 1 &= 2(x + 2) \\ y - 1 &= 2x + 4 \end{aligned}$$

**Step 5: Write the equation in slope-intercept form.**

$$y = 2x + 5$$

Does this equation make sense? What is the  $y$ -intercept of the line? What is the slope?

**Try It**

19) Find an equation of a line parallel to the line  $y = 3x + 1$  that contains the point  $(4, 2)$ . Write the equation in slope-intercept form.

**Solution**

$$y = 3x - 10$$

20) Find an equation of a line parallel to the line  $y = \frac{1}{2}x - 3$  that contains the point  $(6, 4)$ .

**Solution**

$$y = \frac{1}{2}x + 1$$

## HOW TO

### Find an equation of a line parallel to a given line.

1. Find the slope of the given line.
2. Find the slope of the parallel line.
3. Identify the point.
4. Substitute the values into the point-slope form,  $y - y_1 = m(x - x_1)$ .
5. Write the equation in slope-intercept form.

## Find an Equation of a Line Perpendicular to a Given Line

Now, let's consider perpendicular lines. Suppose we need to find a line passing through a specific point and which is perpendicular to a given line. We can use the fact that perpendicular lines have slopes that are negative reciprocals. We will again use the point-slope equation, like we did with parallel lines.

The graph shows the graph of  $y = 2x - 3$ . Now, we want to graph a line perpendicular to this line and passing through  $(-2, 1)$ .

Figure 3.11.6

We know that perpendicular lines have slopes that are negative reciprocals. We'll use the notation  $m_{\perp}$  to represent the slope of a line perpendicular to a line with slope  $m$ . (Notice that the subscript  $\perp$  looks like the right angles made by two perpendicular lines.)

$$y = 2x - 3 \quad \text{perpendicular line}$$

$$m = 2 \quad m_{\perp} = -\frac{1}{2}$$

We now know the perpendicular line will pass through  $(-2, 1)$  with  $m_{\perp} = -\frac{1}{2}$

To graph the line, we will start at  $(-2, 1)$  and count out the rise  $-1$  and the run  $2$ . Then we draw the line.

Figure 3.11.7

Do the lines appear perpendicular? Does the second line pass through  $(-2, 1)$ ?

Now, let's see how to do this algebraically. We can use either the slope-intercept form or the point-slope form to find an equation of a line. In this example we know one point, and can find the slope, so we will use the point-slope form.

**Example 3.11.10**

Find an equation of a line perpendicular to  $y = 2x - 3$  that contains the point  $(-2, 1)$ . Write the equation in slope-intercept form.

**Solution****Step 1: Find the slope of the given line.**

The line is in slope-intercept form,  $y = 2x - 3$ .

$$m = 2$$

**Step 2: Find the slope of the perpendicular line.**

The slopes of perpendicular lines are negative reciprocals.

$$m_{\perp} = -\frac{1}{2}$$

**Step 3: Identify the point.**

The given point is,  $(-2, 1)$

$$\begin{pmatrix} x_1 & y_1 \\ -2, & 1 \end{pmatrix}$$

**Step 4: Substitute the values into the point-slope form,  $y - y_1 = m(x - x_1)$ .**

Simplify.

$$y - y_1 = m(x - x_1)$$

$$y - 1 = -\frac{1}{2}(x - (-2))$$

$$y - 1 = -\frac{1}{2}(x + 2)$$

$$y - 1 = -\frac{1}{2}x - 1$$

**Step 5: Write in slope-intercept form.**

$$y = -\frac{1}{2}x$$

## Try It

21) Find an equation of a line perpendicular to the line  $y = 3x + 1$  that contains the point  $(4, 2)$ . Write the equation in slope-intercept form.

**Solution**

$$y = -\frac{1}{3}x + \frac{10}{3}$$

22) Find an equation of a line perpendicular to the line  $y = \frac{1}{2}x - 3$  that contains the point  $(6, 4)$ .

**Solution**

$$y = -2x + 16$$

## HOW TO

**Find an equation of a line perpendicular to a given line.**

1. Find the slope of the given line.
2. Find the slope of the perpendicular line.
3. Identify the point.
4. Substitute the values into the point-slope form,  $y - y_1 = m(x - x_1)$ .
5. Write the equation in slope-intercept form.

**Example 3.11.11**

Find an equation of a line perpendicular to  $x = 5$  that contains the point  $(3, -2)$ . Write the equation in slope-intercept form.

**Solution**

Again, since we know one point, the point-slope option seems more promising than the slope-intercept option. We need the slope to use this form, and we know the new line will be perpendicular to  $x = 5$ . This line is vertical, so its perpendicular will be horizontal. This tells us the  $m_{\perp} = 0$ .

**Step 1: Identify the point.**

$$(3, -2)$$

**Step 2: Identify the slope of the perpendicular line.**

$$m_{\perp} = 0$$

**Step 3: Substitute the values into  $y - y_1 = m(x - x_1)$ .**

$$\begin{aligned} y - y_1 &= m(x - x_1) \\ y - (-2) &= 0(x - 3) \\ y + 2 &= 0 \\ y &= -2 \end{aligned}$$

**Step 4: Simplify.**

$$y = -2$$

Sketch the graph of both lines. Do they appear to be perpendicular?

**Try It**

23) Find an equation of a line that is perpendicular to the line  $x = 4$  that contains the point  $(4, -5)$ . Write the equation in slope-intercept form.

**Solution**

$$y = -5$$

24) Find an equation of a line that is perpendicular to the line  $x = 2$  that contains the point  $(2, -1)$ . Write the equation in slope-intercept form.

**Solution**

$$y = -1$$

In Example 3.11.11, we used the point-slope form to find the equation. We could have looked at this in a different way.

We want to find a line that is perpendicular to  $x = 5$  that contains the point  $(3, -2)$ . The graph shows us the line  $x = 5$  and the point  $(3, -2)$ .

Figure 3.11.8

We know every line perpendicular to a vertical line is horizontal, so we will sketch the horizontal line through  $(3, -2)$ .

Figure 3.11.9

Do the lines appear perpendicular?

If we look at a few points on this horizontal line, we notice they all have  $y$ -coordinates of  $-2$ . So, the equation of the line perpendicular to the vertical line  $x = 5$  is  $y = -2$ .

### Example 3.11.12

Find an equation of a line that is perpendicular to  $y = -4$  that contains the point  $(-4, 2)$ . Write the equation in slope-intercept form.

#### Solution

The line  $y = -4$  is a horizontal line. Any line perpendicular to it must be vertical, in the form  $x = a$ . Since the perpendicular line is vertical and passes through  $(-4, 2)$ , every point on it has an  $x$ -coordinate of  $-4$ . The equation of the perpendicular line is  $x = -4$ . You may want to sketch the lines. Do they appear perpendicular?

## Try It

25) Find an equation of a line that is perpendicular to the line  $y = 1$  that contains the point  $(-5, 1)$ . Write the equation in slope-intercept form.

**Solution**

$$x = -5$$

26) Find an equation of a line that is perpendicular to the line  $y = -5$  that contains the point  $(-4, -5)$ .

**Solution**

$$x = -4$$

Access this online resource for additional instruction and practice with finding the equation of a line.

- [Use the Point-Slope Form of an Equation of a Line](#)

## Key Concepts

- **To Find an Equation of a Line Given the Slope and a Point**

1. Identify the slope.

2. Identify the point.
3. Substitute the values into the point-slope form,  $y - y_1 = m(x - x_1)$ .
4. Write the equation in slope-intercept form.

- **To Find an Equation of a Line Given Two Points**

1. Find the slope using the given points.
2. Choose one point.
3. Substitute the values into the point-slope form,  $y - y_1 = m(x - x_1)$ .
4. Write the equation in slope-intercept form.

- **To Write an Equation of a Line**

- If given slope and  $y$ -intercept, use slope-intercept form  $y = mx + b$ .
- If given slope and a point, use point-slope form  $y - y_1 = m(x - x_1)$ .
- If given two points, use point-slope form  $y - y_1 = m(x - x_1)$ .

- **To Find an Equation of a Line Parallel to a Given Line**

1. Find the slope of the given line.
2. Find the slope of the parallel line.
3. Identify the point.
4. Substitute the values into the point-slope form,  $y - y_1 = m(x - x_1)$ .
5. Write the equation in slope-intercept form.

- **To Find an Equation of a Line Perpendicular to a Given Line**

- Find the slope of the given line.
- Find the slope of the perpendicular line.
- Identify the point.
- Substitute the values into the point-slope form,  $y - y_1 = m(x - x_1)$ .
- Write the equation in slope-intercept form.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=2019#h5p-25>

On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

## Glossary

### point-slope form

The point-slope form of an equation of a line with slope  $m$  and containing the point  $(x_1, y_1)$  is  $y - y_1 = m(x - x_1)$ .

## 3.12 LINEAR FUNCTIONS AND APPLICATIONS OF LINEAR FUNCTIONS

### Learning Objectives

In this section you will:

- Represent a linear function.
- Write and interpret an equation for a linear function.
- Model real-world problems with linear functions.
- Build linear models from verbal descriptions.
- Model a set of data with a linear function.

Just as with the growth of a bamboo plant, there are many situations that involve constant change over time. Consider, for example, the first commercial maglev train in the world, the Shanghai MagLev Train Figure 3.12.1. It carries passengers comfortably for a 30-kilometer trip from the airport to the subway station in only eight minutes<sup>1</sup>.

Suppose a maglev train travels a long distance, and maintains a constant speed of 83 meters per second for a period of time once it is 250 meters from the station. How can we analyze the train's distance from the station as a function of time? In this section, we will investigate a kind

Figure 3.12.1 [Shanghai MagLev Train](#) by Jody McIntyre CC-BY-SA 2.0

1. <http://www.chinahighlights.com/shanghai/transportation/maglev-train.htm>

of function that is useful for this purpose, and use it to investigate real-world situations such as the train's distance from the station at a given point in time.

## Representing Linear Functions

The function describing the train's motion is a **linear function**, which is defined as a function with a constant rate of change. This is a polynomial of degree 1. There are several ways to represent a linear function, including word form, function notation, tabular form, and graphical form. We will describe the train's motion as a function using each method.

### Representing a Linear Function in Word Form

Let's begin by describing the linear function in words. For the train problem, we just considered, the following word sentence may be used to describe the function relationship.

- *The train's distance from the station is a function of the time during which the train moves at a constant speed plus its original distance from the station when it began moving at constant speed.*

The speed is the rate of change. Recall that a rate of change is a measure of how quickly the dependent variable changes with respect to the independent variable. The rate of change for this example is constant, which means that it is the same for each input value. As the time (input) increases by 1 second, the corresponding distance (output) increases by 83 meters. The train began moving at this constant speed at a distance of 250 meters from the station.

### Representing a Linear Function in Function Notation

Another approach to representing linear functions is by using function notation. One example of function notation is an equation written in the slope-intercept form of a line, where  $x$  is the input value,  $m$  is the rate of change, and  $b$  is the initial value of the dependent variable.

Equation form	$y = mx + b$
Function notation	$f(x) = mx + b$

In the example of the train, we might use the notation  $D$  where the total distance  $D$  is a function of the time

$t$ . The rate,  $m$ , is 83 meters per second. The initial value of the dependent variable  $b$  is the original distance from the station, 250 meters. We can write a generalized equation to represent the motion of the train.

$$D = 83t + 250.$$

## Representing a Linear Function in Tabular Form

A third method of representing a linear function is through the use of a table. The relationship between the distance from the station and the time is represented in Figure 3.12.2. From the table, we can see that the distance changes by 83 meters for every 1 second increase in time.

Table with the first row, labeled  $t$ , containing the seconds from 0, 1, 2, 3, and with the second row, labeled  $D(t)$ , containing the meters 250, 333, 416, and 499. Each value in the first row increases by 1 second, and each value in the second row increases by 83 meters.

Figure 3.12.2 Tabular representation of the function  $D$  showing selected input and output values

### Can the input in the previous example be any real number?

*No. The input represents time so while nonnegative rational and irrational numbers are possible, negative real numbers are not possible for this example. The input consists of non-negative real numbers.*

## Representing a Linear Function in Graphical Form

Another way to represent linear functions is visually, using a graph. We can use the function relationship from above,  $D(t) = 83t + 250$ , to draw a graph as represented in Figure 3.12.3 Notice the graph is a line. When we plot a linear function, the graph is always a line.

The rate of change, which is constant, determines the slant, or slope of the line. The point at which the input value is zero is the vertical intercept, or  $y$ -intercept, of the line. We can see from the graph that the  $y$ -intercept in the train example we just saw is  $(0, 250)$  and represents the distance of the train from the station when it began moving at a constant speed.

This is a graph with y-axis labeled “Distance (m)” and x-axis labeled “Time (s).”

The x-axis spans from 0 to 5 and is marked in increments of one. The y-axis spans from 0 to 500 and is marked in increments of one hundred. The graph shows an increasing function. As time increases, distance also increases. The line is graphed along the points (0, 250) and (1, 333)

Figure 3.12.3 The graph of  $t=83t+250$ . Graphs of linear functions are lines because the rate of change is constant.

Notice that the graph of the train example is restricted, but this is not always the case. Consider the graph of the line  $f(x) = 2x + 1$ .

Ask yourself what numbers can be input to the function. In other words, what is the domain of the function? The domain is comprised of all real numbers because any number may be doubled, and then have one added to the product.

## Linear Function

A linear function is a function whose graph is a line. Linear functions can be written in the slope-intercept form of a line

$$f(x) = mx + b$$

where  $b$  is the initial or starting value of the function (when input,  $x = 0$ ), and  $m$ , is the constant rate of change, or slope of the function. The  $y$ -intercept is at  $(0, b)$ .

### Example 3.12.1.

#### Using a Linear Function to Find the Pressure on a Diver

The pressure,  $P$  in pounds per square inch (PSI) on the diver in Figure 3.12.4 depends upon her

depth below the water surface,  $d$  in feet. This relationship may be modelled by the equation,  $P(d) = 0.434d + 14.696$ . Restate this function in words.

Figure 3.12.4 Photo by [Adam Reeder](#) CC-BY-NC 2.0

### Solution

To restate the function in words, we need to describe each part of the equation. The pressure as a function of depth equals four hundred thirty-four thousandths times depth plus fourteen and six hundred ninety-six thousandths.

### Analysis

The initial value, **14.696**, is the pressure in PSI on the diver at a depth of **0** feet, which is the surface of the water. The rate of change, or slope, is **0.434** PSI per foot. This tells us that the pressure on the diver increases **0.434** PSI for each foot her depth increases.

## Modelling Real-World Problems with Linear Functions

In the real world, problems are not always explicitly stated in terms of a function or represented with a graph. Fortunately, we can analyze the problem by first representing it as a linear function and then interpreting the components of the function. As long as we know, or can figure out, the initial value and the rate of change of a **linear function**, we can solve many different kinds of real-world problems.

## HOW TO

Given a linear function  $f$  and the initial value and rate of change, evaluate  $f$ .

1. Determine the initial value and the rate of change (slope).
2. Substitute the values into  $f(x) = mx + b$ .
3. Evaluate the function at  $x = c$ .

### Example 3.12.2

#### Using a Linear Function to Determine the Number of Songs in a Music Collection

Marcus currently has **200** songs in his music collection. Every month, he adds **15** new songs. Write a formula for the number of songs,  $N$  in his collection as a function of time,  $t$  the number of months. How many songs will he own at the end of one year?

#### Solution

The initial value for this function is **200** because he currently owns **200** songs, so  $N(0) = 200$ , which means that  $b = 200$ .

The number of songs increases by **15** songs per month, so the rate of change is **15** songs per month. Therefore we know that  $m = 15$ . We can substitute the initial value and the rate of change into the slope-intercept form of a line.

This image shows the equation  $f$  of  $x$  equals  $m$  times  $x$  plus  $b$ . It shows that  $m$  is the value 15 and  $b$  is 200. It then shows the equation rewritten as  $N$  of  $t$  equals 15 times  $t$  plus 200.

Figure 3.12.5

We can write the formula  $N(t) = 15t + 200$ .

With this formula, we can then predict how many songs Marcus will have at the end of one year (12 months). In other words, we can evaluate the function at,  $t = 12$ .

$$N(12) = 15(12) + 200$$

$$= 180 + 200$$

$$= 380$$

Marcus will have **380** songs in **12** months.

### Analysis

Notice that  $N$  is an **increasing linear function**. As the input (the number of months) increases, the output (number of songs) increases as well.

## Example 3.12.3

### Using a Linear Function to Calculate Salary Based on Commission

Working as an insurance salesperson, Ilya earns a base salary plus a commission on each new policy. Therefore, Ilya's weekly income depends on the number of new policies,  $n$  he sells during the week. Last week he sold **3** new policies, and earned **\$760** for the week. The week before, he sold **5** new policies and earned **\$920**. Find an equation for  $I$  and interpret the meaning of the components of the equation.

#### Solution

The given information gives us two input-output pairs: **(3, \$760)** and **(5, \$920)**. We start by finding the rate of change.

$$\begin{aligned}
 m &= \frac{\$920 - \$760}{5 - 3} \\
 &= \frac{\$160}{2 \text{ policies}} \\
 &= \$80 \text{ per policy}
 \end{aligned}$$

Keeping track of units can help us interpret this quantity. Income increased by **\$160** when the number of policies increased by **2**, so the rate of change is **\$80** per policy. Therefore, Ilya earns a commission of **\$80** for each policy sold during the week.

We can then solve for the initial value.

$$I(n) = 80n + b$$

$$760 = 80(3) + b \text{ when } n=3, I(3)=760$$

$$760 - 80(3) = b$$

$$520 = b$$

The value of ***b*** is the starting value for the function and represents Ilya's income when ***n* = 0** or when no new policies are sold. We can interpret this as Ilya's base salary for the week, which does not depend upon the number of policies sold.

We can now write the final equation.

$$I = 80n + 520$$

Our final interpretation is that Ilya's base salary is **\$520** per week and he earns an additional **\$80** commission for each policy sold.

### Example 3.12.4

#### Using Tabular Form to Write an Equation for a Linear Function

Below table relates the number of rats in a population to time, in weeks. Use the table to write a linear equation.

number of weeks, $w$	0	2	4	6
number of rats, $P(w)$	1000	1080	1160	1240

#### Solution

We can see from the table that the initial value for the number of rats is **1000**, so  $b = 1000$ .

Rather than solving for  $m$  we can tell from looking at the table that the population increases by **80** for every **2** weeks that pass. This means that the rate of change is **80** rats per **2** weeks, which can be simplified to **40** rats per week.

$$P(w) = 40w + 1000$$

If we did not notice the rate of change from the table we could still solve for the slope using any two points from the table. For example, using  $(2, 1080)$  and  $(6, 1240)$

$$m = \frac{1240 - 1080}{6 - 2}$$

$$= \frac{160}{4}$$

$$= 40$$

### Is the initial value always provided in a table of values like Example 3.12.4?

*No. Sometimes the initial value is provided in a table of values, but sometimes it is not. If you see an input of 0, then the initial value would be the corresponding output. If the initial value is not provided because there is no value of input on the table equal to 0, find the slope, substitute one coordinate pair and the slope into  $f(x) = mx + b$  and solve for  $b$ .*

### Try It

1) A new plant food was introduced to a young tree to test its effect on the height of the tree. The table shows the height of the tree, in feet,  $x$  months since the measurements began. Write a linear function,  $H(x)$ , where  $x$  is the number of months since the start of the experiment.

$x$	0	2	4	8	12
$H(x)$	12.5	13.5	14.5	16.5	18.5

#### Solution

$$H(x) = 0.5x + 12.5$$

## Building Linear Models from Verbal Descriptions

When building linear models to solve problems involving quantities with a constant rate of change, we typically follow the same problem strategies that we would use for any type of function. Let's briefly review them:

1. Identify changing quantities, and then define descriptive variables to represent those quantities. When appropriate, sketch a picture or define a coordinate system.
2. Carefully read the problem to identify important information. Look for information that provides values for the variables or values for parts of the functional model, such as slope and initial value.
3. Carefully read the problem to determine what we are trying to find, identify, solve, or interpret.
4. Identify a solution pathway from the provided information to what we are trying to find. Often this will involve checking and tracking units, building a table, or even finding a formula for the function being used to model the problem.
5. When needed, write a formula for the function.
6. Solve or evaluate the function using the formula.
7. Reflect on whether your answer is reasonable for the given situation and whether it makes sense mathematically.
8. Clearly convey your result using appropriate units, and answer in full sentences when necessary.

Now let's take a look at the student in Seattle. In her situation, there are two changing quantities: time and money. The amount of money she has remaining while on vacation depends on how long she stays. We can use this information to define our variables, including units.

**Output:**  $M$ , money remaining in dollars.

**Input:**  $t$ , time in weeks.

So, the amount of money remaining depends on the number of weeks:  $M(t)$ .

We can also identify the initial value and the rate of change.

**Initial Value:** She saved \$3,500, so \$3,500 is the initial value for  $M$ .

**Rate of Change:** She anticipates spending \$400 each week, so \$400 per week is the rate of change, or slope.

Notice that the unit of dollars per week matches the unit of our output variable divided by our input variable. Also, because the slope is negative, the linear function is decreasing. This should make sense because she is spending money each week.

The rate of change is constant, so we can start with the linear model  $M(t) = mt + b$ . Then we can substitute the intercept and slope provided.

$$M(t)=mt+b; m \text{ is } -400 \text{ } b \text{ is } 3500 \text{ so the equation is } M(t)=-400t+3500$$

Figure 3.12.6

To find the  $x$ -intercept, we set the output to zero, and solve for the input.

$$0 = -400t + 3500$$

$$t = \frac{3500}{400}$$

$$= 8.75$$

The  $x$ -intercept is 8.75 weeks. Because this represents the input value when the output will be zero, we could say that Emily will have no money left after 8.75 weeks.

When modelling any real-life scenario with functions, there is typically a limited domain over which that model will be valid—almost no trend continues indefinitely. Here the domain refers to the number of weeks. In this case, it doesn't make sense to talk about input values less than zero. A negative input value could refer to a number of weeks before she saved \$3,500, but the scenario discussed poses the question once she saved \$3,500 because this is when her trip and subsequent spending starts. It is also likely that this model is not valid after the  $x$ -intercept, unless Emily uses a credit card and goes into debt. The domain represents the set of input values, so the reasonable domain for this function is  $0 \leq t \leq 8.75$

In this example, we were given a written description of the situation. We followed the steps of modelling a problem to analyze the information. However, the information provided may not always be the same. Sometimes we might be provided with an intercept. Other times we might be provided with an output value. We must be careful to analyze the information we are given, and use it appropriately to build a linear model.

## Using a Given Intercept to Build a Model

Some real-world problems provide the  $y$ -intercept, which is the constant or initial value. Once the  $y$ -intercept is known, the  $x$ -intercept can be calculated. Suppose, for example, that Hannah plans to pay off a no-interest loan from her parents. Her loan balance is \$1,000. She plans to pay \$250 per month until her balance is \$0. The  $y$ -intercept is the initial amount of her debt, or \$1,000. The rate of change, or slope, is  $-\$250$  per month. We can then use the slope-intercept form and the given information to develop a linear model.

$$f(x) = mx + b$$

$$= -250x + 1000$$

Now we can set the function equal to 0, and solve for  $x$  to find the  $x$ -intercept.

$$0 = -250x + 1000$$

$$1000 = 250x$$

$$4 = x$$

$$x = 4$$

The  $x$ -intercept is the number of months it takes her to reach a balance of \$0. The  $x$ -intercept is 4 months, so it will take Hannah four months to pay off her loan.

## Using a Given Input and Output to Build a Model

Many real-world applications are not as direct as the ones we just considered. Instead they require us to identify some aspect of a linear function. We might sometimes instead be asked to evaluate the linear model at a given input or set the equation of the linear model equal to a specified output.

### HOW TO

**Given a word problem that includes two pairs of input and output values, use the linear function to solve a problem.**

1. Identify the input and output values.
2. Convert the data to two coordinate pairs.
3. Find the slope.
4. Write the linear model.
5. Use the model to make a prediction by evaluating the function at a given  $x$ -value.
6. Use the model to identify an  $x$ -value that results in a given  $y$ -value.
7. Answer the question posed.

## Example 3.12.5

### Using a Linear Model to Investigate a Town's Population

A town's population has been growing linearly. In 2004, the population was 6,200. By 2009, the population had grown to 8,100. Assume this trend continues.

- Predict the population in 2013.
- Identify the year in which the population will reach 15,000.

#### Solution

The two changing quantities are the population size and time. While we could use the actual year value as the input quantity, doing so tends to lead to very cumbersome equations because the  $y$ -intercept would correspond to the year 0, more than 2000 years ago!

To make computation a little nicer, we will define our input as the number of years since 2004.

Input:  $t$ , years since 2004

Output:  $P(t)$ , the town's population

To predict the population in 2013  $t = 9$ , we would first need an equation for the population. Likewise, to find when the population would reach 15,000, we would need to solve for the input that would provide an output of 15,000. To write an equation, we need the initial value and the rate of change, or slope.

To determine the rate of change, we will use the change in output per change in input.

$$m = \frac{\text{change in output}}{\text{change in input}}$$

The problem gives us two input-output pairs. Converting them to match our defined variables, the year 2004 would correspond to  $t = 0$  giving the point  $(0, 6200)$ . Notice that through our clever choice of variable definition, we have “given” ourselves the  $y$ -intercept of the function. The year 2009 would correspond to,  $t = 5$  giving the point  $(5, 8100)$ .

The two coordinate pairs are  $(0, 6200)$  and  $(5, 8100)$ . Recall that we encountered examples in which we were provided two points earlier in the chapter. We can use these values to calculate the slope.

$$m = \frac{8100 - 6200}{5 - 0}$$

$$= \frac{1900}{5}$$

$$= 380$$

We already know the  $y$ -intercept of the line, so we can immediately write the equation:

$$P(t) = 380t + 6200$$

To predict the population in 2013, we evaluate our function at,  $t = 9$ .

$$P(9) = 380(9) + 6,200$$

$$= 9,620$$

if the trend continues, our model predicts a population of 9,620 in 2013.

To find when the population will reach 15,000, we can set

$$P(t) = 15000$$

$$15000 = 380t + 6200$$

$$8800 = 380t$$

$$\approx 23.158$$

Our model predicts the population will reach 15,000 in a little more than 23 years after 2004, or somewhere around the year 2027.

## Try It

2) A company sells doughnuts. They incur a fixed cost of \$25,000 for rent, insurance, and other expenses. It costs \$0.25 to produce each doughnut.

- Write a linear model to represent the cost  $C$  of the company as a function of  $x$ , the number of doughnuts produced.
- Find and interpret the  $y$ -intercept.

### Solution

- $C(x) = 0.25x + 25,000$
- The  $y$ -intercept is  $(0, 25,000)$ . If the company does not produce a single doughnut, they still incur a cost of 25,000.

3) A city's population has been growing linearly. In 2008, the population was 28,200. By 2012, the population was 36,800. Assume this trend continues.

- Predict the population in 2014.
- Identify the year in which the population will reach 54,000.

### Solution

- 41,100
- 2020

## Key Concepts

- Linear functions can be represented in words, function notation, tabular form, and graphical form.
- The equation for a linear function can be written if the slope  $m$  and initial value  $b$  are known.

- A linear function can be used to solve real-world problems given information in different forms.
- We can use the same problem strategies that we would use for any type of function.
- When modelling and solving a problem, identify the variables and look for key values, including the slope and **y**-intercept.
- Draw a diagram, where appropriate.
- Check for reasonableness of the answer.
- Linear models may be built by identifying or calculating the slope and using the **y**-intercept.
  - The **x**-intercept may be found by setting,  $y = 0$ , which is setting the expression  $mx + b$  equal to 0.
  - The point of intersection of a system of linear equations is the point where the **x**- and **y**-values are the same.
  - A graph of the system may be used to identify the points where one line falls below (or above) the other line.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

An interactive H5P element has been excluded from this version of the text. You can view it online here:

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=5804#h5p-44>

Overall, after looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

## Glossary

**decreasing linear function**

a function with a negative slope: If  $f(x) = mx + b$ ,  $m < 0$ .

**increasing linear function**

a function with a positive slope: If  $f(x) = mx + b$ ,  $m > 0$ .

**linear function**

a function with a constant rate of change that is a polynomial of degree 1, and whose graph is a straight line

## 4.0 INTRODUCTION

---

Designing the number and sizes of windows in a home can pose challenges for an architect.

Figure 4.0.1: The number of windows designed by an architect can be challenging. [Photo by Mike Kononov](#)  
[Unsplash License](#)

An architect designing a home may have restrictions on both the area and perimeter of the windows because of energy and structural concerns. The length and width chosen for each window would have to satisfy two equations: one for the area and the other for the perimeter. Similarly, a banker may have a fixed amount of money to put into two investment funds. A restaurant owner may want to increase profits, but in order to do that, he will need to hire more staff. A job applicant may compare salary and costs of commuting for two job offers.

In this chapter, we will look at methods to solve situations like these using equations with two variables.

## 4.1 SOLVE SYSTEMS OF EQUATIONS BY GRAPHING

---

### Learning Objectives

By the end of this section, you will be able to:

- Determine whether an ordered pair is a solution of a system of equations
- Solve a system of linear equations by graphing
- Determine the number of solutions of linear system
- Solve applications of systems of equations by graphing

### Try It

Before you get started, take this readiness quiz:

- 1) For the equation  $y = \frac{2}{3}x - 4$ 
  - a. is  $(6, 0)$  a solution? b. is  $(-3, -2)$  a solution?
- 2) Find the slope and  $y$ -intercept of the line  $3x - y = 12$ .
- 3) Find the  $x$ - and  $y$ -intercepts of the line  $2x - 3y = 12$ .

## Determine Whether an Ordered Pair is a Solution of a System of Equations

In [Solving Linear Equations and Applications of Linear Functions](#) we learned how to solve linear equations with one variable. Remember that the solution of an equation is a value of the variable that makes a true statement when substituted into the equation.

Now we will work with systems of linear equations, two or more linear equations grouped together.

### System of Linear Equations

When two or more linear equations are grouped together, they form a **system of linear equations**.

We will focus our work here on systems of two linear equations in two unknowns. Later, you may solve larger systems of equations.

An example of a system of two linear equations is shown below. We use a brace to show the two equations are grouped together to form a system of equations.

$$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$$

A linear equation in two variables, like  $2x + y = 7$ , has an infinite number of solutions. Its graph is a line. Remember, every point on the line is a solution to the equation and every solution to the equation is a point on the line.

To solve a system of two linear equations, we want to find the values of the variables that are solutions to both equations. In other words, we are looking for the ordered pairs  $(x, y)$  that make both equations true. These are called the solutions to a system of equations.

### Solutions of a System of Equations

**Solutions of a system of equations** are the values of the variables that make all the

equations true. A solution of a system of two linear equations is represented by an ordered pair  $(x, y)$ .

To determine if an ordered pair is a solution to a system of two equations, we substitute the values of the variables into each equation. If the ordered pair makes both equations true, it is a solution to the system.

Let's consider the system below:

$$\begin{cases} 3x - y = 7 \\ x - 2y = 4 \end{cases}$$

Is the ordered pair  $(2, -1)$  a solution?

We substitute  $x = 2$  into both equations.

$$\begin{aligned} 3x - y &= 7 \\ 3(2) - (-1) &\stackrel{?}{=} 7 \\ 7 &= 7 \checkmark \end{aligned}$$

$$\begin{aligned} x - 2y &= 4 \\ 2 - 2(-1) &\stackrel{?}{=} 4 \\ 4 &= 4 \checkmark \end{aligned}$$

The ordered pair  $(2, -1)$  made both equations true. Therefore  $(2, -1)$  is a solution to this system.

Let's try another ordered pair. Is the ordered pair  $(3, 2)$  a solution?

We substitute  $x = 3$  into both equations.

$$\begin{aligned} 3x - y &= 7 \\ 3(3) - 2 &\stackrel{?}{=} 7 \\ 7 &= 7 \checkmark \end{aligned}$$

$$\begin{aligned} x - 2y &\stackrel{?}{=} 4 \\ 3 - 2(2) &= 4 \\ -2 &= 4 \text{ False} \end{aligned}$$

The ordered pair  $(3, 2)$  made one equation true, but it made the other equation false. Since it is not a solution to **both** equations, it is not a solution to this system.

### Example 4.1.1

Determine whether the ordered pair is a solution to the system:  $\begin{cases} x - y = -1 \\ 2x - y = -5 \end{cases}$

a.  $(-2, -1)$  b.  $(-4, -3)$

#### Solution

a.

$$\begin{cases} x - y = -1 \\ 2x - y = -5 \end{cases}$$

We substitute  $x = -2$  and  $y = -1$  into both equations.

$$\begin{aligned} x - y &= -1 \\ -2 - (-1) &\stackrel{?}{=} -1 \\ -1 &= -1 \checkmark \end{aligned}$$

$$\begin{aligned} 2x - y &= -5 \\ 2(-2) - (-1) &\stackrel{?}{=} -5 \\ 5 &\neq -5 \end{aligned}$$

$(-2, -1)$  does not make both equations true.  $(-2, -1)$  is not a solution.

b.

We substitute  $x = -4$  and  $y = -3$  into both equations.

$$\begin{aligned}
 x - y &= -1 \\
 -4 - (-3) &\stackrel{?}{=} -1 \\
 -1 &= -1 \checkmark
 \end{aligned}$$

$$\begin{aligned}
 2x - y &= -5 \\
 2(-4) - (-3) &\stackrel{?}{=} -5 \\
 -5 &= -5 \checkmark
 \end{aligned}$$

$(-4, -3)$  does make both equations true.  $(-4, -3)$  is a solution.

## Try It

4) Determine whether the ordered pair is a solution to the system:  $\begin{cases} 3x + y = 0 \\ x + 2y = -5 \end{cases}$

a.  $(1, -3)$  b.  $(0, 0)$

### Solution

a. yes b. no

5) Determine whether the ordered pair is a solution to the system:  $\begin{cases} x - 3y = -8 \\ -3x - y = 4 \end{cases}$

a.  $(2, -2)$  b.  $(-2, 2)$

### Solution

a. no b. yes

## Solve a System of Linear Equations by Graphing

In this chapter we will use three methods to solve a system of linear equations. The first method we'll use is graphing.

The graph of a linear equation is a line. Each point on the line is a solution to the equation. For a system of two equations, we will graph two lines. Then we can see all the points that are solutions to each equation. And, by finding what the lines have in common, we'll find the solution to the system.

Most linear equations in one variable have one solution, but we saw that some equations, called contradictions, have no solutions and for other equations, called identities, all numbers are solutions.

Similarly, when we solve a system of two linear equations represented by a graph of two lines in the same plane, there are three possible cases, as shown in Figure 4.1.1:

**The lines intersect.**

Intersecting lines have one point in common. There is one solution to this system.

**The lines are parallel.**

Parallel lines have no points in common. There is no solution to this system.

**Both equations give the same line.**

Because we have just one line, there are infinitely many solutions.

Figure 4.1.1

For the first example of solving a system of linear equations in this section and in the next two sections, we will solve the same system of two linear equations. But we'll use a different method in each section. After seeing the third method, you'll decide which method was the most convenient way to solve this system.

### Example 4.1.2

Solve the system by graphing:  $\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$

#### **Solution**

**Step 1: Graph the first equation.**

To graph the first line, write the equation in slope-intercept form.

$$2x + y = 7$$

$$y = -2x + 7$$

$$m = -2$$

$$b = 7$$

Figure 4.1.2

**Step 2: Graph the second equation on the same rectangular coordinate system.**

To graph the second line, use intercepts.

$$x - 2y = 6$$

$$(0, -3) \quad (6, 0)$$

Figure 4.1.3

**Step 3: Determine whether the lines intersect, are parallel, or are the same line.**

Look at the graph of the lines.

The lines intersect.

**Step 4: Identify the solution to the system.**

If the lines intersect, identify the point of intersection. Check to make sure it is a solution to both equations. This is the solution to the system.

If the lines are parallel, the system has no solution. If the lines are the same, the system has an infinite number of solutions.

Since the lines intersect, find the point of intersection.

Check the point in both equations.

The lines intersect at  $(4, -1)$

$$\begin{aligned}
 2x + y &= 7 \\
 2(4) + (-1) &\stackrel{?}{=} 7 \\
 8 - 1 &\stackrel{?}{=} 7 \\
 7 &= 7 \checkmark
 \end{aligned}$$

$$\begin{aligned}
 x - 2y &= 6 \\
 4 - 2(-1) &\stackrel{?}{=} 6 \\
 6 &= 6 \checkmark
 \end{aligned}$$

The solution is  $(4, -1)$ .

## Try It

6) Solve each system by graphing:  $\begin{cases} x - 3y = -3 \\ x + y = 5 \end{cases}$

**Solution**

$(3, 2)$

7) Solve each system by graphing:  $\begin{cases} -x + y = 1 \\ 3x + 2y = 12 \end{cases}$

**Solution**

$(2, 3)$

The steps to use to solve a system of linear equations by graphing are shown below.

## HOW TO

### Solve a system of linear equations by graphing.

1. Graph the first equation.
2. Graph the second equation on the same rectangular coordinate system.
3. Determine whether the lines intersect, are parallel, or are the same line.
4. Identify the solution to the system.
  - **If the lines intersect**, identify the point of intersection. Check to make sure it is a solution to both equations. This is the solution to the system.
  - **If the lines are parallel**, the system has no solution.
  - **If the lines are the same**, the system has an infinite number of solutions.

### Example 4.1.3

Solve the system by graphing:  $\begin{cases} y = 2x + 1 \\ y = 4x - 1 \end{cases}$

#### Solution

Both of the equations in this system are in slope-intercept form, so we will use their slopes

and  $y$ -intercepts to graph them.  $\begin{cases} y = 2x + 1 \\ y = 4x - 1 \end{cases}$

**Step 1: Find the slope and  $y$ -intercept of the first equation.**

$$\begin{aligned} y &= 2x + 1 \\ m &= 2 \\ &= 1 \end{aligned}$$

**Step 2: Find the slope and  $y$ -intercept of the second equation.**

$$y = 4x - 1$$

$$m = 4$$

$$= -1$$

**Step 3: Graph the two lines.**

**Step 4: Determine the point of intersection.**

The lines intersect at  $(1, 3)$ .

Figure 4.1.4

**Step 5: Check the solution in both equations.**

$$y = 2x + 1$$

$$3 \stackrel{?}{=} 2 \cdot 1 + 1$$

$$3 = 3 \checkmark$$

$$y = 4x - 1$$

$$3 \stackrel{?}{=} 4 \cdot 1 - 1$$

$$3 = 3 \checkmark$$

**Step 6: Write solution as point  $(x, y)$ .**

The solution is  $(1, 3)$ .

## Try It

8) Solve each system by graphing:  $\begin{cases} y = 2x + 2 \\ y = -x - 4 \end{cases}$

**Solution**

$(-2, -2)$

9) Solve each system by graphing:  $\begin{cases} y = 3x + 3 \\ y = -x + 7 \end{cases}$

**Solution**

$(1, 6)$

Both equations in Example 4.1.3 were given in slope–intercept form. This made it easy for us to quickly graph the lines. In the next example, we’ll first re-write the equations into slope–intercept form.

## Example 4.1.4

Solve the system by graphing:  $\begin{cases} 3x + y = -1 \\ 2x + y = 0 \end{cases}$

**Solution**

We’ll solve both of these equations for  $y$  so that we can easily graph them using their slopes and  $y$

-intercepts.  $\begin{cases} 3x + y = -1 \\ 2x + y = 0 \end{cases}$

**Step 1: Solve the first equation for  $y$ .**

**Step 2: Find the slope and  $y$ -intercept.**

$$\begin{aligned}3x + y &= -1 \\ y &= -3x - 1\end{aligned}$$

$$\begin{aligned}m &= -3 \\ b &= -1\end{aligned}$$

$$\begin{aligned}2x + y &= 0 \\ y &= -2x\end{aligned}$$

$$\begin{aligned}m &= -2 \\ b &= 0\end{aligned}$$

**Step 3:** Solve the second equation for  $y$ .

**Step 4:** Find the slope and  $y$ -intercept.

**Step 5:** Graph the lines.

Figure 4.1.5

**Step 6: Determine the point of intersection.**

The lines intersect at  $(-1, 2)$ .

**Step 7: Check the solution in both equations.**

$$\begin{array}{rclcl}
 3x + y & = & -1 & & 2x + y = 0 \\
 3(-1) + 2 & \stackrel{?}{=} & -1 & & 2(-1) + 2 \stackrel{?}{=} 0 \\
 -1 & = & -1 \checkmark & & 0 = 0 \checkmark
 \end{array}$$

The solution is  $(-1, 2)$ .

**Try It**

10) Solve each system by graphing:  $\begin{cases} -x + y = 1 \\ 2x + y = 10 \end{cases}$

**Solution**

$(3, 4)$

11) Solve each system by graphing:  $\begin{cases} 2x + y = 6 \\ x + y = 1 \end{cases}$

**Solution**

$(5, -4)$

Usually when equations are given in standard form, the most convenient way to graph them is by using the intercepts. We'll do this in Example 4.1.5.

### Example 4.1.5

Solve the system by graphing:  $\begin{cases} x + y = 2 \\ x - y = 4 \end{cases}$

#### Solution

We will find the  $x$ - and  $y$ -intercepts of both equations and use them to graph the lines.

$$x + y = 2$$

**Step 1:** To find the intercepts, let  $x = 0$  and solve for  $y$ , then let  $y = 0$  and solve for  $x$ .

$$\begin{array}{rcl} x + y & = & 2 \\ 0 + y & = & 2 \\ y & = & 2 \end{array} \qquad \begin{array}{rcl} x + y & = & 2 \\ x + 0 & = & 2 \\ x & = & 2 \end{array}$$

$x$	$y$
0	2
2	0

**Step 2:** To find the intercepts, let  $x = 0$  then let  $y = 0$ .

$$\begin{array}{rcl} x - y & = & 4 \\ 0 - y & = & 4 \\ -y & = & 4 \\ y & = & -4 \end{array} \qquad \begin{array}{rcl} x - y & = & 4 \\ x - 0 & = & 4 \\ x & = & 4 \end{array}$$

$x$	$y$
0	-4
4	0

**Step 3:** Graph the line.

Figure 4.1.6

**Step 4: Determine the point of intersection.**

The lines intersect at  $(3, -1)$ .

**Step 5: Check the solution in both equations.**

$$\begin{array}{rclcl}
 x + y & = & 2 & & x - y & = & 4 \\
 3 + (-1) & \stackrel{?}{=} & 2 & & 3 - (-1) & \stackrel{?}{=} & 4 \\
 2 & = & 2\checkmark & & 4 & = & 4\checkmark
 \end{array}$$

The solution is  $(3, -1)$ .

## Try It

12) Solve each system by graphing:  $\begin{cases} x + y = 6 \\ x - y = 2 \end{cases}$

**Solution**

$(4, 2)$

13) Solve each system by graphing:  $\begin{cases} x + y = 2 \\ x - y = -8 \end{cases}$

**Solution**

$(5, -3)$

Do you remember how to graph a linear equation with just one variable? It will be either a vertical or a horizontal line.

## Example 4.1.6

Solve the system by graphing:  $\begin{cases} y = 6 \\ 2x + 3y = 12 \end{cases}$

**Solution**

$$\begin{cases} y = 6 \\ 2x + 3y = 12 \end{cases}$$

**Step 1:** We know the first equation represents a horizontal line whose  $y$ -intercept is 6.

$$y = 6$$

**Step 2:** The second equation is most conveniently graphed using intercepts.

$$2x + 3y = 12$$

**Step 3:** To find the intercepts, let  $x = 0$  and then  $y = 0$ .

$x$	$y$
0	4
6	0

**Step 4:** Graph the lines.

Figure 4.1.7

**Step 5:** Determine the point of intersection.

The lines intersect at  $(-3, 6)$ .

**Step 6:** Check the solution to both equations.

$$\begin{array}{rcl}
 y & = & 6 \\
 6 & \stackrel{?}{=} & 6\checkmark \\
 2 & = & 2
 \end{array}
 \qquad
 \begin{array}{rcl}
 2x + 3y & = & 12 \\
 2(-3) + 3(6) & \stackrel{?}{=} & 12 \\
 -6 + 18 & \stackrel{?}{=} & 12 \\
 12 & = & 12\checkmark
 \end{array}$$

The solution is  $(-3, 6)$ .

## Try It

14) Solve each system by graphing:  $\begin{cases} y = -1 \\ x + 3y = 6 \end{cases}$

**Solution**

$(9, -1)$

15) Solve each system by graphing:  $\begin{cases} x = 4 \\ 3x - 2y = 24 \end{cases}$

**Solution**

$(4, -6)$

In all the systems of linear equations so far, the lines intersected and the solution was one point. In the next two examples, we'll look at a system of equations that has no solution and at a system of equations that has an infinite number of solutions.

**Example 4.1.7**

Solve the system by graphing:  $\begin{cases} y = \frac{1}{2}x - 3 \\ x - 2y = 4 \end{cases}$

**Solution**

$$\begin{cases} y = \frac{1}{2}x - 3 \\ x - 2y = 4 \end{cases}$$

**Step 1:** To graph the first equation, we will use its slope and  $y$ -intercept.

$$\begin{aligned} y &= \frac{1}{2}x - 3 \\ m &= \frac{1}{2} \\ b &= -3 \end{aligned}$$

**Step 2:** To graph the second equation, we will use the intercepts.

$$x - 2y = 4$$

$x$	$y$
0	-2
4	0

**Step 3:** Graph the lines.

Figure 4.1.8

**Step 4: Determine the point of intersection.**

The lines are parallel.

Since no point is on both lines, there is no ordered pair that makes both equations true.

There is no solution to this system.

**Try It**

16) Solve each system by graphing:  $\begin{cases} y = -\frac{1}{4}x + 2 \\ x + 4y = -8 \end{cases}$

**Solution**

no solution

17) Solve each system by graphing:  $\begin{cases} y = 3x - 1 \\ 6x - 2y = 6 \end{cases}$

**Solution**

no solution

### Example 4.1.8

Solve the system by graphing:  $\begin{cases} y = 2x - 3 \\ -6x + 3y = -9 \end{cases}$

**Solution**

$$\begin{cases} y = 2x - 3 \\ -6x + 3y = -9 \end{cases}$$

**Step 1: Find the slope and  $y$ -intercept of the first equation.**

$$\begin{aligned} y &= 2x - 3 \\ m &= 2 \\ b &= -3 \end{aligned}$$

**Step 2: Find the intercepts of the second equation.**

$$-6x + 3y = -9$$

$x$	$y$
0	-3
$\frac{3}{2}$	0

**Step 3: Graph the lines.**

Figure 4.1.9

**Step 4: Determine the point of intersection.**

The lines are the same!

Since every point on the line makes both equations true, there are infinitely many ordered pairs that make both equations true.

There are infinitely many solutions to this system.

**Try It**

18) Solve each system by graphing:  $\begin{cases} y = -3x - 6 \\ 6x + 2y = -12 \end{cases}$

**Solution**

infinitely many solutions

19) Solve each system by graphing:  $\begin{cases} y = \frac{1}{2}x - 4 \\ 2x - 4y = 16 \end{cases}$

**Solution**

infinitely many solutions

If you write the second equation in Example 4.1.8 in slope-intercept form, you may recognize that the equations have the same slope and same  $y$ -intercept.

When we graphed the second line in the last example, we drew it right over the first line. We say the two lines are coincident. **Coincident lines** have the same slope and same  $y$ -intercept.

## Coincident Lines

Coincident lines have the same slope and same  $y$ -intercept.

## Determine the Number of Solutions of a Linear System

There will be times when we will want to know how many solutions there will be to a system of linear equations, but we might not actually have to find the solution. It will be helpful to determine this without graphing.

We have seen that two lines in the same plane must either intersect or are parallel. The systems of equations in Example 4.1.2 through Example 4.1.6 all had two intersecting lines. Each system had one solution.

A system with parallel lines, like Example 4.1.7, has no solution. What happened in Example 4.1.8? The equations have coincident lines, and so the system had infinitely many solutions.

We'll organize these results in Figure 4.2.10 below:

Figure 4.1.10

Graph	Number of solutions
2 intersecting lines	1
Parallel lines	None
Same line	Infinitely many

Parallel lines have the same slope but different  $y$ -intercepts. So, if we write both equations in a system of linear equations in slope–intercept form, we can see how many solutions there will be without graphing! Look at the system we solved in Example 4.1.7.

$$\begin{cases} y = \frac{1}{2}x - 3 \\ x - 2y = 4 \end{cases}$$

The first line is in slope–intercept form.

$$y = \frac{1}{2}x - 3$$

$$m = \frac{1}{2}, b = -3$$

If we solve the second equation for  $y$ , we get

$$\begin{aligned} x - 2y &= 4 \\ -2y &= -x + 4 \\ y &= \frac{1}{2}x - 2 \\ m &= \frac{1}{2}, b = -2 \end{aligned}$$

The two lines have the same slope but different  $y$ -intercepts. They are parallel lines.

Figure 4.1.11 shows how to determine the number of solutions of a linear system by looking at the slopes and intercepts.

### Number of Solutions of a Linear System of Equations

Figure 4.1.11

Slopes	Intercepts	Type of Lines	Number of Solutions
Different		Intersecting	1 point
Same	Different	Parallel	No solution
Same	Same	Coincident	Infinitely many solutions

Let's take one more look at our equations in Example 4.1.7 that gave us parallel lines.

$$\begin{cases} y = \frac{1}{2}x - 3 \\ x - 2y = 4 \end{cases}$$

When both lines were in slope-intercept form we had:

$$y = \frac{1}{2}x - 3 \quad y = \frac{1}{2}x - 2$$

Do you recognize that it is impossible to have a single ordered pair  $(x, y)$  that is a solution to both of those equations?

We call a system of equations like this an **inconsistent system**. It has no solution.

A system of equations that has at least one solution is called a **consistent system**.

## Consistent and Inconsistent Systems

A consistent system of equations is a system of equations with at least one solution.

An inconsistent system of equations is a system of equations with no solution.

We also categorize the equations in a system of equations by calling the equations *independent* or *dependent*. If two equations are **independent equations**, they each have their own set of solutions. Intersecting lines and parallel lines are independent.

If two equations are dependent, all the solutions of one equation are also solutions of the other equation. When we graph two **dependent equations**, we get coincident lines.

## Independent and Dependent Equations

Two equations are independent if they have different solutions.

Two equations are dependent if all the solutions of one equation are also solutions of the other equation.

Let's sum this up by looking at the graphs of the three types of systems. See Figure 4.1.12 and Figure 4.2.13.

Figure 4.1.12

Figure 4.1.13

Lines	Intersecting	Parallel	Coincident
Number of solutions	1 point	No solution	Infinitely many
Consistent/Inconsistent	Consistent	Inconsistent	Consistent
Dependent/Independent	Independent	Independent	Dependent

### Example 4.1.9

Without graphing, determine the number of solutions and then classify the system of equations:

$$\begin{cases} y = 3x - 1 \\ 6x - 2y = 12 \end{cases}$$

#### Solution

**Step 1:** We will compare the slopes and intercepts of the two lines.

$$\begin{cases} y = 3x - 1 \\ 6x - 2y = 12 \end{cases}$$

**Step 2:** The first equation is already in slope-intercept form.

$$y = 3x - 1$$

**Step 3: Write the second equation in slope-intercept form.**

$$\begin{aligned} 6x - 2y &= 12 \\ -2y &= -6x + 12 \\ \frac{-2y}{-2} &= \frac{-6x + 12}{-2} \\ y &= 3x - 6 \end{aligned}$$

**Step 4: Find the slope and intercept of each line.**

$$\begin{array}{ll} y = 3x - 1 & y = 3x - 6 \\ m = 3 & m = 3 \\ b = -1 & b = -6 \end{array}$$

Since the slopes are the same and  $y$ -intercepts are different, the lines are parallel.

A system of equations whose graphs are parallel lines has no solution and is inconsistent and independent.

## Try It

20) Without graphing, determine the number of solutions and then classify the system of equations.

$$\begin{cases} y = -2x - 4 \\ 4x + 2y = 9 \end{cases}$$

### Solution

no solution, inconsistent, independent

21) Without graphing, determine the number of solutions and then classify the system of equations.

$$\begin{cases} y = \frac{1}{3}x - 5 \\ x - 3y = 6 \end{cases}$$

**Solution**

no solution, inconsistent, independent

**Example 4.1.10**

Without graphing, determine the number of solutions and then classify the system of equations:

$$\begin{cases} 2x + y = -3 \\ x - 5y = 5 \end{cases}$$

**Solution**

**Step 1:** We will compare the slope and intercepts of the two lines.

$$\begin{cases} 2x + y = -3 \\ x - 5y = 5 \end{cases}$$

**Step 2:** Write both equations in slope-intercept form.

$$\begin{aligned} 2x + y &= -3 \\ y &= -2x - 3 \\ x - 5y &= 5 \\ -5y &= -x + 5 \\ \frac{-5y}{-5} &= \frac{-x+5}{-5} \\ y &= \frac{1}{5}x - 1 \end{aligned}$$

**Step 3:** Find the slope and intercept of each line.

$$\begin{aligned}
 y &= -2x - 3 \\
 m &= -2 \\
 b &= -3 \\
 y &= \frac{1}{5}x - 1 \\
 m &= \frac{1}{5} \\
 b &= -1
 \end{aligned}$$

Since the slopes are different, the lines intersect.

A system of equations whose graphs intersect has 1 solution and is consistent and independent.

## Try It

22) Without graphing, determine the number of solutions and then classify the system of equations.

$$\begin{cases} 3x + 2y = 2 \\ 2x + y = 1 \end{cases}$$

### Solution

one solution, consistent, independent

23) Without graphing, determine the number of solutions and then classify the system of equations.

$$\begin{cases} x + 4y = 12 \\ -x + y = 3 \end{cases}$$

### Solution

one solution, consistent, independent

**Example 4.1.11**

Without graphing, determine the number of solutions and then classify the system of equations.

$$\begin{cases} 3x - 2y = 4 \\ y = \frac{3}{2}x - 2 \end{cases}$$

**Solution**

**Step 1:** We will compare the slopes and intercepts of the two lines.

$$\begin{cases} 3x - 2y = 4 \\ y = \frac{3}{2}x - 2 \end{cases}$$

**Step 2:** Write the first equation in slope-intercept form.

$$\begin{aligned} 3x - 2y &= 4 \\ -2y &= -3x + 4 \\ \frac{-2y}{-2} &= \frac{-3x + 4}{-2} \\ y &= \frac{3}{2}x - 2 \end{aligned}$$

**Step 3:** The second equation is already in slope-intercept form.

$$y = \frac{3}{2}x - 2$$

Since the slopes are the same, they have the same slope and same  $y$ -intercept and so the lines are coincident.

A system of equations whose graphs are coincident lines has infinitely many solutions and is consistent and dependent.

## Try It

24) Without graphing, determine the number of solutions and then classify the system of equations.

$$\begin{cases} 4x - 5y = 20 \\ y = \frac{4}{5}x - 4 \end{cases}$$

**Solution**

infinitely many solutions, consistent, dependent

25) Without graphing, determine the number of solutions and then classify the system of equations.

$$\begin{cases} -2x - 4y = 8 \\ y = -\frac{1}{2}x - 2 \end{cases}$$

**Solution**

infinitely many solutions, consistent, dependent

## Solve Applications of Systems of Equations by Graphing

We will use the same problem solving strategy we used in Math Models to set up and solve applications of systems of linear equations. We'll modify the strategy slightly here to make it appropriate for systems of equations.

## HOW TO

### Use a problem solving strategy for systems of linear equations.

1. Read the problem. Make sure all the words and ideas are understood.
2. Identify what we are looking for.
3. Name what we are looking for. Choose variables to represent those quantities.
4. Translate into a system of equations.
5. Solve the system of equations using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

Step 5 is where we will use the method introduced in this section. We will graph the equations and find the solution.

### Example 4.1.12

Sondra is making **10** quarts of punch from fruit juice and club soda. The number of quarts of fruit juice is **4** times the number of quarts of club soda. How many quarts of fruit juice and how many quarts of club soda does Sondra need?

#### **Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

We are looking for the number of quarts of fruit juice and the number of quarts of club soda that Sondra will need.

**Step 3: Name what we are looking for. Choose variables to represent those quantities.**

Let  $f$  = number of quarts of fruit juice.

Let  $c$  = number of quarts of club soda

**Step 4: Translate into a system of equations.**

The number of quarts of fruit juice  $\underbrace{\hspace{2cm}}_f$  and the number of quarts of club soda  $\underbrace{\hspace{2cm}}_c$  is 10  $\underbrace{\hspace{1cm}}_{=10}$

The number of quarts of fruit juice  $\underbrace{\hspace{2cm}}_f$  is  $\underbrace{\hspace{1cm}}_{=}$  four times the number of quarts of club soda  $\underbrace{\hspace{2cm}}_{4c}$

We now have the system.  $\begin{cases} f + c = 10 \\ f = 4c \end{cases}$

**Step 5: Solve the system of equations using good algebra techniques.**

Figure 4.1.14

The point of intersection  $(2, 8)$  is the solution. This means Sondra needs **2** quarts of club soda and **8** quarts of fruit juice.

**Step 6: Check the answer in the problem and make sure it makes sense.**

Does this make sense in the problem?

Yes, the number of quarts of fruit juice, **8** is **4** times the number of quarts of club soda, **2**.

Yes, **10** quarts of punch is **8** quarts of fruit juice plus **2** quarts of club soda.

**Step 7: Answer the question with a complete sentence.**

Sondra needs **8** quarts of fruit juice and **2** quarts of soda.

## Try It

26) Manny is making **12** quarts of orange juice from concentrate and water. The number of quarts of water is **3** times the number of quarts of concentrate. How many quarts of concentrate and how many quarts of water does Manny need?

### **Solution**

Manny needs **3** quarts juice concentrate and **9** quarts water.

27) Alisha is making an **18** ounce coffee beverage that is made from brewed coffee and milk. The number of ounces of brewed coffee is **5** times greater than the number of ounces of milk. How many ounces of coffee and how many ounces of milk does Alisha need?

### **Solution**

Alisha needs **15** ounces of coffee and **3** ounces of milk.

# Key Concepts

- **To solve a system of linear equations by graphing**
  1. Graph the first equation.
  2. Graph the second equation on the same rectangular coordinate system.
  3. Determine whether the lines intersect, are parallel, or are the same line.
  4. Identify the solution to the system.
    - If the lines intersect**, identify the point of intersection. Check to make sure it is a solution to both equations. This is the solution to the system.
    - If the lines are parallel**, the system has no solution.
    - If the lines are the same**, the system has an infinite number of solutions.
  5. Check the solution in both equations.
- Determine the number of solutions from the graph of a linear system

Graph	Number of solutions
2 intersecting lines	1
Parallel lines	None
Same line	Infinitely many

- Determine the number of solutions of a linear system by looking at the slopes and intercepts

**Number of Solutions of a Linear System of Equations**

Slopes	Intercepts	Type of Lines	Number of Solutions
Different		Intersecting	1 point
Same	Different	Parallel	No solution
Same	Same	Coincident	Infinitely many solutions

- Determine the number of solutions and how to classify a system of equations

Lines	Intersecting	Parallel	Coincident
Number of solutions	1 point	No solution	Infinitely many
Consistent/Inconsistent	Consistent	Inconsistent	Consistent
Dependent/Independent	Independent	Independent	Dependent

• **Problem Solving Strategy for Systems of Linear Equations**

1. Read the problem. Make sure all the words and ideas are understood.
2. Identify what we are looking for.
3. Name what we are looking for. Choose variables to represent those quantities.
4. Translate into a system of equations.
5. Solve the system of equations using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=2205#h5p-9>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## Glossary

### coincident lines

Coincident lines are lines that have the same slope and same  $y$ -intercept.

### consistent system

A consistent system of equations is a system of equations with at least one solution.

### dependent equations

Two equations are dependent if all the solutions of one equation are also solutions of the other equation.

### inconsistent system

An inconsistent system of equations is a system of equations with no solution.

### independent equations

Two equations are independent if they have different solutions.

### solutions of a system of equations

Solutions of a system of equations are the values of the variables that make all the equations true. A solution of a system of two linear equations is represented by an ordered pair  $(x, y)$ .

**system of linear equations**

When two or more linear equations are grouped together, they form a system of linear equations.

## 4.2 SOLVE SYSTEMS OF EQUATIONS BY SUBSTITUTION

---

### Learning Objectives

By the end of this section, you will be able to:

- Solve a system of equations by substitution
- Solve applications of systems of equations by substitution

### Try It

Before you get started, take this readiness quiz:

- 1) Simplify  $-5(3 - x)$ .
- 2) Simplify  $4 - 2(n + 5)$ .
- 3) Solve for  $y$ :  $8y - 8 = 32 - 2y$ .
- 4) Solve for  $x$ :  $3x - 9y = -3$ .

Solving systems of linear equations by graphing is a good way to visualize the types of solutions that may result. However, there are many cases where solving a system by graphing is inconvenient or imprecise. If the graphs extend beyond the small grid with  $x$  and  $y$  both between  $-10$  and  $10$ , graphing the lines may be cumbersome. And if the solutions to the system are not integers, it can be hard to read their values precisely from a graph.

In this section, we will solve systems of linear equations by the substitution method.

## Solve a System of Equations by Substitution

We will use the same system we used first for graphing.

$$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$$

We will first solve one of the equations for either  $x$  or  $y$ . We can choose either equation and solve for either variable—but we'll try to make a choice that will keep the work easy.

Then we substitute that expression into the other equation. The result is an equation with just one variable—and we know how to solve those!

After we find the value of one variable, we will substitute that value into one of the original equations and solve for the other variable. Finally, we check our solution and make sure it makes both equations true.

We'll fill in all these steps now in Example 4.2.1

### Example 4.2.1

How to Solve a System of Equations by Substitution

Solve the system by substitution.  $\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$

#### Solution

**Step 1.** Solve one of the equations for either variable.

We'll solve the first equation for  $y$ .

$$2x + y = 7$$

$$y = 7 - 2x$$

Figure 4.2.1

<b>Step 2.</b> Substitute the expression from Step 1 into the other equation.	We replace $y$ in the second equation with the expression $7 - 2x$ .	$x - 2y = 6$ $x - 2(7 - 2x) = 6$
---	--	----------------------------------

Figure 4.2.2

<b>Step 3.</b> Solve the resulting equation.	Now we have an equation with just 1 variable. We know how to solve this!	$x - 2(7 - 2x) = 6$ $x - 14 + 4x = 6$ $5x = 20$ $x = 4$
--	--	---

Figure 4.2.3

<b>Step 4.</b> Substitute the solution in Step 3 into one of the original equations to find the other variable.	We'll use the first equation and replace $x$ with 4.	$2x + y = 7$ $2(4) + y = 7$ $8 + y = 7$ $y = -1$
---	--	--

Figure 4.2.4

<b>Step 5.</b> Write the solution as an ordered pair.	The ordered pair is $(x, y)$ .	$(4, -1)$
---	--------------------------------	-----------

Figure 4.2.5

<b>Step 6.</b> Check that the ordered pair is a solution to <b>both</b> original equations.	Substitute $(4, -1)$ into both equations and make sure they are both true.	<div style="display: flex; justify-content: space-around;"> <div style="text-align: center;"> <math display="block">2x + y = 7</math> <math display="block">2(4) + (-1) \stackrel{?}{=} 7</math> <math display="block">7 = 7 \checkmark</math> </div> <div style="text-align: center;"> <math display="block">x - 2y = 6</math> <math display="block">4 - 2(-1) \stackrel{?}{=} 6</math> <math display="block">6 = 6 \checkmark</math> </div> </div> <p>Both equations are true.  <math>(4, -1)</math> is the solution to the system.</p>
---	--	---

Figure 4.2.6

## Try It

5) Solve the system by substitution.

$$\begin{cases} -2x + y = -11 \\ x + 3y = 9 \end{cases}$$

**Solution**

$(6, 1)$

6) Solve the system by substitution.

$$\begin{cases} x + 3y = 10 \\ 4x + y = 18 \end{cases}$$

**Solution**

$(4, 2)$

## HOW TO

**Solve a system of equations by substitution.**

1. Solve one of the equations for either variable.
2. Substitute the expression from Step 1 into the other equation.
3. Solve the resulting equation.
4. Substitute the solution in Step 3 into one of the original equations to find the other variable.
5. Write the solution as an ordered pair.
6. Check that the ordered pair is a solution to **both** original equations.

If one of the equations in the system is given in slope–intercept form, Step 1 is already done! We'll see this in Example 4.2.2

### Example 4.2.2

Solve the system by substitution.

$$\begin{cases} x + y = -1 \\ y = x + 5 \end{cases}$$

#### Solution

The second equation is already solved for  $y$ . We will substitute the expression in place of  $y$  in the first equation.

The second equation is already solved for  $y$ . We will substitute into the first equation.

$$\begin{cases} x + y = -1 \\ y = x + 5 \end{cases}$$

**Step 1: Replace the  $y$  with  $x + 5$**

$$\begin{aligned} y &= x + 5 \\ x + y &= -1 \\ x + x + 5 &= -1 \end{aligned}$$

**Step 2: Solve the resulting equation for  $x$**

$$\begin{aligned} x + x + 5 &= -1 \\ 2x + 5 &= -1 \\ 2x &= -6 \end{aligned}$$

**Step 3: Substitute  $x = -3$  into  $y = x + 5$  to find  $y$**

$$\begin{aligned} x &= -3 \\ y &= x + 5 \\ y &= -3 + 5 \\ y &= 2 \end{aligned}$$

The ordered pair is  $(-3, 2)$ .

**Step 4: Check the ordered pair in both equations:**

$x + y = -1$	$y = x + 5$
$-3 + 2 \stackrel{?}{=} -1$	$2 \stackrel{?}{=} -3 + 5$
$-1 = -1 \checkmark$	$2 = 2 \checkmark$

The solution is  $(-3, 2)$ .

## Try It

7) Solve the system by substitution.

$$\begin{cases} x + y = 6 \\ y = 3x - 2 \end{cases}$$

**Solution**

$(2, 4)$

8) Solve the system by substitution.

$$\begin{cases} 2x - y = 1 \\ y = -3x - 6 \end{cases}$$

**Solution**

$(-1, -3)$

If the equations are given in standard form, we'll need to start by solving for one of the variables. In this next example, we'll solve the first equation for  $y$ .

### Example 4.2.3

Solve the system by substitution.

$$\begin{cases} 3x + y = 5 \\ 2x + 4y = -10 \end{cases}$$

#### Solution

We need to solve one equation for one variable. Then we will substitute that expression into the other equation.

Solve for  $y$

$$3x + y = 5$$

**Step 1: Substitute into the other equation.**

**Step 2: Replace the  $y$  with  $-3x + 5$ .**

$$3x + y = 5$$

$$y = -3 + 5$$

$$2x + 4y = -10$$

$$2x + 4(-3 + 5) = -10$$

**Step 3: Solve the resulting equation for  $x$ .**

$$2x - 12x + 20 = -10$$

$$-10x + 20 = -10$$

$$-10x = -30$$

$$x = 3$$

**Step 4: Substitute  $x = 3$  into  $3x + y = 5$  to find  $y$ .**

$$x = 3$$

$$3x + y = 5$$

$$3(3) + y = 5$$

$$9 + y = 5$$

$$y = -4$$

The ordered pair is  $(3, -4)$ .

**Step 5: Check the ordered pair in both equations:**

$3x + y = 5$	$2x + 4y = -10$
$-3 \times 3 + (-4) \stackrel{?}{=} 5$	$2 \times 3 + 4(-4) = -10$
$9 - 4 \stackrel{?}{=} 5$	$6 - 16 \stackrel{?}{=} -10$
$5 = 5 \checkmark$	$-10 = -10 \checkmark$

The solution is  $(3, -4)$ .

## Try It

9) Solve the system by substitution.

$$\begin{cases} 4x + y = 2 \\ 3x + 2y = -1 \end{cases}$$

**Solution**

$(1, -2)$

10) Solve the system by substitution.

$$\begin{cases} -x + y = 4 \\ 4x - y = -2 \end{cases}$$

**Solution**

$(2, 6)$

In Example 4.2.3 it was easiest to solve for  $y$  in the first equation because it had a coefficient of 1. In Example 4.2.4 it will be easier to solve for  $x$ .

### Example 4.2.4

Solve the system by substitution.

$$\begin{cases} x - 2y = -2 \\ 3x + 2y = 34 \end{cases}$$

#### Solution

We will solve the first equation for  $x$  and then substitute the expression into the second equation.

$$x - 2y = -2$$

**Step 1: Solve for  $x$ .**

**Step 2: Substitute into the other equation.**

**Step 3: Replace the  $x$  with  $2y - 2$ .**

$$\begin{aligned} 3x + 2y &= 34 \\ 3(2y - 2) + 2y &= 34 \end{aligned}$$

**Step 4: Solve the resulting equation for  $y$ .**

$$\begin{aligned} 6y - 6 + 2y &= 34 \\ 8y - 6 &= 34 \\ 8y &= 40 \\ y &= 5 \end{aligned}$$

**Step 5: Substitute  $y = 5$  into  $x - 2y = -2$  to find  $x$ .**

$$\begin{aligned} x - 2y &= -2 \\ x - 2 \times 5 &= -2 \\ x - 10 &= -2 \\ x &= 8 \end{aligned}$$

The ordered pair is  $(8, 5)$ .

**Step 6: Check the ordered pair in both equations:**

$x - 2y = -2$	$3x + 2y = 34$
$8 - 2 \times 5 \stackrel{?}{=} -2$	$3 \times 8 + 2 \times 5 \stackrel{?}{=} 34$
$8 - 10 \stackrel{?}{=} -2$	$24 + 10 \stackrel{?}{=} 34$
$-2 = -2 \checkmark$	$34 = 34 \checkmark$

The solution is  $(8, 5)$ .

## Try It

11) Solve the system by substitution.

$$\begin{cases} x - 5y = 13 \\ 4x - 3y = 1 \end{cases}$$

**Solution**

$(-2, -3)$

12) Solve the system by substitution.

$$\begin{cases} x - 6y = -6 \\ 2x - 4y = 4 \end{cases}$$

**Solution**

$(6, 2)$

When both equations are already solved for the same variable, it is easy to substitute!

### Example 4.2.5

Solve the system by substitution.

$$\begin{cases} y = -2x + 5 \\ y = \frac{1}{2}x \end{cases}$$

#### Solution

Since both equations are solved for  $y$ , we can substitute one into the other.

**Step 1: Substitute  $\frac{1}{2}x$  for  $y$  in the first equation.**

$$\begin{aligned} y &= \frac{1}{2}x \\ y &= -2x + 5 \end{aligned}$$

**Step 2: Replace the  $y$  with  $\frac{1}{2}x$**

$$\frac{1}{2}x = -2x + 5$$

**Step 3: Solve the resulting equation. Start by clearing the fraction.**

$$2\left(\frac{1}{2}x\right) = 2(-2x + 5)$$

**Step 4: Solve for  $x$ .**

$$\begin{aligned} x &= -4x + 10 \\ 5x &= 10 \\ x &= 2 \end{aligned}$$

**Step 5: Substitute  $x = 2$  into  $y = \frac{1}{2}x$  to find  $y$ .**

$$\begin{aligned}
 x &= 2 \\
 y &= \frac{1}{2}x \\
 y &= \frac{1}{2} \times 2 \\
 y &= 1
 \end{aligned}$$

The ordered pair is  $(2, 1)$ .

**Step 6: Check the ordered pair in both equations**

$y = \frac{1}{2}x$	$y = -2x + 5$
$1 \stackrel{?}{=} \frac{1}{2} \times 2$	$1 \stackrel{?}{=} -2 \times 2 + 5$
$1 = 1 \checkmark$	$1 = 1 \checkmark$

The solution is  $(2, 1)$ .

## Try It

13) Solve the system by substitution.

$$\begin{cases} x + y = 6 \\ y = 3x - 2 \end{cases}$$

**Solution**

$(6, 2)$

14) Solve the system by substitution.

$$\begin{cases} 4x - y = 0 \\ 2x - 3y = 5 \end{cases}$$

**Solution** $(8, 2)$ 

Be very careful with the signs in the next example.

**Example 4.2.6**

Solve the system by substitution.

$$\begin{cases} 4x + 2y = 4 \\ 6x - y = 8 \end{cases}$$

**Solution**

We need to solve one equation for one variable. We will solve the first equation for  $y$ .

$$4x + 2y = 4$$

**Step 1: Solve the first equation for  $y$ .**

$$2y = -4x + 4$$

**Step 2: Substitute  $-2x + 2$  for  $y$  in the second equation.**

$$\begin{aligned} y &= -2x + 2 \\ 6x - y &= 8 \end{aligned}$$

**Step 3: Replace the  $y$  with  $-2x + 2$ .**

$$6x - (-2x + 2) = 8$$

**Step 4: Solve the equation for  $x$ .**

$$\begin{aligned} 6x + 2x - 2 &= 8 \\ 8x - 2 &= 8 \\ 8x &= 10 \\ x &= \frac{5}{2} \end{aligned}$$

**Step 5: Substitute**  $x = \frac{5}{4}$  **into**  $4x + 2y = 4$  **to find**  $y$ .

$$\begin{aligned}x &= \frac{5}{4} \\4x + 2y &= 4 \\4\left(\frac{5}{4}\right) + 2y &= 4 \\5 + 2y &= 4 \\2y &= -1 \\y &= -\frac{1}{2}\end{aligned}$$

The ordered pair is  $\left(\frac{5}{4}, -\frac{1}{2}\right)$

**Step 6: Check the ordered pair in both equations.**

$\begin{aligned}4x + 2y &= 4 \\4\left(\frac{5}{4}\right) + 2\left(-\frac{1}{2}\right) &\stackrel{?}{=} 4 \\5 - 1 &\stackrel{?}{=} 4 \\4 &= 4 \checkmark\end{aligned}$	$\begin{aligned}6x - y &= 8 \\6\left(\frac{5}{4}\right) - \left(-\frac{1}{2}\right) &\stackrel{?}{=} 8 \\\frac{15}{4} - \left(-\frac{1}{2}\right) &\stackrel{?}{=} 8 \\\frac{16}{4} &\stackrel{?}{=} 8 \\4 &= 4 \checkmark\end{aligned}$
---	--

The solution is  $\left(\frac{5}{4}, -\frac{1}{2}\right)$

## Try It

15) Solve the system by substitution.

$$\begin{cases} 3x + y = 5 \\ 2x + 4y = -10 \end{cases}$$

**Solution**

$$\left(2, \frac{3}{2}\right)$$

16) Solve the system by substitution.

$$\begin{cases} 4x - y = 0 \\ 2x - 3y = 5 \end{cases}$$

**Solution**

$$\left(-\frac{1}{2}, -2\right)$$

In Example 4.2.7, it will take a little more work to solve one equation for  $x$  or  $y$ .

## Example 4.2.7

Solve the system by substitution.

$$\begin{cases} 4x - 3y = 6 \\ 15y - 20x = -30 \end{cases}$$

**Solution**

We need to solve one equation for one variable. We will solve the first equation for  $x$ .

$$x = \frac{5}{2}$$

$$4x - 3y = 6$$

**Step 1: Solve the first equation for  $x$ .**

$$4x = 3y + 6$$

**Step 2: Substitute  $\frac{3}{4}y + \frac{3}{2}$  for  $x$  in the second equation.**

$$x = \frac{3}{4}y + \frac{3}{2}$$

$$15y - 20x = -30$$

**Step 3: Replace the  $x$  with  $\frac{3}{4}y + \frac{3}{2}$**

$$15y - 20\left(\frac{3}{4}y + \frac{3}{2}\right) = -30$$

**Step 4: Solve for  $y$ .**

$$15y - 15y - 30 = -30$$

$$0 - 30 = -30$$

$$0 = 0$$

Since  $0 = 0$  is a true statement, the system is consistent. The equations are dependent. The graphs of these two equations would give the same line. The system has infinitely many solutions.

## Try It

17) Solve the system by substitution.

$$\begin{cases} 2x - 3y = 12 \\ -12y + 8x = 48 \end{cases}$$

**Solution**

Infinitely many solutions.

18) Solve the system by substitution.

$$\begin{cases} 5x + 2y = 12 \\ -4y - 10x = -24 \end{cases}$$

**Solution**

Infinitely many solutions.

Look back at the equations in Example 4.2.7. Is there any way to recognize that they are the same line?

Let's see what happens in the next example.

**Example 4.2.8**

Solve the system by substitution.

$$\begin{cases} 5x - 2y = -10 \\ y = \frac{5}{2}x \end{cases}$$

**Solution**

The second equation is already solved for  $y$ , so we can substitute for  $y$  in the first equation.

**Step 1: Substitute  $x$  for  $y$  in the first equation.**

$$\begin{aligned} y &= \frac{5}{2}x \\ 5x - 2y &= -10 \end{aligned}$$

**Step 2: Replace the  $y$  with  $\frac{5}{2}x$ .**

$$5x - 2\left(\frac{5}{2}x\right) = -10$$

**Step 3: Solve for  $x$ .**

$$\begin{aligned} 5x - 5x &= -10 \\ 0 &\neq -10 \end{aligned}$$

Since  $0 = -10$  is a false statement the equations are inconsistent. The graphs of the two equation would be parallel lines. The system has no solutions.

## Try It

19) Solve the system by substitution.

$$\begin{cases} 3x + 2y = 9 \\ y = -\frac{3}{2}x + 1 \end{cases}$$

**Solution**

No solution.

20) Solve the system by substitution.

$$\begin{cases} 5x - 3y = 2 \\ y = \frac{5}{3}x - 4 \end{cases}$$

**Solution**

No solution.

## Solve Applications of Systems of Equations by Substitution

We'll copy here the problem solving strategy we used in the Solving Systems of Equations by Graphing section for solving systems of equations. Now that we know how to solve systems by substitution, that's what we'll do in Step 5:

How to use a problem solving strategy for systems of linear equations.

## How To:

### How to use a problem-solving strategy for systems of linear equations.

1. Read the problem. Make sure all the words and ideas are understood.
2. Identify what we are looking for.
3. Name what we are looking for. Choose variables to represent those quantities.
4. Translate into a system of equations.
5. Solve the system of equations using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

Some people find setting up word problems with two variables easier than setting them up with just one variable. Choosing the variable names is easier when all you need to do is write down two letters. Think about this in the next example—how would you have done it with just one variable?

### Example 4.2.9

The sum of two numbers is zero. One number is nine less than the other. Find the numbers.

#### **Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

We are looking for two numbers.

**Step 3: Name what we are looking for.**

Let  $n$  = the first number

Let  $m$  = the second number

**Step 4: Translate into a system of equations.**

The sum of two numbers is zero.

$$n + m = 0$$

One number is nine less than the other.

$$n = m - 9$$

The system is:

$$\begin{cases} n + m = 0 \\ n = m - 9 \end{cases}$$

**Step 5: Solve the system of equations.**

We will use substitution since the second equation is solved for  $n$ .

Substitute  $m - 9$  for  $n$  in the first equation.

$$\begin{array}{l} n = m - 9 \\ n + m = 0 \end{array}$$

Figure 4.2.7

Solve for  $m$ .

$$m - 9 + m = 0$$

$$2m - 9 = 0$$

$$2m = 9$$

Substitute  $m = \frac{9}{2}$  into the second equation and then solve for  $n$ .

$$\begin{array}{l} m = \frac{9}{2} \\ n = m - 9 \end{array}$$

Figure 4.2.8

$$m = \frac{9}{2} - 9$$

$$m = \frac{9}{2} - \frac{18}{2}$$

$$n = -\frac{9}{2}$$

**Step 6: Check the answer in the problem.**

Do these numbers make sense in the problem? We will leave this to you!

**Step 7: Answer the question.**

The numbers are  $\frac{9}{2}$  and  $-\frac{9}{2}$

## Try It

21) The sum of two numbers is **10**. One number is **4** less than the other. Find the numbers.

**Solution**

The numbers are **3** and **7**.

22) The sum of two number is **−6**. One number is **10** less than the other. Find the numbers.

**Solution**

The numbers are **2** and **−8**.

In the Example 4.2.10, we'll use the formula for the perimeter of a rectangle,  $P = 2L + 2W$ .

### Example 4.2.10

The perimeter of a rectangle is 88. The length is five more than twice the width. Find the length and the width.

#### Solution

##### Step 1: Read the problem.

Figure 4.2.9

##### Step 2: Identify what you are looking for.

We are looking for the length and width.

##### Step 3: Name what we are looking for.

Let  $L$  = the length

Let  $W$  = the width

##### Step 4: Translate into a system of equations.

The perimeter of a rectangle is 88.

$$2L + 2W = P$$

$$2L + 2W = 88$$

The length is five more than twice the width.

$$L = 2W + 5$$

The system is:

$$\begin{cases} 2L + 2W = 88 \\ L = 2W + 5 \end{cases}$$

##### Step 5: Solve the system of equations.

We will use substitution since the second equation is solved for  $L$ .

Substitute  $2W + 5$  for  $L$  in the first equation.

$$L = 2W + 5$$

$$2L + 2W = 88$$

Figure 4.2.10

Solve for  $W$ .

$$2(2W + 5) + 2W = 88$$

$$4W + 10 + 2W = 88$$

$$6W + 10 = 88$$

$$6W = 78$$

Substitute  $W = 13$  into the second equation and then solve for  $L$ .

$$W = 13$$

$$L = 2W + 5$$

Figure 4.2.11

$$L = 2 \times 13 + 5$$

$$L = 31$$

**Step 6: Check the answer in the problem.**

Does a rectangle with length **31** and width **13** have perimeter **88**? Yes.

**Step 7: Answer the equation.**

The length is **31** and the width is **13**.

## Try It

23) The perimeter of a rectangle is **40**. The length is **4** more than the width. Find the length and width of the rectangle.

**Solution**

The length is **12** and the width is **8**.

24) The perimeter of a rectangle is **58**. The length is **5** more than three times the width. Find the length and width of the rectangle.

**Solution**

The length is **23** and the width is **6**.

For Example 4.2.11, we need to remember that the sum of the measures of the angles of a triangle is **180** degrees and that a right triangle has one **90** degree angle.

## Example 4.2.11

The measure of one of the small angles of a right triangle is ten more than three times the measure of the other small angle. Find the measures of both angles.

**Solution**

We will draw and label a figure.

**Step 1: Read the problem.**

Figure 4.2.12

**Step 2: Identify what you are looking for.**

We are looking for the measures of the angles.

**Step 3: Name what we are looking for.**

Let  $a$  = the measure of the 1<sup>st</sup> angle.

Let  $b$  = the measure of the 2<sup>nd</sup> angle.

**Step 4: Translate into a system of equations.**

The measure of one of the small angles of a right triangle is ten more than three times the measure of the other small angle.

$$a = 3b + 10$$

The sum of the measures of the angles of a triangle is 180.

$$a + b + 90 = 180$$

The system is:

$$\begin{cases} a = 3b + 10 \\ a + b + 90 = 180 \end{cases}$$

**Step 5: Solve the system of equations.**

We will use substitution since the first equation is solved for  $a$ .

$$a = 3b + 10$$

$$a + b + 90 = 180$$

Figure 4.2.13

Substitute  $3b + 10$  for  $a$  in the second equation.

$$(3b + 10) + b + 90 = 180$$

Solve for  $b$ .

$$4b + 100 = 180$$

$$4b = 80$$

$$b = 20$$

$$a = 3b + 10$$

Figure 4.2.14

Substitute  $b = 20$  into the first equation and then solve for  $a$ .

$$a = 3 \times 20 + 10$$

$$a = 70$$

**Step 6: Check the answer in the problem.**

We will leave this to you!

**Step 7: Answer the question.**

The measures of the small angles are **20** and **70**.

## Try It

25) The measure of one of the small angles of a right triangle is **2** more than **3** times the measure of the other small angle. Find the measure of both angles.

**Solution**

The measure of the angles are **22** degrees and **68** degrees.

26) The measure of one of the small angles of a right triangle is **18** less than twice the measure of the other small angle. Find the measure of both angles.

**Solution**

The measure of the angles are **36** degrees and **54** degrees.

### Example 4.2.12

Heather has been offered two options for her salary as a trainer at the gym. Option A would pay her \$25,000 plus \$15 for each training session. Option B would pay her \$10,000 + \$40 for each training session. How many training sessions would make the salary options equal?

#### Solution

**Step 1: Read the problem.**

**Step 2: Identify what you are looking for.**

We are looking for the number of training sessions that would make the pay equal.

**Step 3: Name what we are looking for.**

Let  $s$  = Heather's salary.

Let  $n$  = the number of training sessions

**Step 4: Translate into a system of equations.**

Option A would pay her \$25,000 plus 15 for each training session.

$$s = 25,000 + 15n$$

Option B would pay her \$10,000 + \$40 for each training session

$$s = 10,000 + 40n$$

The system is:

$$\begin{cases} s = 25,000 + 15n \\ s = 10,000 + 40n \end{cases}$$

**Step 5: Solve the system of equations.**

We will use substitution.

$$\begin{aligned} s &= 25,000 + 15n \\ s &= 10,000 + 40n \end{aligned}$$

Figure 4.2.15

Substitute  $25,000 + 15n$  for  $s$  in the second equation.

$$25,000 + 15n = 10,000 + 40n$$

Solve for  $n$ .

$$25,000 = 10,000 + 25n$$

$$15,000 = 25n$$

$$600 = n$$

**Step 6: Check the answer.**

Are 600 training sessions a year reasonable?

Are the two options equal when  $n = 600$ ?

**Step 7: Answer the question.**

The salary options would be equal for 600 training sessions.

## Try It

27) Geraldine has been offered positions by two insurance companies. The first company pays a salary of \$12,000 plus a commission of \$100 for each policy sold. The second pays a salary of \$20,000 plus a commission of \$50 for each policy sold. How many policies would need to be sold to make the total pay the same?

**Solution**

There would need to be 160 policies sold to make the total pay the same.

28) Kenneth currently sells suits for company A at a salary of \$22,000 plus a \$10 commission for each suit sold. Company B offers him a position with a salary of \$28,000 plus a \$4 commission for each suit sold. How many suits would Kenneth need to sell for the options to be equal?

**Solution**

Kenneth would need to sell 1,000 suits.

Access these online resources for additional instruction and practice with solving systems of equations by substitution.

[Instructional Video-Solve Linear Systems by Substitution](#)

[Instructional Video-Solve by Substitution](#)

## Key Concepts

- **Solve a system of equations by substitution**

1. Solve one of the equations for either variable.
2. Substitute the expression from Step 1 into the other equation.
3. Solve the resulting equation.
4. Substitute the solution in Step 3 into one of the original equations to find the other variable.
5. Write the solution as an ordered pair.
6. Check that the ordered pair is a solution to both original equations.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=2314#h5p-10>

After reviewing this checklist, what will you do to become confident for all objectives?

## 4.3 SOLVE SYSTEMS OF EQUATIONS BY ELIMINATION

---

### Learning Objectives

By the end of this section, you will be able to:

- Solve a system of equations by elimination
- Solve applications of systems of equations by elimination
- Choose the most convenient method to solve a system of linear equations

### Try It

Before you get started, take this readiness quiz.

1) Simplify  $-5(6 - 3a)$ .

2) Solve the equation  $\frac{1}{3}x + \frac{5}{8} = \frac{31}{24}$ .

We have solved systems of linear equations by graphing and by substitution. Graphing works well when the variable coefficients are small and the solution has integer values. Substitution works well when we can easily solve one equation for one of the variables and not have too many fractions in the resulting expression.

The third method of solving systems of linear equations is called the Elimination Method. When we solved a system by substitution, we started with two equations and two variables and reduced it to one equation with one variable. This is what we'll do with the elimination method, too, but we'll have a different way to get there.

## Solve a System of Equations by Elimination

The Elimination Method is based on the Addition Property of Equality. The Addition Property of Equality says that when you add the same quantity to both sides of an equation, you still have equality. We will extend the Addition Property of Equality to say that when you add equal quantities to both sides of an equation, the results are equal.

For any expressions  $a$ ,  $b$ ,  $c$ , and  $d$ ,

$$\begin{array}{lcl} \text{if} & a & = b \\ \text{and} & c & = d \\ \text{then} & a + c & = b + d \end{array}$$

To solve a system of equations by elimination, we start with both equations in standard form. Then we decide which variable will be easiest to eliminate. How do we decide? We want to have the coefficients of one variable be opposites, so that we can add the equations together and eliminate that variable.

Notice how that works when we add these two equations together:

$$\begin{array}{rcl} 3x + y & = & 5 \\ 2x - y & = & 0 \\ \hline 5x & = & 5 \end{array}$$

The  $y$ 's add to zero and we have one equation with one variable.

Let's try another one:

$$\begin{array}{rcl} x + 4y & = & 2 \\ 2x + 5y & = & -2 \end{array}$$

This time we don't see a variable that can be immediately eliminated if we add the equations.

But if we multiply the first equation by  $-2$ , we will make the coefficients of  $x$  opposites. We must multiply every term on both sides of the equation by  $-2$ .

$$\begin{array}{rcl} -2(x + 4y) & = & -2(2) \\ 2x + 5y & = & -2 \\ -2x - 8y & = & -4 \\ 2x + 5y & = & -2 \end{array}$$

Now we see that the coefficients of the  $x$  terms are opposites, so  $x$  will be eliminated when we add these two equations.

Add the equations yourself—the result should be  $-3y = -6$ . And that looks easy to solve, doesn't it? Here is what it would look like.

$$\left\{ \begin{array}{r} -2x - 8y = -4 \\ -2x + 5y = -2 \\ \hline -3y = -6 \end{array} \right.$$

We'll do one more:

$$\begin{array}{rcl} 4x - 3y & = & 10 \\ 3x + 5y & = & -7 \end{array}$$

It doesn't appear that we can get the coefficients of one variable to be opposites by multiplying one of the equations by a constant, unless we use fractions. So instead, we'll have to multiply both equations by a constant.

We can make the coefficients of  $x$  be opposites if we multiply the first equation by **3** and the second by  $-4$ , so we get  **$12x$**  and  **$-12x$** .

$$\begin{array}{rcl} (4x - 3y) & = & 3(10) \\ -4(3x + 5y) & = & -4(-7) \end{array}$$

This gives us these two new equations:

$$\begin{array}{rcl} 12x - 9y & = & 30 \\ -12x + 20y & = & 28 \end{array}$$

When we add these equations,

$$\begin{array}{rcl} 12x - 9y & = & 30 \\ -12x + 20y & = & 28 \\ \hline -29y & = & 58 \end{array}$$

the  $x$ 's are eliminated and we just have  $-29y = 58$ .

Once we get an equation with just one variable, we solve it. Then we substitute that value into one of the original equations to solve for the remaining variable. And, as always, we check our answer to make sure it is a solution to both of the original equations.

Now we'll see how to use elimination to solve the same system of equations we solved by graphing and by substitution.

## Example 4.3.1

How to Solve a System of Equations by Elimination

Solve the system by elimination.

$$\begin{aligned} 2x + y &= 7 \\ x - 2y &= 6 \end{aligned}$$

### Solution

**Step 1.** Write both equations in standard form.  
If any coefficients are fractions, clear them.

Both equations are in standard form,  $Ax + By = C$ . There are no fractions.

$$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$$

Figure 4.3.1

**Step 2.** Make the coefficients of one variable opposites.  
Decide which variable you will eliminate.  
Multiply one or both equations so that the coefficients of that variable are opposites.

We can eliminate the  $y$ 's by multiplying the first equation by 2.

Multiply both sides of  $2x + y = 7$  by 2.

$$\begin{cases} 2x + y = 7 \\ x - 2y = 6 \end{cases}$$

$$\begin{cases} 2(2x + y) = 2(7) \\ x - 2y = 6 \end{cases}$$

Figure 4.3.2

**Step 3.** Add the equations resulting from Step 2 to eliminate one variable.

We add the  $x$ 's,  $y$ 's, and constants.

$$\begin{cases} 4x + 2y = 14 \\ x - 2y = 6 \\ \hline 5x = 20 \end{cases}$$

Figure 4.3.3

<b>Step 4.</b> Solve for the remaining variable.	Solve for $x$ .	$x = 4$
--	-----------------	---------

Figure 4.3.4

<b>Step 5.</b> Substitute the solution from Step 4 into one of the original equations. Then solve for the other variable.	Substitute $x = 4$ into the second equation, $x - 2y = 6$ . Then solve for $y$ .	$x - 2y = 6$ $4 - 2y = 6$ $-2y = 2$ $y = -1$
---	--	---

Figure 4.3.5

<b>Step 6.</b> Write the solution as an ordered pair.	Write it as $(x, y)$ .	$(4, -1)$
---	------------------------	-----------

Figure 4.3.6

<b>Step 7.</b> Check that the ordered pair is a solution to <b>both</b> original equations.	Substitute $(4, -1)$ into $2x + y = 7$ and $x - 2y = 6$ . Do they make both equations true? Yes!	$2x + y = 7$ $2(4) + (-1) \stackrel{?}{=} 7$ $7 = 7 \checkmark$ $x - 2y = 6$ $4 - 2(-1) \stackrel{?}{=} 6$ $6 = 6 \checkmark$ The solution is $(4, -1)$ .
---	--	---

Figure 4.3.7

# Try It

3) Solve the system by elimination.

$$3x + y = 5$$

$$2x - 3y = 7$$

**Solution**

$(2, -1)$

4) Solve the system by elimination.

$$4x + y = -5$$

$$-2x - 2y = -2$$

**Solution**

$(-2, 3)$

## HOW TO

### How to solve a system of equations by elimination.

1. Write both equations in standard form. If any coefficients are fractions, clear them.
2. Make the coefficients of one variable opposites.
  - Decide which variable you will eliminate.
  - Multiply one or both equations so that the coefficients of that variable are opposites.
3. Add the equations resulting from Step 2 to eliminate one variable.
4. Solve for the remaining variable.
5. Substitute the solution from Step 4 into one of the original equations. Then solve for the other variable.
6. Write the solution as an ordered pair.
7. Check that the ordered pair is a solution to both original equations.

First we'll do an example where we can eliminate one variable right away.

## Example 4.3.2

Solve the system by elimination.

$$x + y = 10$$

$$x - y = 12$$

**Solution**

$$\begin{cases} x + y = 10 \\ x - y = 12 \end{cases}$$

Both equations are in standard form.

The coefficients of  $y$  are already opposites.

**Step 1: Add the two equations to eliminate  $y$ .**

The resulting equation has only 1 variable,  $x$ .

$$\begin{array}{rcl} \begin{cases} x + y & = & 10 \\ x - y & = & 12 \end{cases} \\ \hline 2x & = & 22 \end{array}$$

**Step 2: Solve for  $x$ , the remaining variable.**

**Step 3: Substitute  $x = 11$  into one of the original equations.**

$$\begin{array}{c} x = 11 \\ \swarrow \\ x + y = 10 \end{array}$$

Figure 4.3.8

$$11 + y = 10$$

**Step 4: Solve for the other variable,  $y$ .**

$$y = -1$$

**Step 5: Write the solution as an ordered pair.**

The ordered pair is  $(11, -1)$ .

**Step 6. Check that the ordered pair is a solution to both original equations.**

$$\text{Equation 1: } x + y = 10$$

$$11 + (-1) \stackrel{?}{=} 10$$

$$10 = 10 \checkmark$$

$$\text{Equation 2: } x - y = 12$$

$$11 - (-1) \stackrel{?}{=} 12$$

$$12 = 12 \checkmark$$

The solution is  $(11, -1)$ .

## Try It

5) Solve the system by elimination.

$$2x + y = 5$$

$$x - y = 4$$

**Solution**

$(3, -1)$

6) Solve the system by elimination.

$$x + y = 3$$

$$-2x - y = -1$$

**Solution**

$(-2, 5)$

In Example 4.3.3, we will be able to make the coefficients of one variable opposites by multiplying one equation by a constant.

### Example 4.3.3

Solve the system by elimination.

$$3x - 2y = -2$$

$$5x - 6y = 10$$

**Solution**

$$\begin{cases} 3x - 2y = -2 \\ 5x - 6y = 10 \end{cases}$$

Both equations are in standard form.

None of the coefficients are opposites.

**Step 1:** We can make the coefficients of  $y$  opposites by multiplying the first equation by  $-3$ .

$$\begin{cases} -3(3x - 2y) = -3(-2) \\ 5x - 6y = 10 \end{cases}$$

**Step 2:** Simplify.

$$\begin{cases} -9x + 6y = 6 \\ 5x - 6y = 10 \end{cases}$$

**Step 3:** Add the two equations to eliminate  $y$ .

$$\begin{array}{r} \begin{cases} -9x + 6y = 6 \\ 5x - 6y = 10 \end{cases} \\ \hline -4x = 16 \end{array}$$

**Step 4:** Solve for the remaining variable,  $x$ .

**Step 5:** Substitute  $x = -4$  into one of the original equations.

$$x = -4$$

$$3x - 2y = -2$$

Figure 4.3.9

$$3(-4) - 2y = -2$$

**Step 6: Solve for  $y$ .**

$$-12 - 2y = -2$$

$$-2y = 10$$

$$y = -5$$

**Step 7: Write the solution as an ordered pair.**

The ordered pair is  $(-4, -5)$ .

**Step 8: Check that the ordered pair is a solution to both original equations.**

$$\text{Equation 1: } 3x - 2y = -2$$

$$3(-4) - 2(-5) \stackrel{?}{=} -2$$

$$-12 + 10 \stackrel{?}{=} -2$$

$$-2 = -2 \checkmark$$

$$\text{Equation 2: } 5x - 6y = 10$$

$$3(-4) - 6(-5) \stackrel{?}{=} 10$$

$$-20 + 30 \stackrel{?}{=} 10$$

$$10 = 10 \checkmark$$

The solution is  $(-4, -5)$ .

## Try It

7) Solve the system by elimination.

$$4x - 3y = 1$$

$$5x - 9y = -4$$

**Solution**

$(1, 1)$

8) Solve the system by elimination.

$$3x + 2y = 2$$

$$6x + 5y = 8$$

**Solution**

$(-2, 4)$

Now we'll do an example where we need to multiply both equations by constants in order to make the coefficients of one variable opposites.

## Example 4.3.4

Solve the system by elimination.

$$4x - 3y = 9$$

$$7x + 2y = -6$$

**Solution**

In this example, we cannot multiply just one equation by any constant to get opposite

coefficients. So we will strategically multiply both equations by a constant to get the opposites.

$$\begin{cases} 4x - 3y = 9 \\ 7x + 2y = -6 \end{cases}$$

**Step 1:** Both equations are in standard form. To get opposite coefficients of  $y$ , we will multiply the first equation by 2 and the second equation by 3.

$$\begin{cases} -3(3x - 2y) = -3(-2) \\ 5x - 6y = 10 \end{cases}$$

**Step 2:** Simplify.

$$\begin{cases} 8x - 6y = 18 \\ 21x + 6y = -18 \end{cases}$$

**Step 3:** Add the two equations to eliminate  $y$ .

$$\begin{array}{r} \begin{cases} 8x - 6y = 18 \\ 21x + 6y = -18 \end{cases} \\ \hline 39x = 0 \end{array}$$

**Step 4:** Solve for  $x$ .

**Step 5:** Substitute  $x = 0$  into one of the original equations.

$$\begin{array}{c} x = 0 \\ \swarrow \\ 7x + 2y = -6 \end{array}$$

Figure 4.3.10

$$7 \times 0 + 2y = -6$$

**Step 6:** Solve for  $y$ .

$$2y = -6$$

$$y = -3$$

**Step 7:** Write the solution as an ordered pair.

The ordered pair is  $(0, -3)$ .

**Step 8:** Check that the ordered pair is a solution to both original equations.

$$\begin{array}{rcl}
 4x - 3y & = & 9 \\
 4(0) - 3(-3) & \stackrel{?}{=} & 9 \\
 9 & = & 9\checkmark
 \end{array}
 \qquad
 \begin{array}{rcl}
 7x + 2y & = & -6 \\
 7(0) + 2(-3) & \stackrel{?}{=} & -6 \\
 -6 & = & -6\checkmark
 \end{array}$$

The solution is  $(0, -3)$ .

What other constants could we have chosen to eliminate one of the variables? Would the solution be the same?

## Try It

9) Solve the system by elimination.

$$\begin{array}{l}
 3x - 4y = -9 \\
 5x + 3y = 14
 \end{array}$$

**Solution**

$(1, 3)$

10) Solve the system by elimination.

$$\begin{array}{l}
 7x + 8y = 4 \\
 3x - 5y = 27
 \end{array}$$

**Solution**

$(4, -3)$

When the system of equations contains fractions, we will first clear the fractions by multiplying each equation by its LCD.

### Example 4.3.5

Solve the system by elimination.

$$\begin{aligned}x + \frac{1}{2}y &= 6 \\ \frac{3}{2}x + \frac{2}{3}y &= \frac{17}{2}\end{aligned}$$

#### Solution

In this example, both equations have fractions. Our first step will be to multiply each equation by its LCD to clear the fractions.

$$\begin{cases} x + \frac{1}{2}y = 6 \\ \frac{3}{2}x + \frac{2}{3}y = \frac{17}{2} \end{cases}$$

**Step 1: To clear the fractions, multiply each equation by its LCD.**

$$\begin{cases} 2(x + \frac{1}{2}y) = 2(6) \\ 6(\frac{3}{2}x + \frac{2}{3}y) = 6(\frac{17}{2}) \end{cases}$$

**Step 2: Simplify.**

$$\begin{cases} 2x + y = 12 \\ 9x + 4y = 51 \end{cases}$$

Now we are ready to eliminate one of the variables. Notice that both equations are in standard form.

**Step 3: We can eliminate  $y$  multiplying the top equation by  $-4$ .**

$$\begin{cases} -4(2x + y) = -4(12) \\ 9x + 4y = 51 \end{cases}$$

**Step 4: Simplify and add.**

**Step 5: Substitute  $x = 3$  into one of the original equations.**

$$\begin{array}{r} -8x - 4y = -48 \\ 9x + 4y = 51 \\ \hline x = 3 \end{array}$$

$$x + \frac{1}{2}y = 6$$

Figure 4.3.11

**Step 6: Solve for  $y$ .**

$$\begin{aligned} 3 + \frac{1}{2}y &= 6 \\ \frac{1}{2}y &= 3 \\ y &= 6 \end{aligned}$$

**Step 7: Write the solution as an ordered pair.**

The ordered pair is  $(3, 6)$ .

**Step 8: Check that the ordered pair is a solution to both original equations.**

$$\text{Equation 1: } x + \frac{1}{2}y = 6$$

$$3 + \frac{1}{2}(6) \stackrel{?}{=} 6$$

$$3 + 3 = 6$$

$$6 = 6$$

$$\text{Equation 2: } \frac{3}{2}x + \frac{2}{3}y = \frac{17}{2}$$

$$\frac{3}{2}(3) + \frac{2}{3}(6) \stackrel{?}{=} \frac{17}{2}$$

$$\frac{9}{2} + 4 \stackrel{?}{=} \frac{17}{2}$$

$$\frac{9}{2} + \frac{8}{2} \stackrel{?}{=} \frac{17}{2}$$

$$\frac{17}{2} = \frac{17}{2}$$

The solution is  $(3, 6)$ .

## Try It

11) Solve the system by elimination.

$$\begin{aligned}\frac{1}{3}x - \frac{1}{2}y &= 1 \\ \frac{3}{4}x - y &= \frac{5}{2}\end{aligned}$$

**Solution**

$(6, 2)$

12) Solve the system by elimination.

$$\begin{aligned}x + \frac{3}{5}y &= -\frac{1}{5} \\ -\frac{1}{2}x - \frac{2}{3}y &= \frac{5}{6}\end{aligned}$$

**Solution**

$(1, -2)$

In the [Solving Systems of Equations by Graphing](#) we saw that not all systems of linear equations have a single ordered pair as a solution. When the two equations were really the same line, there were infinitely many solutions. We called that a consistent system. When the two equations described parallel lines, there was no solution. We called that an inconsistent system.

## Example 4.3.6

Solve the system by elimination.

$$\begin{aligned} 3x + 4y &= 12 \\ y &= 3 - \frac{3}{4}x \end{aligned}$$

**Solution**

$$\begin{cases} 23x + 4y = 12 \\ y = 3 - \frac{3}{4}x \end{cases}$$

**Step 1: Write the second equation in standard form.**

$$\begin{cases} 23x + 4y = 12 \\ y = 3 - \frac{3}{4}x \end{cases}$$

**Step 2: Clear the fractions by multiplying the second equation by 4.**

$$\begin{cases} 3x + 4y = 12 \\ 4\left(\frac{3}{4}x + y\right) = 4(3) \end{cases}$$

**Step 3: Simplify.**

$$\begin{cases} 3x + 4y = 12 \\ 3x + 4y = 12 \end{cases}$$

**Step 4: To eliminate a variable, we multiply the second equation by  $-1$ .**

**Step 5: Simplify and add.**

$$\begin{cases} 3x + 4y = 12 \\ -3x - 4y = 12 \\ \hline 0 = 0 \end{cases}$$

This is a true statement. The equations are consistent but dependent. Their graphs would be the same line. The system has infinitely many solutions.

After we cleared the fractions in the second equation, did you notice that the two equations were the same? That means we have coincident lines.

## Try It

13) Solve the system by elimination.

$$\begin{aligned} 5x - 3y &= 15 \\ y &= -5 + \frac{5}{3}x \end{aligned}$$

### Solution

Infinitely many solutions.

14) Solve the system by elimination.

$$\begin{aligned} x + 2y &= 6 \\ y &= -\frac{1}{2}x + 3 \end{aligned}$$

### Solution

Infinitely many solutions.

## Example 4.3.7

Solve the system by elimination.

$$\begin{aligned} -6x + 15y &= 10 \\ 2x - 5y &= -5 \end{aligned}$$

### Solution

**Step 1:** The equations are in standard form.

$$\begin{cases} -6x + 15y = 10 \\ 2x - 5y = -5 \end{cases}$$

**Step 2: Multiply the second equation by 3 to eliminate a variable.**

$$\begin{cases} -6x + 15y = 10 \\ 3(2x - 5y) = 3(-5) \end{cases}$$

**Step 3: Simplify and add.**

$$\begin{cases} -6x + 15y = 10 \\ -6x - 15y = -15 \\ \hline 0 \neq -5 \end{cases}$$

This statement is false. The equations are inconsistent and so their graphs would be parallel lines.

The system does not have a solution.

## Try It

15) Solve the system by elimination.

$$\begin{aligned} -3x + 2y &= 8 \\ 9x - 6y &= 13 \end{aligned}$$

**Solution**

No solution.

16) Solve the system by elimination.

$$\begin{aligned} 7x - 3y &= -2 \\ -14x + 6y &= 8 \end{aligned}$$

**Solution**

No solution.

## Solve Applications of Systems of Equations by Elimination

Some applications problems translate directly into equations in standard form, so we will use the elimination method to solve them. As before, we use our Problem Solving Strategy to help us stay focused and organized.

### Example 4.3.8

The sum of two numbers is 39. Their difference is 9. Find the numbers.

#### **Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

We are looking for two numbers.

**Step 3: Name what we are looking for.**

Choose a variable to represent that quantity.

Let  $n$  = the first number.

Let  $m$  = the second number.

**Step 4: Translate into a system of equations.**

The system is:

The sum of two numbers is 39.

$$n + m = 39$$

Their difference is 9.

$$n - m = 9$$

$$n + m = 39$$

$$n - m = 9$$

**Step 5: Solve the system of equations.**

To solve the system of equations, use elimination.

The equations are in standard form and the coefficients of  $m$  are opposites. Add.

Solve for  $n$ .

Substitute  $n = 24$  into one of the original equations and solve for  $m$ .

$$\begin{array}{rcl} \left\{ \begin{array}{l} n + m = 39 \\ -n - m = 9 \end{array} \right. & & \\ \hline & 2n & = 48 \end{array}$$

$$n = 24$$

$$n + m = 39$$

$$24 + m = 39$$

$$m = 15$$

**Step 6: Check the answer.**

Since  $24 + 15 = 39$  and  $24 - 15 = 9$ , the answers check.

**Step 7: Answer the question.**

The numbers are **24** and **15**.

## Try It

17) The sum of two numbers is **42**. Their difference is **8**. Find the numbers.

**Solution**

The numbers are **25** and **17**.

18) The sum of two numbers is **−15**. Their difference is **−35**. Find the numbers.

**Solution**

The numbers are **−25** and **10**.

### Example 4.3.9

Joe stops at a burger restaurant every day on his way to work. Monday he had one order of medium fries and two small sodas, which had a total of **620** calories. Tuesday he had two orders of medium fries and one small soda, for a total of **820** calories. How many calories are there in one order of medium fries? How many calories in one small soda?

#### Solution

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

We are looking for the number of calories in one order of medium fries and in one small soda.

**Step 3: Name what we are looking for.**

Let  $f$  = the number of calories in **1** order of medium fries.

Let  $s$  = the number of calories in **1** small soda.

**Step 4: Translate into a system of equations:**

Our system is:

one medium fries and two small sodas had a total of **620** calories

$$f + 2s = 620$$

two medium fries and one small soda had a total of **820** calories.

$$2f + s = 820$$

$$\begin{cases} f + 2s = 620 \\ 2f + s = 820 \end{cases}$$

**Step 5: Solve the system of equations.**

To solve the system of equations, use elimination. The equations are in standard form. To get opposite coefficients of  $f$ , multiply the top equation by  $-2$ . Simplify and add. Solve for  $s$ . Substitute  $s = 140$  into one of the original equations and then solve for  $f$ .

$$\begin{cases} -2(f + 2s) = -2(620) \\ 2f + s = 820 \end{cases}$$

$$\begin{array}{r} \left\{ \begin{array}{l} -2f - 4s = -1240 \\ 2f + s = 820 \end{array} \right. \\ \hline -3s = -420 \end{array}$$

$$s = 140$$

$$f + 2s = 620$$

$$f + 2 \times 140 = 620$$

$$f + 280 = 620$$

$$f = 340$$

**Step 6: Check the answer.**

Verify that these numbers make sense in the problem and that they are solutions to both equations. We leave this to you!

**Step 7: Answer the question.**

The small soda has **140** calories and the fries have **340** calories.

## Try It

19) Malik stops at the grocery store to buy a bag of diapers and **2** cans of formula. He spends a total of **\$37**. The next week he stops and buys **2** bags of diapers and **5** cans of formula for a total of **\$87**. How much does a bag of diapers cost? How much is one can of formula?

**Solution**

The bag of diapers costs **\$11** and the can of formula costs **\$13**.

20) To get her daily intake of fruit for the day, Sasha eats a banana and **8** strawberries on Wednesday for a calorie count of **145**. On the following Wednesday, she eats two bananas and **5** strawberries for a total of **235** calories for the fruit. How many calories are there in a banana? How many calories are in a strawberry?

**Solution**

There are **105** calories in a banana and **5** calories in a strawberry.

## Choose the Most Convenient Method to Solve a System of Linear Equations

When you will have to solve a system of linear equations in a later math class, you will usually not be told which method to use. You will need to make that decision yourself. So you'll want to choose the method that is easiest to do and minimizes your chance of making mistakes.

Graphing	Substitution	Elimination
Use when you need a picture of the situation.	Use when one equation is already solved for one variable.	Use when the equations are in standard form.

Figure 4.1.1

### Example 4.3.10

For each system of linear equations decide whether it would be more convenient to solve it by substitution or elimination. Explain your answer.

a.

$$\begin{aligned} 3x + 8y &= 40 \\ 7x - 4y &= -32 \end{aligned}$$

b.

$$\begin{aligned} 5x + 6y &= 12 \\ y &= \frac{2}{3}x - 1 \end{aligned}$$

**Solution**

a.

$$\begin{aligned}3x + 8y &= 40 \\ 7x - 4y &= -32\end{aligned}$$

Since both equations are in standard form, using elimination will be most convenient.

---

b.

$$\begin{aligned}5x + 6y &= 12 \\ y &= \frac{2}{3}x - 1\end{aligned}$$

Since one equation is already solved for  $y$ , using substitution will be most convenient.

## Try It

21) For each system of linear equations, decide whether it would be more convenient to solve it by substitution or elimination. Explain your answer.

a.

$$\begin{aligned}4x - 5y &= -32 \\ 3x + 2y &= -1\end{aligned}$$

b.

$$\begin{aligned}x &= 2y - 1 \\ 3x - 5y &= -7\end{aligned}$$

### Solution

a. Since both equations are in standard form, using elimination will be most convenient.

b. Since one equation is already solved for  $x$ , using substitution will be most convenient.

22) For each system of linear equations, decide whether it would be more convenient to solve it by substitution or elimination. Explain your answer.

a.

$$\begin{aligned} y &= 2x - 1 \\ 3x - 4y &= -6 \end{aligned}$$

b.

$$\begin{aligned} 6x - 2y &= 12 \\ 3x + 7y &= -13 \end{aligned}$$

### Solution

- a. Since one equation is already solved for  $y$ , using substitution will be most convenient.  
 b. Since both equations are in standard form, using elimination will be most convenient.

Access these online resources for additional instruction and practice with solving systems of linear equations by elimination.

- [Instructional Video-Solving by Elimination](#)
- [Instructional Video-Solving Systems by Elimination](#)

## Key Concepts

### • To Solve a System of Equations by Elimination

1. Write both equations in standard form. If any coefficients are fractions, clear them.

2. Make the coefficients of one variable opposites.
  - Decide which variable you will eliminate.
  - Multiply one or both equations so that the coefficients of that variable are opposites.
3. Add the equations resulting from Step 2 to eliminate one variable.
4. Solve for the remaining variable.
5. Substitute the solution from Step 4 into one of the original equations. Then solve for the other variable.
6. Write the solution as an ordered pair.
7. Check that the ordered pair is a solution to both original equations.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=2369#h5p-12>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## 4.4 SOLVE APPLICATIONS WITH SYSTEMS OF EQUATIONS

---

### Learning Objectives

By the end of this section, you will be able to:

- Translate to a system of equations
- Solve direct translation applications
- Solve geometry applications
- Solve uniform motion applications

### Try It

Before you get started, take this readiness quiz:

- 1) The sum of twice a number and nine is **31**. Find the number.
- 2) Twins Jon and Ron together earned **\$96,000** last year. Ron earned **\$8,000** more than three times what Jon earned. How much did each of the twins earn?
- 3) Alessio rides his bike  $3\frac{1}{2}$  hours at a rate of **10** miles per hour. How far did he ride?

Previously in this chapter we solved several applications with systems of linear equations. In this section, we'll look at some specific types of applications that relate two quantities. We'll translate the words into linear equations, decide which is the most convenient method to use, and then solve them.

We will use our Problem Solving Strategy for Systems of Linear Equations.

## HOW TO

### Use a problem solving strategy for systems of linear equations.

1. Read the problem. Make sure all the words and ideas are understood.
2. Identify what we are looking for.
3. Name what we are looking for. Choose variables to represent those quantities.
4. Translate into a system of equations.
5. Solve the system of equations using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

## Translate to a System of Equations

Many of the problems we solved in earlier applications related two quantities. Here are two of the examples from the chapter on **Math Models**.

- The sum of two numbers is negative fourteen. One number is four less than the other. Find the numbers.
- A married couple together earns \$110,000 a year. The wife earns \$16,000 less than twice what her husband earns. What does the husband earn?

In that chapter, we translated each situation into one equation using only one variable. Sometimes it was a bit of a challenge figuring out how to name the two quantities, wasn't it?

Let's see how we can translate these two problems into a system of equations with two variables. We'll focus on Steps 1 through 4 of our Problem Solving Strategy.

## Example 4.4.1

How to Translate to a System of Equations

Translate to a system of equations:

The sum of two numbers is negative fourteen. One number is four less than the other. Find the numbers.

### Solution

<b>Step 1. Read</b> the problem. Make sure you understand all the words and ideas.	This is a number problem.	The sum of two numbers is negative fourteen. One number is four less than the other. Find the numbers.
--	---------------------------	--

Figure 4.4.1

<b>Step 2. Identify</b> what you are looking for.	"Find the numbers."	We are looking for 2 numbers.
---	---------------------	-------------------------------

Figure 4.4.2

<b>Step 3. Name</b> what you are looking for. Choose variables to represent those quantities.	We will use two variables, $m$ and $n$ .	Let $m$ = one number $n$ = second number
---	--	---

Figure 4.4.3

**Step 4. Translate** into a system of equations.

We will write one equation for each sentence.

The sum of the numbers is  $-14$   
 $m + n = -14$

One number is four less than the other  
 $m = n - 4$

The system is:  $\begin{cases} m + n = -14 \\ m = n - 4 \end{cases}$

Figure 4.4.4

## Try It

4) Translate to a system of equations: The sum of two numbers is negative twenty-three. One number is 7 less than the other. Find the numbers.

**Solution**

$$\begin{cases} m + n = -23 \\ m = n - 7 \end{cases}$$

5) Translate to a system of equations: The sum of two numbers is negative eighteen. One number is 40 more than the other. Find the numbers.

**Solution**

$$\begin{cases} m + n = -18 \\ m = n + 40 \end{cases}$$

We'll do another example where we stop after we write the system of equations.

### Example 4.4.2

Translate to a system of equations:

A married couple together earns \$110,000 a year. The wife earns \$16,000 less than twice what her husband earns. What does the husband earn?

#### Solution

**Step 1: We are looking for the amount that the husband and wife each earn.**

Let  $h$  = the amount the husband earns.

Let  $w$  = the amount the wife earns.

**Step 2: Translate.**

A married couple together earns \$110,000.

$$w + h = 110,000$$

The wife earns \$16,000 less than twice what the husband earns.

$$w = 2h - 16,000$$

**Step 3: The system of equations is:**

$$\begin{cases} w + h = 110,000 \\ w = 2h - 16,000 \end{cases}$$

### Try It

6) Translate to a system of equations: A couple has a total household income of \$84,000. The husband earns \$18,000 less than twice what the wife earns. How much does the wife earn?

**Solution**

$$\begin{cases} w + h = 84,000 \\ h = 2w - 18,000 \end{cases}$$

7) Translate to a system of equations: A senior employee makes \$5 less than twice what a new employee makes per hour. Together they make \$43 per hour. How much does each employee make per hour?

**Solution**

$$\begin{cases} s = 2n - 5 \\ s + n = 43 \end{cases}$$

## Solve Direct Translation Applications

We set up but did not solve, the systems of equations in Examples 4.2.1 and 4.2.2. Now we'll translate a situation to a system of equations and then solve it.

### Example 4.4.3

Translate to a system of equations and then solve: Devon is 26 years older than his son Cooper. The sum of their ages is 50. Find their ages.

**Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

We are looking for the ages of Devon and Cooper.

**Step 3: Name what we are looking for.**

Let  $d$  = Devon's age.

Let  $c$  = Cooper's age

**Step 4: Translate into a system of equations.**

Devon is 26 years older than Cooper.

$$d = c + 26$$

The sum of their ages is 50.

$$d + c = 50$$

The system is:

$$\begin{cases} d = c + 26 \\ d + c = 50 \end{cases}$$

**Step 5: Solve the system of equations.**

Solve by substitution.

Figure 4.4.5

Substitute  $c + 26$  into the second equation.

$$c + 26 + c = 50$$

Solve for  $c$ .

$$2c + 26 = 50$$

$$2c = 24$$

$$c = 12$$

Substitute  $c = 12$ .

$$d = c + 26$$

Solve for  $d$ .

$$d = 12 + 26$$

$$d = 38$$

**Step 6: Check the answer in the problem.**

Is Devon's age 26 more than Cooper's?

Yes, 38 is 26 more than 12.

Is the sum of their ages 50?

Yes, 38 plus 12 is 50.

**Step 7: Answer the question.**

Devon is 38 and Cooper is 12 years old.

## Try It

8) Translate to a system of equations and then solve: Ali is **12** years older than his youngest sister, Jameela. The sum of their ages is **40**. Find their ages.

**Solution**

Ali is **28** and Jameela is **16**.

9) Translate to a system of equations and then solve: Jake's dad is **6** more than **3** times Jake's age. The sum of their ages is **42**. Find their ages.

**Solution**

Jake is **9** and his dad is **33**.

## Example 4.4.4

Translate to a system of equations and then solve:

When Jenna spent 10 minutes on the elliptical trainer and then did circuit training for 20 minutes, her fitness app says she burned 278 calories. When she spent 20 minutes on the elliptical trainer and 30 minutes circuit training she burned 473 calories. How many calories does she burn for each minute on the elliptical trainer? How many calories does she burn for each minute of circuit training?

**Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

We are looking for the number of calories burned each minute on the elliptical trainer and each minute of circuit training.

**Step 3: Name what we are looking for.**

Let  $e$  = number of calories burned per minute on the elliptical trainer.

Let  $c$  = number of calories burned per minute while circuit training.

**Step 4: Translate into a system of equations.**

10 minutes on the elliptical and circuit training for 20 minutes, burned 278 calories

$$10e + 20c = 278$$

20 minutes on the elliptical and 30 minutes of circuit training burned 473 calories

$$20e + 30c = 473$$

The system is:

$$\begin{cases} 10e + 20c = 278 \\ 20e + 30c = 473 \end{cases}$$

**Step 5: Solve the system of equations.**

Multiply the first equation by  $-2$  to get opposite coefficients of  $e$ .

$$\begin{cases} -2(10e + 20c) = -2(278) \\ 20e + 30c = 473 \end{cases}$$

Simplify and add the equations.

Solve for  $c$ .

$$\begin{array}{r} \begin{cases} -20e - 40c = -556 \\ 20e + 30c = 473 \end{cases} \\ \hline -10c = -83 \\ c = 8.3 \end{array}$$

Substitute  $c = 8.3$  into one of the original equations to solve for  $e$ .

$$\begin{aligned} 10e + 20c &= 278 \\ 10e + 20(8.3) &= 278 \\ 10e + 166 &= 278 \\ 10e &= 112 \\ e &= 11.2 \end{aligned}$$

**Step 6: Check the answer in the problem.**

Check the math on your own.

$$\begin{cases} 10(11.2) + 20(8.3) \stackrel{?}{=} 278 \\ 20(11.2) + 30(8.3) \stackrel{?}{=} 473 \end{cases}$$

**Step 7: Answer the question.**

Jenna burns 8.3 calories per minute circuit training and 11.2 calories per minute while on the elliptical trainer.

**Try It**

10) *Translate to a system of equations and then solve:* Mark went to the gym and did **40** minutes of Bikram hot yoga and **10** minutes of jumping jacks. He burned **510** calories. The next time he went to the gym, he did **30** minutes of Bikram hot yoga and **20** minutes of jumping jacks burning **470** calories. How many calories were burned for each minute of yoga? How many calories were burned for each minute of jumping jacks?

**Solution**

Mark burned **11** calories for each minute of yoga and **7** calories for each minute of jumping jacks.

11) *Translate to a system of equations and then solve:* Erin spent **30** minutes on the rowing machine and **20** minutes lifting weights at the gym and burned **430** calories. During her next visit to the gym she spent **50** minutes on the rowing machine and **10** minutes lifting weights and burned **600** calories. How many calories did she burn for each minutes on the rowing machine? How many calories did she burn for each minute of weight lifting?

**Solution**

Erin burned **11** calories for each minute on the rowing machine and **5** calories for each minute of weight lifting.

## Solve Geometry Applications

When we learned about **Math Models**, we solved geometry applications using properties of triangles and rectangles. Now we'll add to our list some properties of angles.

The measures of two **complementary angles** add to 90 degrees. The measures of two **supplementary angles** add to 180 degrees.

### Complementary and Supplementary Angles

Two angles are **complementary** if the sum of the measures of their angles is 90 degrees.

Two angles are **supplementary** if the sum of the measures of their angles is 180 degrees.

---

If two angles are complementary, we say that *one angle is the **complement** of the other.*

If two angles are supplementary, we say that *one angle is the **supplement** of the other.*

### Example 4.4.5

Translate to a system of equations and then solve: The difference of two complementary angles is 26 degrees. Find the measures of the angles.

#### Solution

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

We are looking for the measure of each angle.

**Step 3: Name what we are looking for.**

Let  $x$  = the measure of the first angle.

Let  $m$  = the measure of the second angle.

**Step 4: Translate into a system of equations.**

The angles are complementary.

$$x + y = 90$$

The difference of the two angles is 26 degrees.

$$x - y = 26$$

The system is

$$\begin{cases} x + y = 90 \\ x - y = 26 \end{cases}$$

**Step 5: Solve the system of equations by elimination.**

$$\begin{cases} x + y = 90 \\ x - y = 26 \end{cases}$$

$$2x = 116$$

$$x = 58$$

Substitute  $x = 58$  into the first equation.

$$x + y = 90$$

$$58 + y = 90$$

$$y = 32$$

**Step 6: Check the answer in the problem.**

$$58 + 32 = 90 \checkmark$$

$$58 - 32 = 26 \checkmark$$

**Step 7: Answer the question.**

The angle measures are 58 degrees and 32 degrees.

## Try It

12) Translate to a system of equations and then solve: The difference of two complementary angles is **20** degrees. Find the measures of the angles.

### **Solution**

The angle measures are **55** degrees and **35** degrees.

13) Translate to a system of equations and then solve: The difference of two complementary angles is **80** degrees. Find the measures of the angles.

### **Solution**

The angle measures are **5** degrees and **85** degrees.

## Example 4.4.6

Translate to a system of equations and then solve:

Two angles are supplementary. The measure of the larger angle is twelve degrees less than five times the measure of the smaller angle. Find the measures of both angles.

### **Solution**

**Step 1: Read the problem.**

**Step 2: Identify what we are looking for.**

We are looking for the measure of each angle.

**Step 3: Name what we are looking for.**

Let  $x$  = the measure of the first angle.

Let  $y$  = the measure of the second angle

**Step 4: Translate into a system of equations.**

The angles are supplementary.

$$x + y = 180$$

The larger angle is twelve less than five times the smaller angle

$$y = 5x - 12$$

The system is:

$$\begin{cases} x + y = 180 \\ y = 5x - 12 \end{cases}$$

**Step 5: Solve the system of equations substitution.**

$$\begin{cases} x + y = 180 \\ y = 5x - 12 \end{cases}$$

$$x + 5x - 12 = 180$$

Figure 4.4.6

Substitute  $5x - 12$  for  $y$  in the first equation.

$$x + 5x - 12 = 180$$

Solve for  $x$ .

$$6x - 12 = 180$$

$$6x = 192$$

$$\text{Substitute in } x=32. \quad y = 5x - 12$$

$$\text{Solve for } y. \quad y = 5 \times 32 - 12$$

$$y = 160 - 12$$

$$y = 148$$

**Step 6: Check the answer in the problem.**

$$32 + 148 = 180 \checkmark$$

$$5 \times 32 - 12 = 148 \checkmark$$

**Step 7: Answer the question.**

The angle measures are **148** and **32**.

## Try It

14) *Translate to a system of equations and then solve:* Two angles are supplementary. The measure of the larger angle is **12** degrees more than three times the smaller angle. Find the measures of the angles.

**Solution**

The angle measures are **42** degrees and **138** degrees.

15) *Translate to a system of equations and then solve:* Two angles are supplementary. The measure of the larger angle is **18** less than twice the measure of the smaller angle. Find the measures of the angles.

**Solution**

The angle measures are **66** degrees and **114** degrees.

## Example 4.4.7

Translate to a system of equations and then solve:

Randall has **125** feet of fencing to enclose the rectangular part of his backyard adjacent to his house. He will only need to fence around three sides, because the fourth side will be the wall of the house. He wants the length of the fenced yard (parallel to the house wall) to be **5** feet more than four times as long as the width. Find the length and the width.

**Solution**

**Step 1: Read the problem.**

**Step 2: Identify what you are looking for.**

We are looking for the length and width.

Figure 4.4.7

**Step 3: Name what we are looking for.**

Let  $L$  = the length of the fenced yard.

Let  $W$  = the width of the fenced yard

**Step 4: Translate into a system of equations.**

One length and two widths equal 125.

$$L + 2W = 125$$

The length will be 5 feet more than four times the width.

$$L = 4W + 5$$

The system is:

$$\begin{cases} L + 2W = 125 \\ L = 4W + 5 \end{cases}$$

**Step 5: Solve the system of equations by substitution.**

$$\begin{cases} L + 2W = 125 \\ L = 4W + 5 \end{cases}$$

$$L + 2W = 125$$

Figure 4.4.8

Substitute  $L = 4W + 5$  into the first equation, then solve for  $W$ .

$$4W + 5 + 2W = 125$$

$$6W + 5 = 125$$

$$6W = 120$$

Substitute 20 for  $W$  in the second equation, then solve for  $L$ .

$$\text{Substitute } W=20. \quad L = 4W + 5$$

$$\text{Solve for } L. \quad L = 4 \times 20 + 5$$

$$L = 80 + 5$$

$$L = 85$$

**Step 6: Check the answer in the problem.**

$$20 + 28 + 20 = 125 \checkmark$$

$$85 = 4 \times 20 + 5 \checkmark$$

**Step 7: Answer the equation.**

The length is 85 feet and the width is 20 feet.

## Try It

16) *Translate to a system of equations and then solve:* Mario wants to put a rectangular fence around the pool in his backyard. Since one side is adjacent to the house, he will only need to fence three sides. There are two long sides and the one shorter side is parallel to the house. He needs 155 feet of fencing to enclose the pool. The length of the long side is 10 feet less than twice the width. Find the length and width of the pool area to be enclosed.

### Solution

The length is 60 feet and the width is 35 feet.

17) *Translate to a system of equations and then solve:* Alexis wants to build a rectangular dog run in her yard adjacent to her neighbour's fence. She will use 136 feet of fencing to completely enclose the rectangular dog run. The length of the dog run along the neighbour's fence will be 16 feet less than twice the width. Find the length and width of the dog run.

### Solution

The length is 60 feet and the width is 38 feet.

## Solve Uniform Motion Applications

We used a table to organize the information in uniform motion problems when we introduced them earlier. We'll continue using the table here. The basic equation was  $D = rt$  where  $D$  is the distance travelled,  $r$  is the rate, and  $t$  is the time.

Our first example of a uniform motion application will be for a situation similar to some we have already seen, but now we can use two variables and two equations.

### Example 4.4.8

Translate to a system of equations and then solve:

Joni left St. Louis on the interstate, driving west towards Denver at a speed of **65** miles per hour. Half an hour later, Kelly left St. Louis on the same route as Joni, driving **78** miles per hour. How long will it take Kelly to catch up to Joni?

#### Solution

A diagram is useful in helping us visualize the situation.

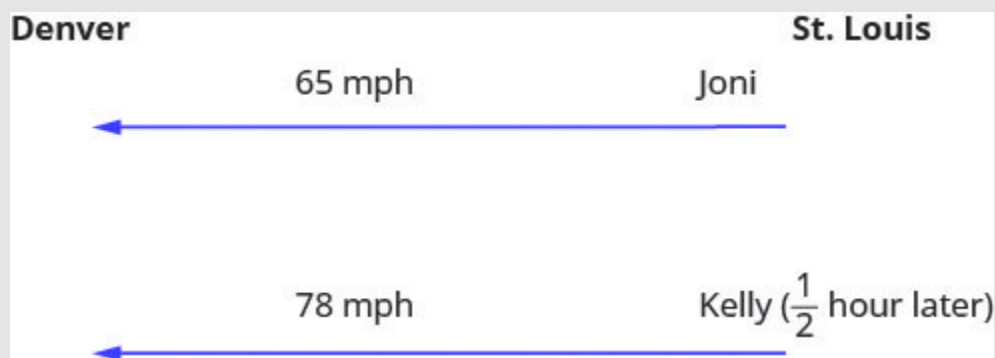

Figure 4.4.9

#### Step 1: Identify and name what we are looking for.

A chart will help us organize the data. We know the rates of both Joni and Kelly, and so we enter them in the chart.

We are looking for the length of time Kelly,  $k$ , and Joni,  $j$ , will each drive. Since  $D = r \cdot t$  we can fill in the Distance column.

Type	Rate x Time = Distance		
Joni	65	$j$	$65j$
Kelly	78	$k$	$78k$

**Step 2: Translate into a system of equations.**

To make the system of equations, we must recognize that Kelly and Joni will drive the same distance. So,  $65j = 78k$ .

Also, since Kelly left later, her time will be  $\frac{1}{2}$  hour less than Joni's time.

$$\text{So, } k = j - \frac{1}{2}$$

Now we have the system.

$$\begin{cases} k = j - \frac{1}{2} \\ 65j = 78k \end{cases}$$

**Step 3: Solve the system of equations by substitution.**

$$65j = 78k$$

Substitute  $k = j - \frac{1}{2}$  into the second equation, then solve for  $j$ .

$$\begin{aligned} 65j &= 78\left(j - \frac{1}{2}\right) \\ 65j &= 78j - 39 \\ -13j &= -39 \\ j &= 3 \end{aligned}$$

To find Kelly's time, substitute  $j = 3$  into the first equation, then solve for  $k$ .

$$\begin{aligned} \text{Solve for } k. \quad k &= j - \frac{1}{2} \\ k &= 3 - \frac{1}{2} \\ k &= \frac{5}{2} \text{ or } k = 2\frac{1}{2} \end{aligned}$$

**Step 4: Check the answer in the problem.**

Joni **3** hours (**65**mph) = **195** miles.

Kelly  $2\frac{1}{2}$  hours (**78** mph) = **195** miles.

Yes, they will have travelled the same distance when they meet.

**Step 5: Answer the question.**

Kelly will catch up to Joni in  $2\frac{1}{2}$  hours. By then, Joni will have travelled **3** hours.

## Try It

18) *Translate to a system of equations and then solve:* Mitchell left Detroit on the interstate driving south towards Orlando at a speed of **60** miles per hour. Clark left Detroit **1** hour later travelling at a speed of **75** miles per hour, following the same route as Mitchell. How long will it take Clark to catch Mitchell?

**Solution**

It will take Clark **4** hours to catch Mitchell.

19) *Translate to a system of equations and then solve:* Charlie left his mother's house travelling at an average speed of **36** miles per hour. His sister Sally left **15** minutes ( $\frac{1}{4}$  hour) later travelling the same route at an average speed of **42** miles per hour. How long before Sally catches up to Charlie?

**Solution**

It will take Sally  $1\frac{1}{2}$  hours to catch up to Charlie.

Many real-world applications of uniform motion arise because of the effects of currents—of water or air—on the actual speed of a vehicle. Cross-country airplane flights in the United States generally take longer going west than going east because of the prevailing wind currents.

Let's take a look at a boat travelling on a river. Depending on which way the boat is going, the current of the water is either slowing it down or speeding it up.

Figures 4.4.1 and 4.4.2 show how a river current affects the speed at which a boat is actually travelling. We'll call the speed of the boat in still water  $b$  and the speed of the river current  $c$ .

In Figure 4.4.1 boat is going downstream, in the same direction as the river current. The current helps push the boat, so the boat's actual speed is faster than its speed in still water. The actual speed at which the boat is moving is  $b + c$ .

Figure 4.4.10

In Figure 4.4.2 the boat is going upstream, opposite to the river current. The current is going against the boat, so the boat's actual speed is slower than its speed in still water. The actual speed of the boat is  $b - c$ .

Figure 4.4.11

We'll put some numbers to this situation in Example 4.4.9

### Example 4.4.9

Translate to a system of equations and then solve:

A river cruise ship sailed **60** miles downstream for **4** hours and then took **5** hours sailing upstream to return to the dock. Find the speed of the ship in still water and the speed of the river current.

#### Solution

Read the problem.

This is a uniform motion problem and a picture will help us visualize the situation.

Figure 4.4.12

#### Step 1: Identify what we are looking for.

We are looking for the speed of the ship in still water and the speed of the current.

#### Step 2: Name what we are looking for.

Let  $s$  = the rate of the ship in still water.

Let  $c$  = the rate of the current

A chart will help us organize the information. The ship goes downstream and then upstream.

Going downstream, the current helps the ship; therefore, the ship's actual rate is  $s + c$ .

Going upstream, the current slows the ship; therefore, the actual rate is  $s - c$ .

Type	Rate x Time = Distance		
Downstream	$s + c$	4	60
Upstream	$s - c$	5	60

Downstream it takes 4 hours. Upstream it takes 5 hours. Each way the distance is 60 miles.

**Step 3: Translate into a system of equations.**

Since rate times time is distance, we can write the system of equations.

$$\begin{cases} 4(s + c) = 60 \\ 5(s - c) = 60 \end{cases}$$

**Step 4: Solve the system of equations.**

Distribute to put both equations in standard form, then solve by elimination.

$$\begin{cases} 4s + 4c = 60 \\ 5s - 5c = 60 \end{cases}$$

Multiply the top equation by 5 and the bottom equation by 4. Add the equations, then solve for  $s$ .

$$\begin{array}{r} \begin{cases} 20s + 20c = 300 \\ 20s - 20c = 240 \end{cases} \\ \hline 40s = 540 \end{array}$$

Substitute  $s = 13.5$  into one of the original equations.

$$\text{Substitute } s=13.5. \quad 4(s + c) = 60$$

$$4(13.5 + c) = 60$$

$$\text{Solve for } c. \quad 54 + 4c = 60$$

$$4c = 6$$

$$c = 1.5$$

**Step 5: Check the answer in the problem.**

The downstream rate would be  $13.5 + 1.5 = 15 \text{ mph}$ .

In 4 hours the ship would travel  $15 \cdot 4 = 60 \text{ miles}$ .

The upstream rate would be  $13.5 - 1.5 = 12 \text{ mph}$ .

In 5 hours the ship would travel  $12 \cdot 5 = 60 \text{ miles}$ .

**Step 6: Answer the question.**

The rate of the ship is **13.5** mph and the rate of the current is **1.5** mph.

**Try It**

20) *Translate to a system of equations and then solve:* A Mississippi river boat cruise sailed **120** miles upstream for **12** hours and then took **10** hours to return to the dock. Find the speed of the river boat in still water and the speed of the river current.

**Solution**

The rate of the boat is **11** mph and the rate of the current is **1** mph.

21) *Translate to a system of equations and then solve:* Jason paddled his canoe **24** miles upstream for **4** hours. It took him **3** hours to paddle back. Find the speed of the canoe in still water and the speed of the river current.

**Solution**

The speed of the canoe is **7** mph and the speed of the current is **1** mph.

Wind currents affect airplane speeds in the same way as water currents affect boat speeds. We'll see this in Example 4.4.10. A wind current in the same direction as the plane is flying is called a *tailwind*. A wind current blowing against the direction of the plane is called a *headwind*.

**Example 4.4.10**

Translate to a system of equations and then solve:

A private jet can fly **1095** miles in three hours with a tailwind but only **987** miles in three hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

### Solution

Read the problem.

This is a uniform motion problem and a picture will help us visualize.

4.4.13

### Step 1: Identify what we are looking for.

We are looking for the speed of the jet in still air and the speed of the wind.

### Step 2: Name what we are looking for.

Let  $j$  = the speed of the jet in still air.

Let  $w$  = the speed of the wind

A chart will help us organize the information. The jet makes two trips—one in a tailwind and one in a headwind. In a tailwind, the wind helps the jet and so the rate is  $j + w$ . In a headwind, the wind slows the jet and so the rate is  $j - w$ .

Type	Rate x Time = Distance		
Tailwind	$j + w$	3	1095
Headwind	$j - w$	3	987

Each trip takes **3** hours. In a tailwind the jet flies **1095** miles. In a headwind the jet flies **987** miles.

### Step 3: Translate into a system of equations.

Since rate times time is distance, we get the system of equations.

$$\begin{cases} 3(j + w) = 1095 \\ 3(j - w) = 987 \end{cases}$$

**Step 4: Solve the system of equations.**

Distribute, then solve by elimination.

$$\begin{array}{r} \begin{cases} 3j + 3w = 1095 \\ 3j - 3w = 987 \end{cases} \\ \hline 6j = 2082 \end{array}$$

Add, and solve for  $j$ .

Substitute  $j = 347$  into one of the original equations, then solve for  $w$ .

$$\text{Substitute } j=347. \quad 3(j + w) = 1095$$

$$3(347 + w) = 1095$$

$$\text{Solve for } w. \quad 1041 + 3w = 1095$$

$$3w = 54$$

$$w = 18$$

**Step 5: Check the answer in the problem.**

With the tailwind, the actual rate of the jet would be  $347 + 18 = 365 \text{ mph}$ .

In 3 hours the jet would travel  $365 \times 3 = 1095 \text{ miles}$ .

Going into the headwind, the jet's actual rate would be  $347 - 18 = 329 \text{ mph}$ .

In 3 hours the jet would travel  $329 \times 3 = 987 \text{ miles}$ .

**Step 6: Answer the question.**

The rate of the jet is  $347 \text{ mph}$  and the rate of the wind is  $18 \text{ mph}$ .

**Try It**

22) Translate to a system of equations and then solve: A small jet can fly **1,325** miles in **5** hours

with a tailwind but only **1025** miles in **5** hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

**Solution**

The speed of the jet is **235** mph and the speed of the wind is **30** mph.

23) Translate to a system of equations and then solve: A commercial jet can fly **1728** miles in **4** hours with a tailwind but only **1536** miles in **4** hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

**Solution**

The speed of the jet is **408** mph and the speed of the wind is **24** mph.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=2450#h5p-11>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## Glossary

### **complementary angles**

Two angles are complementary if the sum of the measures of their angles is 90 degrees.

### **supplementary angles**

Two angles are supplementary if the sum of the measures of their angles is 180 degrees.

## 4.5 SOLVE MIXTURE APPLICATIONS WITH SYSTEMS OF EQUATIONS

---

### Learning Objectives

By the end of this section, you will be able to:

- Solve mixture applications
- Solve interest applications

### Try It

Before you get started, take this readiness quiz:

- 1) Multiply  $4.025(1,562)$ .
- 2) Write  $8.2\%$  as a decimal.
- 3) Earl's dinner bill came to **\$32.50** and he wanted to leave an **18%** tip. How much should the tip be?

### Solve Mixture Applications

When we solved mixture of applications with coins and tickets earlier, we started by creating a table so we could organize the information. For a coin example with nickels and dimes, the table looked like this:

Figure 4.5.1

Type	Number x Value (\$) = Total Value (\$)		
Nickels		0.05	
Dimes		0.10	

Using one variable meant that we had to relate the number of nickels and the number of dimes. We had to decide if we were going to let  $n$  be the number of nickels and then write the number of dimes in terms of  $n$ , or if we would let  $d$  be the number of dimes and write the number of nickels in terms of  $d$ .

Now that we know how to solve systems of equations with two variables, we'll just let  $n$  be the number of nickels and  $d$  be the number of dimes. We'll write one equation based on the total value column, like we did before, and the other equation will come from the number column.

For the first example, we'll do a ticket problem where the ticket prices are in whole dollars, so we won't need to use decimals just yet.

### Example 4.5.1

Translate to a system of equations and solve:

The box office at a movie theatre sold **147** tickets for the evening show, and receipts totalled **\$1,302**. How many **\$11** adult and how many **\$8** child tickets were sold?

#### Solution

##### Step 1: Read the problem.

We will create a table to organize the information.

##### Step 2: Identify what we are looking for.

We are looking for the number of adult tickets and the number of child tickets sold.

##### Step 3: Name what we are looking for.

Let  $a$  = the number of adult tickets.

Let  $c$  = the number of child tickets

A table will help us organize the data. We have two types of tickets: adult and child.

Write  $a$  and  $c$  for the number of tickets.

Write the total number of tickets sold at the bottom of the Number column.

Altogether **147** were sold.

Write the value of each type of ticket in the Value column.

The value of each adult ticket is **\$11**. The value of each child tickets is **\$8**.

The number times the value gives the total value, so the total value of adult tickets is  $a \cdot 11 = 11a$ , and the total value of child tickets is  $c \cdot 8 = 8c$ .

Type	Number $\times$ Value (\$) = Total Value (\$)		
Adult	$a$	11	$11a$
Child	$c$	8	$8c$
	147		1302

Altogether the total value of the tickets was **\$1,302**.

Fill in the Total Value column.

**Step 4: Translate into a system of equations.**

The Number column and the Total Value column give us the system of equations. We will use the elimination method to solve this system.

$$\begin{cases} a + c = 147 \\ 11a + 8c = 1302 \end{cases}$$

Multiply the first equation by  $-8$ .

$$\begin{cases} -8(a + c) = -8(147) \\ 11a + 8c = 1302 \end{cases}$$

Simplify and add, then solve for  $a$ .

$$\begin{array}{r} \begin{cases} -8a + 8c = -1176 \\ 11a + 8c = 1302 \end{cases} \\ \hline 3a = 126 \end{array}$$

$$a = 42$$

$$a + c = 147$$

Figure 4.5.2

Substitute  $a = 42$  into the first equation, then solve for  $c$ .

$$42 + c = 147$$

$$c = 105$$

**Step 5: Check the answer in the problem.**

42 adult tickets at \$11 per ticket makes \$462.

105 child tickets at \$8 per ticket makes \$840.

The total receipts are \$1,302✓.

**Step 6: Answer the question.**

The movie theatre sold 42 adult tickets and 105 child tickets.

## Try It

4) *Translate to a system of equations and solve:* The ticket office at the zoo sold 553 tickets one day. The receipts totalled \$3,936. How many \$9 adult tickets and how many \$6 child tickets were sold?

**Solution**

There were 206 adult tickets sold and 347 children tickets sold.

5) *Translate to a system of equations and solve:* A science centre sold 1,363 tickets on a busy weekend. The receipts totalled \$12,146. How many \$12 adult tickets and how many \$7 child tickets were sold?

**Solution**

There were 521 adult tickets sold and 842 children tickets sold.

In Example 4.5.2 we'll solve a coin problem. Now that we know how to work with systems of two variables, naming the variables in the 'number' column will be easy.

## Example 4.5.2

Translate to a system of equations and solve:

Priam has a collection of nickels and quarters, with a total value of **\$7.30**. The number of nickels is six less than three times the number of quarters. How many nickels and how many quarters does he have?

### Solution

#### Step 1: Read the problem.

We will create a table to organize the information.

#### Step 2: Identify what we are looking for.

We are looking for the number of nickels and the number of quarters.

#### Step 3: Name what we are looking for.

Let  $n$  = the number of nickels.

Let  $q$  = the number of quarters

A table will help us organize the data. We have two types of coins, nickels and quarters.

Write  $n$  and  $q$  for the number of each type of coin.

Fill in the Value column with the value of each type of coin.

The value of each nickel is **\$0.05**.

The value of each quarter is **\$0.25**.

The number times the value gives the total value, so, the total value of the nickels is  $n(0.05) = 0.05n$  and the total value of quarters is  $q(0.25) = 0.25q$ . Altogether the total value of the coins is **\$7.30**.

Type	Number $\times$ Value (\$) = Total Value (\$)		
Nickels	$n$	0.05	$0.05n$
Quarters	$q$	0.25	$0.25q$
			7.30

**Step 4: Translate into a system of equations.**

The Total value column gives one equation.

$$0.05n + 0.25q = 7.30$$

We also know the number of nickels is six less than three times the number of quarters.

Translate to get the second equation.

$$n = 3q - 6$$

Now we have the system to solve.

$$\begin{cases} 0.05n + 0.25q = 7.30 \\ n = 3q - 6 \end{cases}$$

**Step 5: Solve the system of equations**

We will use the substitution method. Substitute  $n = 3q - 6$  into the first equation.

Simplify and solve for  $q$ .

$$\begin{aligned} 0.05n + 0.25q &= 7.30 \\ 0.05(3q - 6) + 0.25q &= 7.3 \\ 0.15q - 0.3 + 0.25q &= 7.3 \\ 0.4q - 0.3 &= 7.3 \\ 0.4q &= 7.6 \\ q &= 19 \end{aligned}$$

To find the number of nickels, substitute  $q = 19$  into the second equation.

$$\begin{aligned} n &= 3q - 6 \\ n &= 3 \times 19 - 6 \\ n &= 51 \end{aligned}$$

**Step 6: Check the answer in the problem.**

$$19 \text{ quarters at } \$0.25 = \$4.75$$

$$51 \text{ nickels at } \$0.05 = \$2.55$$

$$\text{Total} = \$7.30$$

$$3(19) - 6 = 51 \checkmark$$

**Step 7: Answer the question.**

Priam has 19 quarters and 51 nickels.

## Try It

6) *Translate to a system of equations and solve:* Matilda has a handful of quarters and dimes, with a total value of **\$8.55**. The number of quarters is **3** more than twice the number of dimes. How many dimes and how many quarters does she have?

**Solution**

Matilda has **13** dimes and **29** quarters.

7) *Translate to a system of equations and solve:* Juan has a pocketful of nickels and dimes. The total value of the coins is **\$8.10**. The number of dimes is **9** less than twice the number of nickels. How many nickels and how many dimes does Juan have?

**Solution**

Juan has **36** nickels and **63** dimes.

Some mixture applications involve combining foods or drinks. Example situations might include combining raisins and nuts to make a trail mix or using two types of coffee beans to make a blend.

## Example 4.5.3

Translate to a system of equations and solve:

Carson wants to make **20** pounds of trail mix using nuts and chocolate chips. His budget requires that the trail mix costs him **\$7.60** per pound. Nuts cost **\$9.00** per pound and chocolate chips cost **\$2.00** per pound. How many pounds of nuts and how many pounds of chocolate chips should he use?

**Solution**

**Step 1: Read the problem.**

We will create a table to organize the information.

**Step 2: Identify what we are looking for.**

We are looking for the number of pounds of nuts and the number of pounds of chocolate chips.

**Step 3: Name what we are looking for.**

Let  $n$  = the number of pound of nuts.

Let  $c$  = the number of pounds of chips

Carson will mix nuts and chocolate chips to get trail mix. Write in  $n$  and  $c$  for the number of pounds of nuts and chocolate chips.

There will be **20** pounds of trail mix. Put the price per pound of each item in the Value column. Fill in the last column using Number  $\times$  Value = Total Value

Type	Number of Pounds $\times$ Value (\$) = Total Value (\$)		
Nuts	$n$	9.00	$9n$
Chocolate Chips	$c$	2.00	$2c$
Trail Mix	20	7.60	$7.60(20) = 152$

**Step 4: Translate into a system of equations. We get the equations from the Number and Total Value columns.**

$$\begin{cases} n + c = 20 \\ 9n + 2c = 152 \end{cases}$$

**Step 5: Solve the system of equations. We will use elimination to solve the system.**

Multiply the first equation by  $-2$  to eliminate  $c$ .

$$\begin{cases} -2(n + c) = -2(20) \\ 9n + 2c = 152 \end{cases}$$

Simplify and add. Solve for  $n$ .

$$\begin{array}{r} \begin{cases} -2n - 2c = -40 \\ 9n + 2c = 152 \end{cases} \\ \hline 7n = 112 \end{array}$$

$$n = 16$$

To find the number of pounds of chocolate chips, substitute  $n = 16$  into the first equation, then solve for  $c$ .

$$n + c = 20$$

$$16 + c = 20$$

$$c = 4$$

**Step 6: Check the answer in the problem.**

$$16 + 4 = 20 \checkmark$$

$$9(16) + 2(4) = 152 \checkmark$$

**Step 7: Answer the question.**

Carson should mix **16** pounds of nuts with **4** pounds of chocolate chips to create the trail mix.

## Try It

8) *Translate to a system of equations and solve:* Greta wants to make **5** pounds of a nut mix using peanuts and cashews. Her budget requires the mixture to cost her **\$6** per pound. Peanuts are **\$4** per pound and cashews are **\$9** per pound. How many pounds of peanuts and how many pounds of cashews should she use?

### Solution

Greta should use **3** pounds of peanuts and **2** pounds of cashews.

9) *Translate to a system of equations and solve:* Sammy has most of the ingredients he needs to make a large batch of chili. The only items he lacks are beans and ground beef. He needs a total of **20** pounds combined of beans and ground beef and has a budget of **\$3** per pound. The price of beans is **\$1** per pound and the price of ground beef is **\$5** per pound. How many pounds of beans and how many pounds of ground beef should he purchase?

### Solution

Sammy should purchase **10** pounds of beans and **10** pounds of ground beef.

Another application of mixture problems relates to concentrated cleaning supplies, other chemicals, and mixed drinks. The concentration is given as a percent. For example, a 20% concentrated household cleanser means that **20** of the total amount is cleanser, and the rest is water. To make **35** ounces of a **20** concentration, you mix **7** ounces (**20** of **35**) of the cleanser with **28** ounces of water.

For these kinds of mixture problems, we'll use percent instead of value for one of the columns in our table.

### Example 4.5.4

*Translate to a system of equations and solve:* Sasheena is a lab assistant at her community college. She needs to make **200** millilitres of a **40** solution of sulphuric acid for a lab experiment. The lab has only **25** and **50** solutions in the storeroom. How much should she mix of the **25** and the **50** solutions to make the **40** solution?

#### Solution

##### Step 1: Read the problem.

A figure may help us visualize the situation, then we will create a table to organize the information.

Sasheena must mix some of the 25% solution and some of the 50% solution together to get 200 ml of the 40% solution.

Figure 4.5.3

**Step 2: Identify what we are looking for.**

We are looking for how much of each solution she needs.

**Step 3: Name what we are looking for.**

Let  $x$  = number of ml of 25% solution.

Let  $y$  = number of ml of 50% solution.

A table will help us organize the data.

She will mix  $x$  ml of 25 with  $y$  ml of 50 to get 200 ml of 40 solution.

We write the percents as decimals in the chart.

We multiply the number of units times the concentration to get the total amount of sulphuric acid in each solution.

Type	Number of Units $\times$ Concentration % = Amount		
25%	$x$	0.25	$0.25x$
50%	$y$	0.50	$0.50y$
40%	200	0.40	$0.40(200)$

**Step 4: Translate into a system of equations. We get the equations from the Number column and the Amount column.**

Now we have the system.

$$\begin{cases} x + y = 200 \\ 0.25x + 0.50y = 0.40(200) \end{cases}$$

**Step 5: Solve the system of equations. We will solve the system by elimination. Multiply the first equation by  $-0.5$  to eliminate  $y$ .**

$$\begin{cases} -0.5(x + y) = -0.5(200) \\ 0.25x + 0.50y = 0.40(200) \end{cases}$$

Simplify and add to solve for  $x$ .

$$\begin{array}{rcl} \begin{cases} -0.5x - 0.5y = -100 \\ 0.25x + 0.50y = 0.40(200) \end{cases} & & \\ \hline & -0.25x & = -20 \\ & x & = 80 \end{array}$$

To solve for  $y$ , substitute  $x = 80$  into the first equation.

$$x + y = 200$$

$$80 + y = 200$$

$$y = 120$$

**Step 6: Check the answer in the problem.**

$$80 + 120 = 200 \checkmark$$

$$0.25(80) + 0.50(120) = 80 \checkmark$$

**Step 7: Answer the question.**

Sasheena should mix 80 ml of the 25 solution with 120 ml of the 50 solution to get the 200 ml of the 40 solution.

## Try It

10) *Translate to a system of equations and solve:* LeBron needs 150 millilitres of a 30 solution of sulphuric acid for a lab experiment but only has access to a 25 and a 50 solution. How much of the 25 and how much of the 50 solution should he mix to make the 30 solution?

### Solution

LeBron needs 120 ml of the 25 solution and 30 ml of the 50 solution.

11) *Translate to a system of equations and solve:* Anatole needs to make 250 millilitres of a 25 solution of hydrochloric acid for a lab experiment. The lab only has a 10 solution and a 40 solution in the storeroom. How much of the 10 and how much of the 40 solutions should he mix to make the 25 solution?

### Solution

Anatole should mix 125 ml of the 10 solution and 125 ml of the 40 solution.

## Solve Interest Applications

The formula to model interest applications is  $I = Prt$ . Interest,  $I$ , is the product of the principal,  $P$ , the rate,  $r$ , and the time,  $t$ . In our work here, we will calculate the interest earned in one year, so  $t$  will be 1.

We modify the column titles in the mixture table to show the formula for interest, as you'll see in Example 4.5.5.

### Example 4.5.5

Translate to a system of equations and solve:

Adnan has \$40,000 to invest and hopes to earn 7.1 interest per year. He will put some of the money into a stock fund that earns 8 per year and the rest into bonds that earns 3 per year. How much money should he put into each fund?

#### Solution

##### Step 1: Read the problem.

A chart will help us organize the information.

##### Step 2: Identify what we are looking for.

We are looking for the amount to invest in each fund.

##### Step 3: Name what we are looking for.

Let  $s$  = the amount invested in stocks.

Let  $b$  = the amount invested in bonds.

Write the interest rate as a decimal for each fund. Multiply: Principal  $\times$  Rate  $\times$  Time to get the Interest.

Account	Principal $\times$ Rate $\times$ Time = Interest			
Stock Fund	$s$	0.08	1	$0.08s$
Bonds	$b$	0.03	1	$0.03b$
Total	40,000	0.071		$0.071(40,000)$

**Step 4: Translate into a system of equations.**

We get our system of equations from the Principal column and the Interest column.

$$\begin{cases} s + b = 40,000 \\ 0.08s + 0.03b = 0.071(40,000) \end{cases}$$

**Step 5: Solve the system of equations.**

Solve by elimination. Multiply the top equation by  $-0.03$ .

$$\begin{cases} -0.03(s + b) = -0.03(40,000) \\ 0.08s + 0.03b = 2,840 \end{cases}$$

$$s = 32,800$$

Simplify and add to solve for  $s$ .

$$\begin{array}{r} \begin{cases} -0.03s - 0.03b = -1,200 \\ 0.08s + 0.03b = 2,840 \end{cases} \\ \hline 0.05s = 1,640 \end{array}$$

To find  $b$ , substitute  $s = 32,800$  into the first equation.

$$\begin{aligned} s + b &= 40,000 \\ 32,800 + b &= 40,000 \\ b &= 7,200 \end{aligned}$$

**Step 6: Check the answer in the problem.**

We leave the check to you.

**Step 7: Answer the question.**

Adnan should invest \$32,800 in stock and \$7,200 in bonds.

Did you notice that the Principal column represents the total amount of money invested while the Interest column represents only the interest earned? Likewise, the first equation in our system,  $s + b = 40,000$ , represents the total amount of money invested and the second equation,  $0.08s + 0.03b = 0.071(40,000)$ , represents the interest earned.

## Try It

12) *Translate to a system of equations and solve:* Leon had \$50,000 to invest and hopes to earn 6.2 interest per year. He will put some of the money into a stock fund that earns 7 per year and the rest in to a savings account that earns 2 per year. How much money should he put into each fund?

### Solution

Leon should put \$42,000 in the stock fund and \$8000 in the savings account.

13) *Translate to a system of equations and solve:* Julius invested \$7,000 into two stock investments. One stock paid 11 interest and the other stock paid 13 interest. He earned 12.5 interest on the total investment. How much money did he put in each stock?

### Solution

Julius invested \$1,750 at 11 and \$5,250 at 13.

## Example 4.5.6

*Translate to a system of equations and solve:* Rosie owes \$21,540 on her two student loans. The interest rate on her bank loan is 10.5 and the interest rate on the federal loan is 5.9. The total amount of interest she paid last year was \$1,669.68. What was the principal for each loan?

### Solution

#### Step 1: Read the problem.

A chart will help us organize the information.

#### Step 2: Identify what we are looking for.

We are looking for the principal of each loan.

**Step 3: Name what we are looking for.**

Let  $b$  = the principal for the bank loan.

Let  $f$  = the principal on the federal loan.

The total loans are \$21,540.

Record the interest rates as decimals in the chart.

Account	Principal $\times$ Rate $\times$ Time = Interest			
Bank	$b$	0.105	1	$0.105b$
Federal	$f$	0.059	1	$0.059f$
Total	21,540			1,669.68

Multiply using the formula  $I = Prt$  to get the Interest.

**Step 4: Translate into a system of equations.**

The system of equations comes from the Principal column and the Interest column.

$$\begin{cases} b + f = 21,540 \\ 0.105b + 0.059f = 1,669.68 \end{cases}$$

**Step 5: Solve the system of equations.**

We will use substitution to solve. Solve the first equation for  $b$ .

$$\begin{aligned} b + f &= 21,540 \\ b &= -f + 21,540 \end{aligned}$$

Substitute  $b = -f + 21,540$  into the second equation.

$$\begin{aligned} 0.105b + 0.059f &= 1,669.68 \\ 0.105(-f + 21,540) + 0.059f &= 1,669.68 \end{aligned}$$

Simplify and solve for  $f$ .

$$\begin{aligned} -0.105f + 2,261.70 + 0.059f &= 1,669.68 \\ -0.46f + 2,261.70 &= 1,669.68 \\ -0.46f &= -592.02 \\ f &= 12,870 \end{aligned}$$

To find  $b$ , substitute  $f = 12,870$  into the first equation.

$$\begin{aligned} b + f &= 21,540 \\ 12,870 + f &= 21,540 \\ f &= 8,670 \end{aligned}$$

**Step 6: Check the answer in the problem.**

We leave the check to you.

**Step 7: Answer the question.**

The principal of the bank loan is \$12,870 and the principal for the federal loan is \$8,670.

## Try It

14) *Translate to a system of equations and solve:* Laura owes \$18,000 on her student loans. The interest rate on the bank loan is 2.5 and the interest rate on the federal loan is 6.9. The total amount of interest she paid last year was \$1,066. What was the principal for each loan?

### Solution

The principal amount for the bank loan was \$4,000. The principal amount for the federal loan was \$14,000.

15) *Translate to a system of equations and solve:* Jill's Sandwich Shoppe owes \$65,200 on two business loans, one at 4.5 interest and the other at 7.2 interest. The total amount of interest owed last year was \$3,582. What was the principal for each loan?

### Solution

The principal amount for was \$41,200 at 4.5. The principal amount was, \$24,000 at 7.2.

# UNIT 5: INTRODUCTION TO POLYNOMIALS

## Chapter Outline

[5.0 Introduction](#)

[5.1 Add and Subtract Polynomials](#)

[5.2 Use Multiplication Properties of Exponents](#)

[5.3 Multiply Polynomials](#)

[5.4 Special Products](#)

[5.5 Divide Monomials](#)

[5.6 Divide Polynomials](#)

[5.7 Introduction to Graphing Polynomials](#)

[5.8 Unit Sources](#)

## 5.0 INTRODUCTION

---

Architects use polynomials to design curved shapes such as this bridge, the Blues Point Bridge, in Sydney NSW, Australia.

Figure 5.0.1: Blues Point Bridge, Sydney NSW, Australia [Photo by Robert Cutts](#) [CC-BY-SA 2.0](#)

We have seen that the graphs of linear equations are straight lines. Graphs of other types of equations, called polynomial equations, are curves, like the outline of this suspension bridge. Architects use polynomials to design the shape of a bridge like this and to draw the blueprints for it. Engineers use polynomials to calculate the stress on the bridge's supports to ensure they are strong enough for the intended load. In this chapter, you will explore operations with and properties of polynomials.

## 5.1 ADD AND SUBTRACT POLYNOMIALS

---

### Learning Objectives

By the end of this section, you will be able to:

- Identify polynomials, monomials, binomials, and trinomials
- Determine the degree of polynomials
- Add and subtract monomials
- Add and subtract polynomials
- Evaluate a polynomial for a given value

### Try it

Before you get started, take this readiness quiz:

- 1) Simplify:  $8x + 3x$ .
- 2) Subtract:  $(5n + 8) - (2n - 1)$
- 3) Write in expanded form:  $a^5$ .

### Identify Polynomials, Monomials, binomial and Trinomials

You have learned that a **term** is a constant or the product of a constant and one or more variables. When it is

of the form  $ax^m$ , where  $a$  is a constant and  $m$  is a whole number, it is called a **monomial**. Some examples of monomial are  $8$ ,  $-2x^2$ ,  $4y^3$ , and  $11z^7$ .

A monomial, or two or more monomials combined by addition or subtraction, is a **polynomial**. Some polynomials have special names, based on the number of terms. A monomial is a polynomial with exactly one term. A **binomial** has exactly two terms, and a **trinomial** has exactly three terms. There are no special names for polynomials with more than three terms.

## Polynomials

**Monomial**—A monomial is a term of the form  $ax^m$ , where  $a$  is a constant and  $m$  is a positive whole number.

**Polynomial**—A monomial, or two or more monomials combined by addition or subtraction, is a polynomial.

- **monomial**—A polynomial with exactly one term is called a monomial.
- **binomial**—A polynomial with exactly two terms is called a binomial.
- **trinomial**—A polynomial with exactly three terms is called a trinomial.

Here are some examples of polynomials.

<b>Polynomial</b>	$b + 1$	$4y^2 - 7y + 2$	$4x^4 + x^3 + 8x^2 - 9x + 1$	
<b>Monomial</b>	$14$	$8y^2$	$-9x^3y^5$	$-13$
<b>Binomial</b>	$a + 7$	$4b - 5$	$y^2 - 16$	$3x^3 - 9x^2$
<b>Trinomial</b>	$x^2 - 7x + 12$	$9y^2 + 2y - 8$	$6m^4 - m^3 + 8m$	$z^4 + 3z^2 - 1$

Notice that every monomial, binomial, and trinomial is also a polynomial. They are just special members of the “family” of polynomials and so they have special names. We use the words *monomial*, *binomial*, and *trinomial* when referring to these special polynomials and just call all the rest *polynomials*.

### Example 5.1.1

Determine whether each polynomial is a monomial, binomial, trinomial, or other polynomial.

- a.  $4y^2 - 8y - 6$
- b.  $-5a^4b^2$
- c.  $2x^5 - 5x^3 - 9x^2 + 3x + 4$
- d.  $13 - 5m^3$
- e.  $q$

**Solution**

	Polynomial	Number of terms	Type
a.	$4y^2 - 8y - 6$	3	Trinomial
b.	$-5a^4b^2$	1	Monomial
c.	$2x^5 - 5x^3 - 9x^2 + 3x + 4$	5	Polynomial
d.	$13 - 5m^3$	2	Binomial
e.	$q$	1	Monomial

### Try It

4) Determine whether each polynomial is a monomial, binomial, trinomial, or other polynomial:

- a.  $5b$
- b.  $8y^3 - 7y^2 - y - 3$
- c.  $-3x^2 - 5x + 9$

d.  $81 - 4a^2$

e.  $-5x^6$

**Solution**

- a. monomial
- b. polynomial
- c. trinomial
- d. binomial
- e. monomial

5) Determine whether each polynomial is a monomial, binomial, trinomial, or other polynomial:

a.  $27z^3 - 8$

b.  $12m^3 - 5m^2 - 2m$

c.  $\frac{5}{6}$

d.  $8x^4 - 7x^2 - 6x - 5$

e.  $-n^4$

**Solution**

- a. binomial
- b. trinomial
- c. monomial
- d. polynomial
- e. monomial

## Determine the Degree of Polynomials

The **degree of a polynomial** and the degree of its terms are determined by the exponents of the variable.

A monomial that has no variable, just a constant, is a special case. The **degree of a constant** is 0—it has no variable.

### Degree of a Polynomial

The **degree of a term** is the sum of the exponents of its variables.

The degree of a constant is 0.

The degree of a polynomial is the highest degree of all its terms.

Let's see how this works by looking at several polynomials. We'll take it step by step, starting with monomials, and then progressing to polynomials with more terms.

Monomial	14			$8y^2$			$-9x^3y^5$			$-13a$		
Degree	0			2			8			1		
Binomial	$a + 7$			$4b^2 - 5b$			$x^2y^2 - 16$			$3n^3 - 9n^2$		
Degree of each term	1	0		2	1		4	0		3	2	
Degree of polynomial	1			2			4			3		
Trinomial	$x^2 - 7x + 12$			$9a^2 + 6ab + b^2$			$6m^4 - m^3n^2 + 8mn^5$			$z^4 + 3z^2 - 1$		
Degree of each term	2	1	0	2	2	2	4	5	6	4	2	0
Degree of polynomial	2			2			6			4		
Polynomial	$b + 1$			$4y^2 - 7y + 2$			$4x^4 + x^3 + 8x^2 - 9x + 1$					
Degree of each term	1	0		2	1	0	4	3	2	1	0	
Degree of polynomial	1			2			4					

A polynomial is in **standard form** when the terms of a polynomial are written in descending order of degrees. Get in the habit of writing the term with the highest degree first.

### Example 5.1.2

Find the degree of the following polynomials.

- $10y$
- $4x^3 - 7x + 5$
- $-15$
- $-8b^2 + 9b - 2$
- $8xy^2 + 2y$

**Solution**

a. The exponent of  $y$  is one.  $y = y^1$

$$10y$$

The degree is **1**.

---

b. The highest degree of all the terms is **3**.

$$4x^3 - 7x + 5$$

The degree is **3**.

---

c. The degree of a constant is **0**.

$$-15$$

The degree is **0**.

---

d. The highest degree of all the terms is **2**.

$$-8b^2 + 9b - 2$$

The degree is **2**.

---

e. The highest degree of all the terms is **3**.

$$6m^4 - m^3 + 8m$$

The degree is **3**.

**Try It**

6) Find the degree of the following polynomials:

- a.  $-15b$
- b.  $10z^4 + 4z^2 - 5$
- c.  $12c^5d^4 + 9c^3d^9 - 7$
- d.  $3x^2y - 4x$
- e.  $-9$

**Solution**

- a. 1
- b. 4
- c. 12
- d. 3
- e. 0

7) Find the degree of the following polynomials:

- a. **52**
- b.  $a^4b - 17a^4$
- c.  $5x + 6y + 2z$
- d.  $3x^2 - 5x + 7$
- e.  $-a^3$

**Solution**

- a. 0
- b. 5
- c. 1
- d. 2
- e. 3

## Add and Subtract Monomials

You have learned how to simplify expressions by combining like terms. Remember, like terms must have the same variables with the same exponent. Since monomials are terms, adding and subtracting monomials is the same as combining like terms. If the monomials are like terms, we just combine them by adding or subtracting the coefficient.

**Example 5.1.3**

Add:  $25y^2 + 15y^2$ .

**Solution**

**Step 1: Combine like terms.**

$$40y^2$$

**Try It**

8) Add:  $12q^2 + 9q^2$ .

**Solution**

$$21q^2$$

9) Add:  $-15c^2 + 8c^2$ .

**Solution**

$$-7c^2$$

**Example 5.1.4**

Subtract:  $16p - (-7p)$

**Solution**

**Step 1: Combine like terms.**

$$23p$$

## Try It

10) Subtract:  $8m - (-5m)$

**Solution**

$$13m$$

11) Subtract:  $-15z^3 - (-5z^3)$

**Solution**

$$-10z^3$$

Remember that like terms must have the same variables with the same exponents.

## Example 5.1.5

Simplify:  $c^2 + 7d^2 - 6c^2$

**Solution**

**Step 1: Combine like terms.**

$$-5c^2 + 7d^2$$

## Try It

12) Add:  $8y^2 + 3z^2 - 3y^2$ .

**Solution**

$$5y^2 + 3z^2$$

13) Add:  $3m^2 + n^2 - 7m^2$

**Solution**

$$-4m^2 + n^2$$

## Example 5.1.6

Simplify:  $u^2v + 5u^2 - 3v^2$

**Solution**

**Step 1:** There are no like terms to combine.

$$u^2v + 5u^2 - 3v^2$$

## Try It

14) Simplify:  $m^2n^2 - 8m^2 + 4n^2$

**Solution**

There are no like terms to combine.

15) Simplify:  $pq^2 - 6p - 5q^2$

**Solution**

There are no like terms to combine.

## Add and Subtract Polynomials

We can think of adding and subtracting polynomials as just adding and subtracting a series of monomials. Look for the like terms—those with the same variables and the same exponent. The Commutative Property allows us to rearrange the terms to put like terms together.

### Example 5.1.7

Find the sum:  $(5y^2 - 3y + 15) + (3y^2 - 4y - 11)$

**Solution**

**Step 1: Identify like terms.**

$$(5y^2 - 3y + 15) + (3y^2 - 4y - 11)$$

**Step 2: Rearrange to get the like terms together.**

$$5y^2 + 3y^2 - 3y - 4y + 15 - 11$$

**Step 3: Combine like terms.**

$$8y^2 - 7y + 4$$

## Try It

16) Find the sum:  $(7x^2 - 4x + 5) + (x^2 - 7x + 3)$

**Solution**

$$8x^2 - 11x + 8$$

17) Find the sum:  $(14y^2 + 6y - 4) + (3y^2 + 8y + 5)$

**Solution**

$$17y^2 + 14y + 1$$

## Example 5.1.8

Find the difference:  $(9w^2 - 7w + 5) - (2w^2 - 4)$

**Solution**

**Step 1: Distribute and identify like terms.**

$$9w^2 - 7w + 5 - 2w^2 + 4$$

**Step 2: Rearrange the terms.**

$$9w^2 - 2w^2 - 7w + 5 + 4$$

**Step 3: Combine like terms.**

$$7w^2 - 7w + 9$$

## Try It

18) Find the difference:  $(8x^2 + 3x - 19) - (7x^2 - 14)$

**Solution**

$$15x^2 + 3x - 5$$

19) Find the difference:  $(9b^2 - 5b - 4) - (3b^2 - 5b - 7)$

**Solution**

$$6b^2 + 3$$

## Example 5.1.9

Subtract:  $(c^2 - 4c + 7)$  from  $(7c^2 - 5c + 3)$ .

**Solution**

**Step 1: Write the equation.**

$$(7c^2 - 5c + 3) - (c^2 - 4c + 7)$$

**Step 2: Distribute and identify like terms.**

$$7c^2 - 5c + 3 - c^2 + 4c - 7$$

**Step 2: Rearrange the terms.**

$$7c^2 - c^2 - 5c + 4c + 3 + 7$$

**Step 3: Combine like terms.**

$$6c^2 - c - 4$$

## Try It

20) Subtract:  $(5z^2 - 6z - 2)$  from  $(7z^2 + 6z - 4)$ .

**Solution**

$$2z^2 + 12z - 2$$

21) Subtract:  $(x^2 - 5x - 8)$  from  $(6x^2 + 9x - 1)$ .

**Solution**

$$5x^2 + 14x + 7$$

## Example 5.1.10

Find the sum:  $(u^2 - 6uv + 5v^2) + (3u^2 + 2uv)$

**Solution**

**Step 1: Distribute.**

$$u^2 - 6uv + 5v^2 + 3u^2 + 2uv$$

**Step 2: Rearrange the terms, to put like terms together.**

$$u^2 + 3u^2 - 6uv + 2uv + 5v^2$$

**Step 3: Combine like terms.**

$$4u^2 - 4uv + 5v^2$$

## Try It

22) Find the sum:  $(3x^2 - 4xy + 5y^2) + (2x^2 - xy)$ .

**Solution**

$$5x^2 - 5xy + 5y^2$$

23) Find the sum:  $(2x^2 - 3xy - 2y^2) + (5x^2 - 3xy)$ .

**Solution**

$$7x^2 - 6xy - 2y^2$$

## Example 5.1.11

Find the difference:  $(p^2 + q^2) - (p^2 + 10pq - 2q^2)$ .

**Solution**

**Step 1: Distribute.**

$$p^2 + q^2 - p^2 - 10pq + 2q^2$$

**Step 2: Rearrange the terms, to put like terms together.**

$$p^2 - p^2 - 10pq + q^2 + 2q^2$$

**Step 3: Combine like terms.**

$$-10pq + 3q^2$$

## Try It

24) Find the difference:  $(a^2 + b^2) - (a^2 + 5ab - 6b^2)$ .

**Solution**

$$-5ab - 5b^2$$

25) Find the difference:  $(m^2 + n^2) - (m^2 - 7mn - 3n^2)$ .

**Solution**

$$4n^2 + 7mn$$

## Example 5.1.12

Simplify:  $(a^3 - a^2b) - (ab^2 + b^3) + (a^2b + ab^2)$ .

**Solution**

**Step 1: Distribute.**

$$a^3 - a^2b - ab^2 - b^3 + a^2b + ab^2$$

**Step 2: Rearrange the terms, to put like terms together.**

$$a^3 - a^2b + a^2b - ab^2 + ab^2 - b^3$$

**Step 3: Combine like terms.**

$$a^3 - b^3$$

## Try It

26) Simplify:  $(x^3 - x^2y) - (xy^2 + y^3) + (x^2y + xy^2)$ .

**Solution**

$$x^3 - y^3$$

27) Simplify:  $(p^3 - p^2q) + (pq^2 + q^3) - (p^2q + pq^2)$ .

**Solution**

$$p^3 - 2p^2q + q^3$$

## Evaluate a Polynomial for a Given Value

We have already learned how to evaluate expressions. Since polynomials are expressions, we'll follow the same procedures to evaluate a polynomial. We will substitute the given value for the variable and then simplify using the order of operations.

### Example 5.1.13

Evaluate  $5x^2 - 8x + 4$  when

- a.  $x = 4$
- b.  $x = -2$
- c.  $x = 0$

**Solution**

a.

**Step 1: Substitute 4 for  $x$ .**

$$5(4)^2 - 8(4) + 4$$

**Step 2: Simplify the exponents.**

$$5 \cdot 16 - 8(4) + 4$$

**Step 3: Multiply.**

$$80 - 32 + 4$$

**Step 4: Simplify.**

$$52$$

---

b.

**Step 1: Substitute  $-2$  for  $x$ .**

$$5(-2)^2 - 8(-2) + 4$$

**Step 2: Simplify the exponents.**

$$5 \cdot 4 - 8(-2) + 4$$

**Step 3: Multiply.**

$$20 + 16 + 4$$

**Step 4: Simplify.**

$$40$$

---

c.

**Step 1: Substitute  $0$  for  $x$ .**

$$5(0)^2 - 8(0) + 4$$

**Step 2: Simplify the exponents.**

$$5 \cdot 0 - 8(0) + 4$$

**Step 3: Multiply.**

$$0 + 0 + 4$$

**Step 4: Simplify.**

$$4$$

## Try It

28) Evaluate:  $3x^2 + 2x - 15$  when

- a.  $x = 3$
- b.  $x = -5$
- c.  $x = 0$

### Solution

- a. 18
- b. 50
- c. -15

29) Evaluate:  $5z^2 - z - 4$  when

- a.  $z = -2$
- b.  $z = 0$
- c.  $z = 2$

### Solution

- a. 18
- b. -4
- c. 14

## Example 5.1.14

The polynomial  $-16t^2 + 250$  gives the height of a ball  $t$  seconds after it is dropped from a 250 foot tall building. Find the height after  $t = 2$  seconds.

### Solution

**Step 1: Substitute  $t = 2$ .**

$$-16(2)^2 + 250$$

**Step 2: Simplify.**

$$\begin{aligned} & -16 \times 4 + 250 \\ \text{Simplify. } & -64 + 250 \\ & = 186 \end{aligned}$$

After **2** seconds the height of the ball is **186** feet.

## Try It

30) The polynomial  $-16t^2 + 250$  gives the height of a ball  $t$  seconds after it is dropped from a 250-foot tall building. Find the height after  $t = 0$  seconds.

**Solution**

250

31) The polynomial  $-16t^2 + 250$  gives the height of a ball  $t$  seconds after it is dropped from a 250-foot tall building. Find the height after  $t = 3$  seconds.

**Solution**

106

## Example 5.1.15

The polynomial  $6x^2 + 15xy$  gives the cost, in dollars, of producing a rectangular container whose top and bottom are squares with side  $x$  feet and sides of height  $y$  feet. Find the cost of producing a box with  $x = 4$  feet and  $y = 6$  feet.

**Solution****Step 1: Substitute**  $x = 4, y = 6$ .

$$6(\textcolor{red}{4})^2 + 15(\textcolor{red}{4})(\textcolor{blue}{6})$$

**Step 2: Simplify.**

$$6 \cdot 16 + 15(\textcolor{red}{4})(\textcolor{blue}{6})$$

$$\begin{aligned} \text{Simplify. } & 96 + 360 \\ & = 456 \end{aligned}$$

The cost of producing the box is **\$456**.**Try It**

32) The polynomial  $6x^2 + 15xy$  gives the cost, in dollars, of producing a rectangular container whose top and bottom are squares with side  $x$  feet and sides of height  $y$  feet. Find the cost of producing a box with  $x = 6$  feet and  $y = 4$  feet.

**Solution**

\$576

33) The polynomial  $6x^2 + 15xy$  gives the cost, in dollars, of producing a rectangular container whose top and bottom are squares with side  $x$  feet and sides of height  $y$  feet. Find the cost of producing a box with  $x = 5$  feet and  $y = 8$  feet.

**Solution**

\$750

Access these online resources for additional instruction and practice with adding and subtracting polynomials.

- [Add and Subtract Polynomials 1](#)
- [Add and Subtract Polynomial 2](#)
- [Add and Subtract Polynomial 3](#)

## Key Concepts

- **Monomials**

- A monomial is a term of the form  $ax^m$ , where  $a$  is a constant and  $m$  is a whole number.

- **Polynomials**

- **polynomial**—A monomial, or two or more monomials combined by addition or subtraction is a polynomial.
- **monomial**—A polynomial with exactly one term is called a monomial.
- **binomial**—A polynomial with exactly two terms is called a binomial.
- **trinomial**—A polynomial with exactly three terms is called a trinomial.

- **Degree of a Polynomial**

- The **degree of a term** is the sum of the exponents of its variables.
- The **degree of a constant** is 0.
- The **degree of a polynomial** is the highest degree of all its terms.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=2618#h5p-26>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## Glossary

### binomial

A binomial is a polynomial with exactly two terms.

### degree of a constant

The degree of any constant is 0.

### degree of a polynomial

The degree of a polynomial is the highest degree of all its terms.

### degree of a term

The degree of a term is the exponent of its variable.

### monomial

A monomial is a term of the form  $ax^m$ , where  $a$  is a constant and  $m$  is a whole number; a monomial has exactly one term.

### polynomial

A polynomial is a monomial, or two or more monomials combined by addition or subtraction.

**standard form**

A polynomial is in standard form when the terms of a polynomial are written in descending order of degrees.

**trinomial**

A trinomial is a polynomial with exactly three terms.

## 5.2 USE MULTIPLICATION PROPERTIES OF EXPONENTS

### Learning Objectives

By the end of this section, you will be able to:

- Simplify expressions with exponents
- Simplify expressions using the Product Property for Exponents
- Simplify expressions using the Power Property for Exponents
- Simplify expressions using the Product to a Power Property
- Simplify expressions by applying several properties
- Multiply monomials

### Try it

Before you get started, take this readiness quiz:

- 1) Simplify:  $\frac{3}{4} \times \frac{3}{4}$
- 2) Simplify:  $(-2)(-2)(-2)$ .
- 3) What is the place value of the **6** in the number **64, 891**?
- 4) Name the decimal: **0.0012**.
- 5) Subtract:  $5 - (-3)$ .

## Simplify Expressions with Exponents

Remember that an exponent indicates repeated multiplication of the same quantity. For example,  $2^4$  means to multiply 2 by itself 4 times, so  $2^4$  means  $2 \cdot 2 \cdot 2 \cdot 2$ .

Let's review the vocabulary for expressions with exponents.

### Exponential Notation

$$\begin{array}{c} a^m \leftarrow \text{exponent} \\ \uparrow \\ \text{base} \end{array}$$

$a^m$  means multiply  $m$  factors of  $a$

$$a^m = \underbrace{a \cdot a \cdot a \cdot \dots \cdot a}_{m \text{ factors}}$$

This is read  $a$  to the  $m^{\text{th}}$  power.

In the expression  $a^m$ , the *exponent*  $m$  tells us how many times we use the *base*  $a$  as a factor.

$$\begin{array}{cc} 4^3 & (-9)^5 \\ \underbrace{4 \cdot 4 \cdot 4}_{3 \text{ factors}} & \underbrace{(-9)(-9)(-9)(-9)(-9)}_{5 \text{ factors}} \end{array}$$

Before we begin working with variable expressions containing exponents, let's simplify a few expressions involving only numbers.

#### Example 5.2.1

Simplify:

- a.  $4^3$
- b.  $7^1$
- c.  $\left(\frac{5}{6}\right)^2$
- d.  $(0.63)^2$

**Solution**

a.

**Step 1: Multiply three factors of 4.**

$$4 \times 4 \times 4$$

Simplify. 64

---

b.

**Step 1: Multiply one factor of 7.**

$$7$$

---

c.

**Step 1: Multiply two factors.**

$$\left(\frac{5}{6}\right) \times \left(\frac{5}{6}\right)$$

Simplify.  $\frac{25}{36}$

---

d.

**Step 1: Multiply two factors.**

$$(0.63) \times (0.63)$$

Simplify. 0.3969

## Try It

6) Simplify:

a.  $6^3$

b.  $15^1$

c.  $(\frac{3}{7})^2$

d.  $(0.43)^2$

**Solution**

a. 216

b. 15

c.  $\frac{9}{49}$

d. 0.1849

7) Simplify:

a.  $2^5$

b.  $21^1$

c.  $(\frac{2}{5})^3$

d.  $(0.218)^2$

**Solution**

a. 32

b. 21

c.  $\frac{8}{125}$

d. 0.047524

**Example 5.2.2**

Simplify:

a.  $(-5)^4$

b.  $-5^4$

**Solution**

a.

**Step 1: Multiply four factors of  $-5$ .**

$$\begin{array}{r} (-5)(-5)(-5)(-5) \\ \text{Simplify. } 625 \end{array}$$

---

b.

**Step 1: Multiply four factors of  $5$ .**

$$\begin{array}{r} -(5 \times 5 \times 5 \times 5) \\ \text{Simplify. } 6 - 25 \end{array}$$

## Try It

8) Simplify:

a.  $(-3)^4$

b.  $-3^4$

**Solution**

a. 81

b.  $-81$

9) Simplify:

a.  $(-13)^2$

b.  $-13^2$

**Solution**

a. 169

b.  $-169$

Notice the similarities and differences in the “Example 5.2.2” a. and b.! Why are the answers different? As we

follow the order of operations in part a. the parentheses tell us to raise the  $-5$  to the  $4^{th}$  power. In part b. we raise just the  $5$  to the  $4^{th}$  power and then take the opposite.

## Simplify Expressions Using the Product Property for Exponents

You have seen that when you combine like terms by adding and subtracting, you need to have the same base with the same exponent. But when you multiply and divide, the exponents may be different, and sometimes the bases may be different, too.

We'll derive the properties of exponents by looking for patterns in several examples.

First, we will look at an example that leads to the Product Property.

	$x^2 \cdot x^3$
What does this mean?	$\underbrace{x \cdot x}_{2 \text{ factors}} \cdot \underbrace{x \cdot x \cdot x}_{3 \text{ factors}}$
How many factors altogether?	$\underbrace{\hspace{10em}}_{5 \text{ factors}}$
So, we have	$x^5$
Notice that <b>5</b> is the sum of the exponents, <b>2</b> and <b>3</b> .	$x^2 \cdot x^3$ is $x^{2+3}$ , or $x^5$

We write:

$$\begin{aligned} x^2 \cdot x^3 \\ x^{2+3} \\ x^5 \end{aligned}$$

The base stayed the same and we added the exponents. This leads to the Product Property for Exponents.

### Product Property for Exponents

If  $a$  is a real number, and  $m$  and  $n$  are counting numbers, then

$$a^m \times a^n = a^{m+n}$$

To multiply with like bases, add the exponents.

An example with numbers helps to verify this property:

$$\begin{aligned} 2^2 \times 2^3 &\stackrel{?}{=} 2^{2+3} \\ 4 \times 8 &\stackrel{?}{=} 2^5 \\ 32 &= 32 \end{aligned}$$

### Example 5.2.3

Simplify:  $y^5 \times y^6$

**Solution**

**Step 1:** Use the product property,  $a^m \cdot a^n = a^{m+n}$

$$\begin{aligned} &y^{5+6} \\ \text{Simplify. } &y^{11} \end{aligned}$$

### Try It

10) Simplify:  $b^9 \times b^8$

**Solution**

$$b^{17}$$

11) Simplify:  $x^{12} \times x^4$ .

**Solution**

$$x^{16}$$

### Example 5.2.4

Simplify:

a.  $2^5 \times 2^9$

b.  $3 \times 3^4$

**Solution**

a.

**Step 1:** Use the product property,  $a^m \cdot a^n = a^{m+n}$

$$2^{5+9}$$

Simplify.  $2^{14}$

---

b.

**Step 1:** Use the product property,  $a^m \cdot a^n = a^{m+n}$

$$3^{1+4}$$

Simplify.  $3^5$

### Try It

12) Simplify:

a.  $5 \times 5^5$

b.  $4^9 \times 4^9$

**Solution**

a.  $5^6$

b.  $4^{18}$

13) Simplify:

a.  $7^6 \times 7^8$

b.  $10 \times 10^{10}$ .

**Solution**

a.  $7^{14}$

b.  $10^{11}$

**Example 5.2.5**

Simplify:

a.  $a^7 \times a$

b.  $x^{27} \times x^{13}$

**Solution**

a.

**Step 1: Rewrite,  $a = a^1$ .**

$$a^7 \times a^1$$

**Step 2: Use the product property,  $a^m \cdot a^n = a^{m+n}$** 

$$3a^{7+1}$$

Simplify.  $a^8$

b.

**Step 1: Notice, the bases are the same, so add the exponents.**

Simplify.  $x^{27+13}$   
 $x^{40}$

## Try It

14) Simplify:

a.  $p^5 \times p$

b.  $y^{14} \times y^{29}$

**Solution**

a.  $p^6$

b.  $y^{43}$

15) Simplify:

a.  $z \times z^7$

b.  $b^{15} \times b^{34}$ .

**Solution**

a.  $z^8$

b.  $b^{49}$

We can extend the Product Property for Exponents to more than two factors.

**Example 5.2.6**Simplify:  $d^4 \cdot d^5 \cdot d^2$ **Solution****Step 1:** Add the exponents, since bases are the same.

$$\text{Simplify. } d^{4+5+2}$$

$$d^{11}$$

**Try It**16) Simplify:  $x^6 \times x^4 \times x^8$ **Solution**

$$x^{18}$$

17) Simplify:  $b^5 \times b^9 \times b^5$ **Solution**

$$b^{19}$$

## Simplify Expressions Using the Power Property for Exponents

Now let's look at an exponential expression that contains a power raised to a power. See if you can discover a general property.

$$(x^2)^3$$

What does  
this mean?

How  
many  
factors  
altogether?

$$\begin{array}{ccccccc} x^2 & \cdot & x^2 & \cdot & x^2 \\ \underbrace{x \cdot x}_{2 \text{ factors}} & \cdot & \underbrace{x \cdot x}_{2 \text{ factors}} & \cdot & \underbrace{x \cdot x}_{2 \text{ factors}} \\ \underbrace{\hspace{10em}}_{6 \text{ factors}} \end{array}$$

So, we  
have  $x^6$

Notice  
that 6 is  
the  
product of  $(x^2)^3$  is  $x^{2 \cdot 3}$  or  $x^6$   
the  
exponents,  
2 and 3.

We write:

$$\begin{aligned} (x^2)^3 \\ x^{(2 \times 3)} \\ x^6 \end{aligned}$$

We multiplied the exponents. This leads to the **Power Property for Exponents**.

### Power Property for Exponents

If  $a$  is a real number, and  $m$  and  $n$  are whole numbers, then

$$(a^m)^n = a^{mn}$$

To raise a power to a power, multiply the exponents.

An example with numbers helps to verify this property:

$$\begin{aligned} (3^2)^3 &\stackrel{?}{=} 3^{(2 \times 3)} \\ (9)^3 &\stackrel{?}{=} 3^6 \\ 729 &= 729 \end{aligned}$$

### Example 5.2.7

Simplify:

a.  $(y^5)^9$

b.  $(4^4)^7$

**Solution**

a.

**Step 1:** Use the power property,  $(a^m)^n = a^{a \cdot n}$

$$\text{Simplify. } y^{5 \times 9} = y^{45}$$

---

b.

**Step 1:** Use the power property.

$$\text{Simplify. } 4^{4 \times 7} = 4^{28}$$

### Try It

18) Simplify:

a.  $(b^7)^5$

b.  $(5^4)^3$

**Solution**

a.  $b^{35}$

b.  $5^{12}$

19) Simplify:

a.  $(z^6)^9$

b.  $(3^7)^7$

**Solution**

a.  $z^{54}$

b.  $3^{49}$

## Simplify Expressions Using the Product to a Power Property

We will now look at an expression containing a product that is raised to a power. Can you find this pattern?

	$(2x)^3$
What does this mean?	$2x \cdot 2x \cdot 2x$
We group the like factors together.	$2 \cdot 2 \cdot 2 \cdot x \cdot x \cdot x$
How many factors of <b>2</b> and of <b><math>x</math></b> ?	$2^3 \times x^3$

Notice that each factor was raised to the power and  $(2x)^3$  is  $2^3 \times x^3$ .

We write:

$$(2x)^3$$

$$2^3 \times x^3$$

The exponent applies to each of the factors! This leads to the Product to a Power Property for Exponents.

## Product to a Power Property for Exponents

If  $a$  and  $b$  are real numbers and  $m$  is a whole number, then

$$(ab)^m = a^m b^m$$

To raise a product to a power, raise each factor to that power.

An example with numbers helps to verify this property:

$$\begin{aligned} 2(2 \times 3)^2 &\stackrel{?}{=} 2^2 3^2 \\ 6^2 &\stackrel{?}{=} (4)(9) \\ 36 &= 36 \end{aligned}$$

### Example 5.2.8

Simplify:

- a.  $(-9d)^2$
- b.  $(3mn)^3$

#### Solution

a.

**Step 1: Use Power of a Product Property,  $(ab)^m = a^m b^m$**

$$(-9)^2 d^2$$

$$\text{Simplify. } 81d^2$$

b.

**Step 1: Use Power of a Product Property,  $(ab)^m = a^m b^m$**

$$(3)^3 m^3 n^3$$

Simplify.  $27m^3n^3$

## Try It

20) Simplify:

a.  $(-12y)^2$

b.  $(2wx)^5$

**Solution**

a.  $144y^2$

b.  $32w^5x^5$

21) Simplify:

a.  $5wx^3$

b.  $(-3y)^3$

**Solution**

a.  $125w^3x^3$

b.  $-27y^3$

## Simplify Expressions by Applying Several Properties

We now have three properties for multiplying expressions with exponents. Let's summarize them and then we'll do some examples that use more than one of the properties.

## Properties of Exponents

If  $a$  and  $b$  are real numbers, and  $m$  and  $n$  are whole numbers, then

<b>Product Property</b>	$a^m \times a^n = a^{m+n}$
<b>Power Property</b>	$(a^m)^n = a^{mn}$
<b>Product to a Power</b>	$(ab)^m = a^m b^m$

All exponent properties hold true for any real numbers  $m$  and  $n$ . Right now, we only use whole-number exponents.

### Example 5.2.9

Simplify:

a.  $(y^3)^6 (y^5)^4$

b.  $(-6x^4y^5)^2$

**Solution**

a.

**Step 1: Use the Power Property.**

$$y^{18} \times y^{20}$$

**Step 2: Add the exponents.**

$$y^{38}$$

---

b.

**Step 1: Use the Product to a Power Property.**

$$(-6)^2(x^4)^2(y^5)^2$$

**Step 2: Use the Power Property.**

$$\begin{array}{l} (-6)^2(x^4)^2(y^5)^2 \\ \text{Simplify. } 36x^8y^{10} \end{array}$$

## Try It

22) Simplify:

a.  $(a^4)^5(a^7)^4$

b.  $(-2c^4d^2)^3$

**Solution**

a.  $a^{48}$

b.  $(-8c^{12}d^6)$

23) Simplify:

a.  $(-3x^6y^7)^4$

b.  $(q^4)^5(q^3)^3$

**Solution**

a.  $81x^{24}y^{28}$

b.  $q^{29}$

## Example 5.2.10

Simplify:

a.  $(5m)^2(3m)^3$

b.  $(3x^2y)^4(2xy^2)^3$

**Solution**

a.

**Step 1: Raise  $5m$  to the second power.**

$$5^2m^2 \times 3m^3$$

Simplify.  $25m^2 \times 3m^3$

**Step 2: Use the Commutative Property.**

$$25 \times 3 \times m^2 \times m^3$$

**Step 3: Multiply the constants and add the exponents.**

$$75m^5$$

---

b.

**Step 1: Use the Product to a Power Property.**

$$(3^4x^8y^4)(2^3x^3y^6)$$

Simplify.  $(81x^8y^4)(8x^3y^6)$

**Step 2: Use the Commutative Property.**

$$81 \times 8 \times x^8 \times x^3 \times y^4 \times y^6$$

**Step 3: Multiply the constants and add the exponents.**

$$648x^{11}y^{10}$$

## Try It

24) Simplify:

a.  $(5n)^2(3n^{10})$

b.  $(c^4d^2)^5(3cd^5)^4$

**Solution**

a.  $75n^{12}$

b.  $81c^{24}d^{30}$

25) Simplify:

a.  $(a^3b^2)^6(4ab^3)^4$

b.  $(2x)^3(5x^7)$

**Solution**

a.  $256a^{22}b^{24}$

b.  $40x^{10}$

## Multiply Monomials

Since a monomial is an algebraic expression, we can use the properties of exponents to multiply monomials.

### Example 5.2.11

Multiply:  $(3x^2)(-4x^3)$

**Solution**

**Step 1:** Use the Commutative Property to rearrange the terms.

$$\begin{array}{r} 3(-4)x^2x^3 \\ \text{Multiply.} \quad -12x^5 \end{array}$$

## Try It

26) Multiply:  $(5y^7)(-7y^4)$

**Solution**

$$-35y^{11}$$

27) Multiply:  $(-6b^4)(-9b^5)$

**Solution**

$$54b^9$$

## Example 5.2.12

Multiply:  $(\frac{5}{6}x^3y)(12xy^2)$

**Solution**

**Step 1:** Use the Commutative Property to rearrange the terms.

$$\begin{array}{r} \frac{5}{6} \times 12x^3xyy^2 \\ \text{Multiply.} \quad 10x^4y^3 \end{array}$$

## Try It

28) Multiply:  $(\frac{2}{5}a^4b^3)(15ab^3)$

**Solution**

$$6a^5b^6$$

29) Multiply:  $(\frac{2}{3}r^5s)(12r^6s^7)$

**Solution**

$$8r^{11}s^8$$

Access these online resources for additional instruction and practice with using multiplication properties of exponents:

- [Multiplication Properties of Exponents](#)

## Key Concepts

- **Exponential Notation**

$$a^{\overbrace{m}^{\text{exponent}}}$$

↑  
base

$a^m$  means multiply  $m$  factors of  $a$

$$a^m = \underbrace{a \cdot a \cdot a \cdot \dots \cdot a}_{m \text{ factors}}$$

### • Properties of Exponents

- If  $a$ , and  $b$  are real numbers and  $m, n$  are whole numbers, then
- Product Property  $a^m a^n = a^{m+n}$
- Power Property  $(a^m)^n = a^{mn}$
- Product to a Power  $(ab)^m = a^m b^m$

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

An interactive H5P element has been excluded from this version of the text. You can view it online here:

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=2663#h5p-27>

After reviewing this checklist, what will you do to become confident for all goals?

## 5.3 MULTIPLY POLYNOMIALS

### Learning Objectives

By the end of this section, you will be able to:

- Multiply a polynomial by a monomial
- Multiply a binomial by a binomial
- Multiply a trinomial by a binomial

### Try it

Before you get started, take this readiness quiz:

- 1) Distribute:  $2(x + 3)$
- 2) Combine like terms:  $x^2 + 9x + 7x + 63$

### Multiply a Polynomial by a Monomial

We have used the Distributive Property to simplify expressions like  $2(x - 3)$ . You multiplied both terms in the parentheses,  $x$  and  $3$  by  $2$ , to get  $2x - 6$ . With this chapter's new vocabulary, you can say you were multiplying a binomial,  $x - 3$ , by a monomial,  $2$ .

Multiplying a binomial by a monomial is nothing new for you! Here's an example:

**Example 5.3.1**

Multiply:  $4(x + 3)$

**Solution**

$$4(x + 3)$$

Figure 5.3.1

**Step 1: Distribute.**

$$4 \times x + 4 \times 3$$

Simplify.  $4x + 12$

**Try It**

3) Multiply:  $5(x + 7)$

**Solution**

$$5x + 35$$

4) Multiply:  $3(y + 13)$

**Solution**

$$3y + 39$$

### Example 5.3.2

Multiply:  $y(y - 2)$

**Solution**

$$y(y - 2)$$

Figure 5.3.2

**Step 1: Distribute.**

$$y \times y - y \times 2$$

Simplify.  $y^2 - 2y$

### Try It

5) Multiply:  $x(x - 7)$

**Solution**

$$x^2 - 7x$$

6) Multiply:  $d(d - 11)$

**Solution**

$$d^2 - 11d$$

### Example 5.3.3

Multiply:  $7x(2x + y)$

**Solution**

$$7x(2x + y)$$

Figure 5.3.3

**Step 1: Distribute.**

$$7x \times 2x + 7x \times y$$

Simplify.  $14x^2 + 7xy$

### Try It

7) Multiply:  $5x(x + 4y)$

**Solution**

$$5x^2 + 20xy$$

8) Multiply:  $2p(6p + r)$

**Solution**

$$12p^2 + 2pr$$

**Example 5.3.4**

Multiply:  $-2y(4y^2 + 3y - 5)$

**Solution**

$$-2y(4y^2 + 3y - 5)$$

Figure 5.3.4

**Step 1: Distribute.**

$$-2y \times 4y^2 + (-2y) \times 3y - (-2y) \times 5$$

Simplify.  $-8y^3 - 6y^2 + 10y$

**Try It**

9) Multiply:  $-3y(5y^2 + 8y - 7)$

**Solution**

$$-15y^3 - 24y^2 + 21y$$

10) Multiply:  $4x^2(2x^2 - 3x + 5)$

**Solution**

$$8x^4 - 12x^3 + 20x^2$$

**Example 5.3.5**

Multiply:  $2x^3(x^2 - 8x + 1)$

**Solution**

$$2x^3(x^2 - 8x + 1)$$

Figure 5.3.5

**Step 1: Distribute.**

$$2x^3 \times x^2 + (2x^3) \times (-8x) + (2x^3) \times 1$$

Simplify.  $2x^5 - 16x^4 + 2x^3$

**Try It**

11) Multiply:  $4x(3x^2 - 5x + 3)$

**Solution**

$$12x^3 - 20x^2 + 12x$$

12) Multiply:  $-6a^3(3a^2 - 2a + 6)$

**Solution**

$$-18a^5 + 12a^4 - 36a^3$$

**Example 5.3.6**

Multiply:  $(x + 3)p$ .

**Solution**

**Step 1:** The monomial is the second factor.

$$(x + 3)p$$

Figure 5.3.6

**Step 2:** Distribute.

$$x \times p + 3 \times p$$

Simplify.  $xp + 3p$

**Try It**

13) Multiply:  $(x + 8)p$

**Solution**

$$xp + 8p$$

14) Multiply:  $(a + 4)p$

**Solution**

$$ap + 4p$$

**Multiply a Binomial by a Binomial**

Just like there are different ways to represent multiplication of numbers, there are several methods that can be used to multiply a binomial times a binomial. We will start by using the Distributive Property.

## Multiply a Binomial by a Binomial Using the Distributive Property

Look at below table, where we multiplied a binomial by a monomial.

	$(x + 3)p$
We distributed the $p$ to get:	$xp + 3p$
What if we have $(x + 7)$ instead of $p$ ?	$(x + 3)(x + 7)$
Distribute $(x + 7)$ .	$x(x + 7) + 3(x + 7)$
Distribute again.	$x^2 + 7x + 3x + 21$
Combine like terms.	$x^2 + 10x + 21$

Notice that before combining like terms, you had four terms. You multiplied the two terms of the first binomial by the two terms of the second binomial—four multiplications.

### Example 5.3.7

Multiply:  $(y + 5)(y + 8)$

**Solution**

$$(y + 5)(y + 8)$$

Figure 5.3.7

**Step 1: Distribute**  $(y + 8)$ .

$$y(y + 8) + 5(y + 8)$$

**Step 2: Distribute again**

$$y^2 + 8y + 5y + 40$$

**Step 3: Combine like terms.**

$$y^2 + 13y + 40$$

## Try It

15) Multiply:  $(x + 8)(x + 9)$

**Solution**

$$x^2 + 17x + 72$$

16) Multiply:  $(5x + 9)(4x + 3)$

**Solution**

$$20x^2 + 51x + 27$$

## Example 5.3.8

Multiply:  $(2y + 5)(3y + 4)$

**Solution**

The diagram shows the expression  $(2y + 5)(3y + 4)$  with red arrows indicating the distributive process. One arrow points from  $2y$  to  $3y$ , another from  $2y$  to  $4$ , a third from  $5$  to  $3y$ , and a fourth from  $5$  to  $4$ .

Figure 5.3.8

**Step 1: Distribute  $(3y + 4)$ .**

$$2y(3y + 4) + 5(3y + 4)$$

**Step 2: Distribute again**

$$6y^2 + 8y + 15y + 20$$

**Step 3: Combine like terms.**

$$6y^2 + 23y + 20$$

## Try It

17) Multiply:  $(3b + 5)(4b + 6)$

**Solution**

$$12b^2 + 38b + 30$$

18) Multiply:  $(a + 10)(a + 7)$

**Solution**

$$a^2 + 17a + 70$$

## Example 5.3.9

Multiply:  $(4y + 3)(2y - 5)$

**Solution**

**Step 1: Distribute.**

$$4y(2y - 5) + 3(2y - 5)$$

**Step 2: Distribute again.**

$$8y^2 - 20y + 6y - 15$$

**Step 3: Combine like terms.**

$$8y^2 - 14y - 15$$

## Try It

19) Multiply:  $(5y + 2)(6y - 3)$

**Solution**

$$30y^2 - 3y - 6$$

20) Multiply:  $(3c + 4)(5c - 2)$

**Solution**

$$15c^2 + 14c - 8$$

## Example 5.3.10

Multiply:  $(x - 2)(x - y)$

**Solution**

The diagram shows the expression  $(x - 2)(x - y)$  with two red curved arrows. One arrow starts from the  $x$  in the first binomial and points to the  $x$  in the second binomial. The other arrow starts from the  $-2$  in the first binomial and points to the  $-y$  in the second binomial, illustrating the distributive property.

Figure 5.3.9

**Step 1: Distribute.**

$$x(x - y) - 2(x - y)$$

**Step 2: Distribute again.**

$$x^2 - xy - 2x + 2y$$

**Step 3: There are no like terms to combine.**

## Try It

21) Multiply:  $(a + 7)(a - b)$

**Solution**

$$a^2 - ab + 7a - 7b$$

22) Multiply:  $(x + 5)(x - y)$

**Solution**

$$x^2 - xy + 5x - 5y$$

## Multiply a Binomial by a Binomial Using the FOIL Method

Remember that when you multiply a binomial by a binomial you get four terms. Sometimes you can combine like terms to get a trinomial, but sometimes, like in the Example 5.3.10 there are no like terms to combine.

Let's look at the last example again and pay particular attention to how we got the four terms.

$$(x - 2)(x - y)$$

$$x^2 - xy - 2x + 2y$$

Where did the first term,  $x^2$ , come from?

It is the product of  $x$  and  $x$ , the *first* terms in  $(x - 2)$  and  $(x - y)$ .

The next term,  $-xy$ , is the product of  $x$  and  $-y$ , the two *outer* terms.

The third term,  $-2x$ , is the product of  $-2$  and  $x$ , the two *inner* terms.

And the last term,  $+2y$ , came from multiplying the two *last* terms,  $-2$  and  $-y$ .

Figure 5.3.10

We abbreviate “First, Outer, Inner, Last” as FOIL. The letters stand for ‘**F**irst, **O**uter, **I**nnner, **L**ast’. The word FOIL is easy to remember and ensures we find all four products.

$$\begin{array}{c} (x - 2)(x - y) \\ x^2 - xy - 2x + 2y \\ \text{F. O. I. L} \end{array}$$

Let’s look at  $(x + 3)(x + 7)$ .

**Distributive Property**

$$(x + 3)(x + 7)$$

$$x(x + 7) + 3(x + 7)$$

$$\begin{array}{cccc} x^2 & + & 7x & + & 3x & + & 21 \\ F & & O & & I & & L \end{array}$$

$$x^2 + 10x + 21$$

**FOIL**

$$(x + 3)(x + 7)$$

Figure 5.3.11

$$\begin{array}{cccc} x^2 & + & 7x & + & 3x & + & 21 \\ F & & O & & I & & L \end{array}$$

$$x^2 + 10x + 21$$

Notice how the terms in third line fit the FOIL pattern.

Now we will do an example where we use the FOIL pattern to multiply two binomials.

**Example 5.3.11**

Multiply using the FOIL method:  $(x + 5)(x + 9)$

**Solution**

**Step 1.** Multiply the *First* terms.

$$(x + 5)(x + 9)$$

$$(x + 5)(x + 9)$$

$$\begin{array}{cccc} x^2 & + & \underline{\quad} & + & \underline{\quad} & + & \underline{\quad} \\ F & & O & & I & & L \end{array}$$

Figure 5.3.12

**Step 2.** Multiply the *Outer* terms.

$$(x + 5)(x + 9)$$

$$(x + 5)(x + 9)$$

$$\begin{array}{cccc} x^2 & + & 9x & + & \underline{\quad} & + & \underline{\quad} \\ F & & O & & I & & L \end{array}$$

Figure 5.3.13

**Step 3.** Multiply the *Inner* terms.

$$(x + 5)(x + 9)$$

$$x^2 + 9x + \underline{5x} + \underline{\quad}$$

F    O    I    L

Figure 5.3.14

**Step 4.** Multiply the *Last* terms.

$$(x + 5)(x + 9)$$

$$x^2 + 9x + 5x + \underline{45}$$

F    O    I    L

Figure 5.3.15

**Step 5.** Combine like terms, when possible.

$$x^2 + 14x + 45$$

Figure 5.3.16

## Try It

23) Multiply using the FOIL method:  $(x + 6)(x + 8)$

**Solution**

$$x^2 + 14x + 48$$

24) Multiply using the FOIL method:  $(y + 17)(y + 3)$

**Solution**

$$y^2 + 20y + 51$$

We summarize the steps of the FOIL method below. The FOIL method only applies to multiplying binomials, not other polynomials!

## Multiply two binomials using the FOIL method

### HOW TO

**Step 1.** Multiply the *First* terms.

**Step 2.** Multiply the *Outer* terms.

**Step 3.** Multiply the *Inner* terms.

**Step 4.** Multiply the *Last* terms.

**Step 5.** Combine like terms, when possible.

$$\begin{array}{ccccccc} \textit{first} & & \textit{last} & & \textit{first} & & \textit{last} \\ ( & a & + & b & ) ( & c & + & d & ) \\ & & & \underbrace{\hspace{1.5cm}}_{\textit{inner}} & & & & \\ & & & \underbrace{\hspace{1.5cm}}_{\textit{outer}} & & & & \end{array}$$

Say it as you multiply!

FOIL

First  
Outer  
Inner  
Last

Figure 5.3.17

When you multiply by the FOIL method, drawing the lines will help your brain focus on the pattern and make it easier to apply.

### Example 5.3.12

Multiply:  $(y - 7)(y + 4)$

**Solution**

		$(y - 7)(y + 4)$	
Multiply the <b>First</b> terms.		$y^2 + \frac{\quad}{O} + \frac{\quad}{I} + \frac{\quad}{L}$	
Multiply the <b>Outer</b> terms.		$y^2 + 4y + \frac{\quad}{O} + \frac{\quad}{L}$	
Multiply the <b>Inner</b> terms.		$y^2 + 4y - 7y + \frac{\quad}{O} + \frac{\quad}{L}$	
Multiply the <b>Last</b> terms.		$y^2 + 4y - 7y - 28$	
Combine like terms.		$y^2 - 3y - 28$	

Figure 5.3.18

## Try It

25) Multiply:  $(x - 7)(x + 5)$

**Solution**

$$x^2 - 2x - 35$$

26) Multiply:  $(b - 3)(b + 6)$

**Solution**

$$b^2 + 3b - 18$$

### Example 5.3.13

Multiply:  $(4x + 3)(2x - 5)$

**Solution**

	$(4x - 3)(2x - 5)$  $(4x + 3)(2x - 5)$
Multiply the <i>First</i> terms, $4x \cdot 2x$ .	$8x^2 + \frac{\quad}{O} + \frac{\quad}{I} + \frac{\quad}{L}$
Multiply the <i>Outer</i> terms, $4x \cdot (-5)$ .	$8x^2 - 20x + \frac{\quad}{I} + \frac{\quad}{L}$
Multiply the <i>Inner</i> terms, $3 \cdot 2x$ .	$8x^2 - 2x + 6x + \frac{\quad}{L}$
Multiply the <i>Last</i> terms, $3 \cdot (-5)$ .	$8x^2 - 20x + 6x - 15$ $F \quad O \quad I \quad L$
Combine like terms.	$8x^2 - 14x - 15$

Figure 5.3.19

### Try It

27) Multiply:  $(3x + 7)(5x - 2)$

**Solution**

$$15x^2 + 29x - 14$$

28) Multiply:  $(4y + 5)(4y - 10)$

**Solution**

$$16y^2 - 20y - 50$$

The final products in the last four examples were trinomials because we could combine the two middle terms. This is not always the case.

### Example 5.3.14

Multiply:  $(3x - y)(2x - 5)$

**Solution**

$$(3x - y)(2x - 5)$$

Figure 5.3.20

**Step 1: Multiply the *First*.**

$$\underset{F}{6x^2} + \underset{O}{\phantom{0}} + \underset{I}{\phantom{0}} + \underset{L}{\phantom{0}}$$

**Step 2: Multiply the *Outer*.**

$$\underset{F}{6x^2} - \underset{O}{15x} + \underset{I}{\phantom{0}} + \underset{L}{\phantom{0}}$$

**Step 3: Multiply the *Inner*.**

$$\underset{F}{6x^2} - \underset{O}{15x} - \underset{I}{2xy} + \underset{L}{\phantom{0}}$$

**Step 4: Multiply the *Last*.**

$$\underset{F}{6x^2} - \underset{O}{15x} - \underset{I}{2xy} + \underset{L}{5y}$$

**Step 5: Combine like terms—there are none.**

$$6x^2 - 15x - 2xy + 5y$$

## Try It

29) Multiply:  $(10c - d)(c - 6)$

**Solution**

$$10c^2 - 60c - cd + 6d$$

30) Multiply:  $(7x - y)(2x - 5)$

**Solution**

$$14x^2 - 35x - 2xy + 10y$$

Be careful of the exponents in the next example.

## Example 5.3.15

Multiply:  $(n^2 + 4)(n - 1)$

**Solution**

The diagram shows the expression  $(n^2 + 4)(n - 1)$  with red curved arrows indicating the distributive property. One arrow starts from  $n^2$  and points to  $n$ , and another starts from  $n^2$  and points to  $-1$ . Similarly, a third arrow starts from  $4$  and points to  $n$ , and a fourth starts from  $4$  and points to  $-1$ .

Figure 5.3.21

**Step 1: Multiply the First.**

$$\overset{\textcolor{red}{n^3}}{F} + \frac{\phantom{n^3}}{O} + \frac{\phantom{n^3}}{I} + \frac{\phantom{n^3}}{L}$$

**Step 2: Multiply the *Outer*.**

$$\overset{n^3}{F} - \textcolor{red}{n^2} + \frac{\phantom{n^3}}{I} + \frac{\phantom{n^3}}{L}$$

**Step 3: Multiply the *Inner*.**

$$\overset{n^3}{F} - \overset{n^2}{O} + \textcolor{red}{4n} + \frac{\phantom{n^3}}{L}$$

**Step 4: Multiply the *Last*.**

$$\overset{n^3}{F} - \overset{n^2}{O} + \frac{4n}{I} - \textcolor{red}{4} \frac{\phantom{n^3}}{L}$$

**Step 5: Combine like terms—there are none.**

$$n^3 - n^2 + 4n - 4$$

## Try It

31) Multiply:  $(x^2 + 6)(x - 8)$

**Solution**

$$x^3 - 8x^2 + 6x - 48$$

32) Multiply:  $(y^2 + 7)(y - 9)$

**Solution**

$$y^3 - 9y^2 + 7y - 63$$

## Example 5.3.16

Multiply:  $(3pq + 5)(6pq - 11)$

**Solution**

$$(3pq + 5)(6pq - 11)$$

Figure 5.3.22

**Step 1: Multiply the *First*.**

$$\underset{F}{18p^2q^2} + \underset{O}{\phantom{0}} + \underset{I}{\phantom{0}} + \underset{L}{\phantom{0}}$$

**Step 2: Multiply the *Outer*.**

$$\underset{F}{18p^2q^2} - \underset{O}{33pq} + \underset{I}{\phantom{0}} + \underset{L}{\phantom{0}}$$

**Step 3: Multiply the *Inner*.**

$$\underset{F}{18p^2q^2} - \underset{O}{33pq} + \underset{I}{30pq} + \underset{L}{\phantom{0}}$$

**Step 4: Multiply the *Last*.**

$$\underset{F}{18p^2q^2} - \underset{O}{33pq} + \underset{I}{30pq} - \underset{L}{55}$$

**Step 5: Combine like terms—there are none.**

$$18p^2q^2 - 3pq - 55$$

## Try It

33) Multiply:  $(2ab + 5)(4ab - 4)$

**Solution**

$$8a^2b^2 + 12ab - 20$$

34) Multiply:  $(2xy + 3)(4xy - 5)$

**Solution**

$$8x^2y^2 + 2xy - 15$$

## Multiply a Binomial by a Binomial Using the Vertical Method

The FOIL method is usually the quickest method for multiplying two binomials, but it *only* works for binomials. You can use the Distributive Property to find the product of any two polynomials. Another method that works for all polynomials is the Vertical Method. It is very much like the method you use to multiply whole numbers. Look carefully at this example of multiplying two-digit numbers.

23	
<u>×46</u>	
138	partial product     Start by multiplying 23 by 6 to get 138.
<u>92</u>	partial product     Next, multiply 23 by 4, lining up the partial product in the correct columns.
1058	product     Last you add the partial products.

Now we'll apply this same method to multiply two binomials.

### Example 5.3.17

Multiply using the Vertical Method:  $(3y - 1)(2y - 6)$

**Solution**

It does not matter which binomial goes on the top.

**Step 1: Multiply  $3y - 1$  by  $-6$**

**Step 2: Multiply  $3y - 1$  by  $2y$**

**Step 3: Add like terms.**

Notice the partial products are the same as the terms in the FOIL method.

$$\begin{array}{r}
 \phantom{(3y - 1)(2y - 6)} \phantom{\times} 3y - 1 \\
 \phantom{(3y - 1)(2y - 6)} \times 2y - 6 \\
 \hline
 6y^2 - 2y - 18y + 6 \phantom{00} - 18y + 6 \\
 \hline
 6y^2 - 20y + 6 \phantom{00} 6y^2 - 2y \\
 \hline
 6y^2 - 20x + 6
 \end{array}$$

### Try It

35) Multiply using the Vertical Method:  $(5m - 7)(3m - 6)$

**Solution**

$$15m^2 - 51m + 42$$

36) Multiply using the Vertical Method:  $(6b - 5)(7b - 3)$

**Solution**

$$42b^2 - 53b + 15$$

We have now used three methods for multiplying binomials. Be sure to practice each method, and try to decide which one you prefer. The methods are listed here all together, to help you remember them.

## Multiplying Two Binomials

### HOW TO

To multiply binomials, use the:

- Distributive Property
- FOIL Method
- Vertical Method

Remember, FOIL only works when multiplying two binomials.

## Multiply a Trinomial by a Binomial

We have multiplied monomials by monomials, monomials by polynomials, and binomials by binomials. Now we're ready to multiply a trinomial by a binomial. Remember, FOIL will not work in this case, but we can use either the Distributive Property or the Vertical Method. We first look at an example using the Distributive Property.

### Example 5.3.18

Multiply using the Distributive Property:  $(b + 3)(2b^2 - 5b + 8)$

**Solution**

$$(b + 3)(2b^2 - 5b + 8)$$

Figure 5.3.23

**Step 1: Distribute.**

$$b(2b^2 - 5b + 8) + 3(2b^2 - 5b + 8)$$

Figure 5.3.24

**Step 2: Multiply.**

$$2b^3 - 5b^2 + 8b + 6b^2 - 15b + 24$$

**Step 3: Combine like terms.**

$$2b^3 + b^2 - 7b + 24$$

**Try It**

37) Multiply using the Distributive Property:  $(y - 3)(y^2 - 5y + 2)$

**Solution**

$$y^3 - 8y^2 + 17y - 6$$

38) Multiply using the Distributive Property:  $(x + 4)(2x^2 - 3x + 5)$

**Solution**

$$2x^3 + 5x^2 - 7x + 20$$

Now let's do this same multiplication using the Vertical Method.

**Example 5.3.19**

Multiply using the Vertical Method:  $(b + 3)(2b^2 - 5b + 8)$

**Solution**

**Step 1: Multiply  $(2b^2 - 5b + 8)$  by 3.**

$$\begin{array}{r} 2b^2 - 5b + 8 \\ \times \quad b + 3 \\ \hline 6b^2 - 15b + 24 \end{array}$$

**Step 2: Multiply  $(2b^2 - 5b + 8)$  by  $b$ .**

$$2b^3 - 5b^2 + 8b$$

**Step 3: Add like terms.**

$$2b^3 + b^2 - 7b + 24$$

It is easier to put the polynomial with fewer terms on the bottom because we get fewer partial products this way.

**Try It**

39) Multiply using the Vertical Method:  $(y - 3)(y^2 - 5y + 2)$

**Solution**

$$y^3 - 8y^2 + 17y - 6$$

40) Multiply using the Vertical Method:  $(x + 4)(2x^2 - 3x + 5)$

**Solution**

$$2x^3 + 5x^2 - 7x + 20$$

We have now seen two methods you can use to multiply a trinomial by a binomial. After you practice each method, you'll probably find you prefer one way over the other. We list both methods are listed here, for easy reference.

## Multiplying a Trinomial by a Binomial

### HOW TO

To multiply a trinomial by a binomial, use the:

- Distributive Property
- Vertical Method

Access these online resources for additional instruction and practice with multiplying polynomials:

- [Multiplying Exponents 1](#)
- [Multiplying Exponents 2](#)
- [Multiplying Exponents 3](#)

### Key Concepts

- **FOIL Method for Multiplying Two Binomials**—To multiply two binomials:
  1. Multiply the **F**irst terms.

2. Multiply the **Outer** terms.
3. Multiply the **Inner** terms.
4. Multiply the **Last** terms.

• **Multiplying Two Binomials**—To multiply binomials, use the:

- Distributive Property (Example 5.3.7)
- FOIL Method (Example 5.3.11)
- Vertical Method (Example 5.3.17)

• **Multiplying a Trinomial by a Binomial**—To multiply a trinomial by a binomial, use the:

- Distributive Property (Example 5.3.18)
- Vertical Method (Example 5.3.19)

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=2751#h5p-28>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## 5.4 SPECIAL PRODUCTS

---

### Learning Objectives

By the end of this section, you will be able to:

- Square a binomial using the Binomial Squares Pattern
- Multiply conjugates using the Product of Conjugates Pattern
- Recognize and use the appropriate special product pattern

### Try It

Before you get started, take this readiness quiz:

1) Simplify:

- a.  $9^2$
- b.  $(-9)^2$
- c.  $-9^2$

### Square a Binomial Using the Binomial Squares Pattern

Mathematicians like to look for patterns that will make their work easier. A good example of this is squaring binomials. While you can always get the product by writing the binomial twice and using the methods of the last section, there is less work to do if you learn to use a pattern.

---

Let's start by looking at  $(x + 9)^2$

What does this mean?  $(x + 9)^2$

It means to multiply  $(x + 9)$  by itself.  $(x + 9)(x + 9)$

Then, using FOIL, we get:  $x^2 + 9x + 9x + 81$

Combining like terms gives:  $x^2 + 18x + 81$

---

Here's another one:  $(y - 7)^2$

Multiply  $(y - 7)$  by itself.  $(y - 7)(y - 7)$

Using FOIL, we get:  $(y^2 - 7y - 7y + 49)$

And combining like terms:  $y^2 - 14y + 49$

---

And one more:  $(2x + 3)^2$

Multiply.  $(2x + 3)(2x + 3)$

Use FOIL:  $4x^2 + 6x + 6x + 9$

Combine like terms.  $4x^2 + 12x + 9$

---

Look at these results. Do you see any patterns?

What about the number of terms? In each example, we squared a binomial and the result was a trinomial.

$$(a + b)^2 = \underline{\hspace{1cm}} + \underline{\hspace{1cm}} + \underline{\hspace{1cm}}$$

Now look at the *first term* in each result. Where did it come from?

$$(\textcolor{red}{x} + \textcolor{blue}{9})^2$$

$$(\textcolor{red}{y} - \textcolor{blue}{7})^2$$

$$(\textcolor{red}{2x} + \textcolor{blue}{3})^2$$

$$(\textcolor{red}{x} + \textcolor{blue}{9})(\textcolor{red}{x} + \textcolor{blue}{9})$$

$$(\textcolor{red}{y} - \textcolor{blue}{7})(\textcolor{red}{y} - \textcolor{blue}{7})$$

$$(\textcolor{red}{2x} + \textcolor{blue}{3})(\textcolor{red}{2x} + \textcolor{blue}{3})$$

$$\textcolor{red}{x}^2 + 9x + 9x + \textcolor{blue}{81}$$

$$\textcolor{red}{y}^2 - 7y - 7y + \textcolor{blue}{49}$$

$$\textcolor{red}{4x}^2 + 6x + 6x + \textcolor{blue}{9}$$

$$\textcolor{red}{x}^2 + 18x + \textcolor{blue}{81}$$

$$\textcolor{red}{y}^2 - 14y + \textcolor{blue}{49}$$

$$\textcolor{red}{4x}^2 + 12x + \textcolor{blue}{9}$$

The first term is the product of the first terms of each binomial. Since the binomials are identical, it is just the square of the first term!

$$(a + b)^2 = a^2 + \underline{\hspace{1cm}} + \underline{\hspace{1cm}}$$

To get the *first term* of the product, *square the first term*.

Where did the *last term* come from? Look at the examples and find the pattern.

The last term is the product of the last terms, which is the square of the last term.

$$(a + b)^2 = \underline{\hspace{1cm}} + \underline{\hspace{1cm}} + b^2$$

*To get the last term of the product, square the last term.*

Finally, look at the *middle term*. Notice it came from adding the “outer” and the “inner” terms—which are both the same! So the middle term is double the product of the two terms of the binomial.

$$(a + b)^2 = \underline{\hspace{1cm}} + 2ab + \underline{\hspace{1cm}}$$

$$(a - b)^2 = \underline{\hspace{1cm}} - 2ab + \underline{\hspace{1cm}}$$

*To get the middle term of the product, multiply the terms and double their product.*

Putting it all together:

## Binomial Squares Pattern

if  $a$  and  $b$  are real numbers,

$$\underbrace{(a + b)^2}_{(\text{binomial})^2} = \underbrace{a^2}_{(\text{first term})} + \underbrace{2ab}_{2(\text{product of terms})} + \underbrace{b^2}_{(\text{last term})^2}$$

$$\begin{aligned} (a + b)^2 &= a^2 + 2ab + b^2 \\ (a - b)^2 &= a^2 - 2ab + b^2 \end{aligned}$$

To square a binomial:

- square the first term
- square the last term
- double their product

A number example helps verify the pattern.

---

$$(10 + 4)^2$$

Square the first term.  $10^2 + \underline{\hspace{1cm}} +$

Square the last term.  $10^2 + \underline{\hspace{1cm}} + 4^2$

Double their product.  $10^2 + 2 \times 10 \times 4 + 4^2$

Simplify.  $100 + 80 + 16$

Simplify.  $196$

---

To multiply  $(10 + 4)^2$  usually you'd follow the Order of Operations.

$$\begin{aligned} &= (10 + 4)^2 \\ &= 14^2 \\ &= 196 \end{aligned}$$

The pattern works!

### Example 5.4.1

Multiply:  $(x + 5)^2$

**Solution**

$$\left( \overset{a}{x} + \overset{b}{5} \right)^2$$

**Step 1: Square the first term.**

$$\overset{a^2}{x^2} + \overset{2b}{\underline{\hspace{1cm}}} + \overset{b^2}{\underline{\hspace{1cm}}}$$

**Step 2: Square the last term.**

$$\overset{a^2}{x^2} + \overset{2b}{\underline{\hspace{1cm}}} + \overset{b^2}{5^2}$$

**Step 3: Double the product.**

$$a^2 + 2 \times a \times b + b^2$$

$$x^2 + 2 \times x \times 5 + 5^2$$

**Step 4: Simplify.**

$$x^2 + 10x + 25$$

## Try It

2) Multiply:  $(x + 9)^2$

**Solution**

$$x^2 + 18x + 81$$

3) Multiply:  $(y + 11)^2$

**Solution**

$$y^2 + 22y + 121$$

## Example 5.4.2

Multiply:  $(y - 3)^2$

**Solution**

$$\left( \overset{a}{y} - \overset{b}{3} \right)^2$$

**Step 1: Square the first term.**

$$a^2 - 2b + b^2$$

$$y^2 - \underline{\hspace{1cm}} + \underline{\hspace{1cm}}$$

**Step 2: Square the last term.**

$$a^2 - 2b + b^2$$

$$y^2 - \underline{\hspace{1cm}} + 3^2$$

**Step 3: Double the product.**

$$a^2 - 2 \times a \times b + b^2$$

$$y^2 - 2 \times y \times 3 + 3^2$$

**Step 4: Simplify.**

$$y^2 - 6y + 9$$

## Try It

4) Multiply:  $(x - 9)^2$

**Solution**

$$x^2 - 18x + 81$$

5) Multiply:  $(p - 13)^2$

**Solution**

$$p^2 - 26p + 169$$

**Example 5.4.3**

Multiply:  $(4x + 6)^2$

**Solution**

$$\left( \overset{a}{4x} + \overset{b}{6} \right)^2$$

**Step 1: Use the pattern.**

$$\overset{a^2}{(4x)^2} + 2 \times \overset{a}{4x} \times \overset{b}{6} + \overset{b^2}{6^2}$$

**Step 2: Simplify.**

$$16x^2 + 48x + 36$$

**Try It**

6) Multiply:  $(6x + 3)^2$

**Solution**

$$36x^2 + 36x + 9$$

7) Multiply:  $(4x + 9)^2$

**Solution**

$$16x^2 + 72x + 81$$

**Example 5.4.4**

Multiply:  $(2x - 3y)^2$

**Solution**

$$\left( \overset{a}{2x} - \overset{b}{3y} \right)^2$$

**Step 1: Use the pattern.**

$$\overset{a^2}{(2x)^2} - 2 \times \overset{a}{2x} \times \overset{b}{3y} + \overset{b^2}{(3y)^2}$$

**Step 2: Simplify.**

$$4x^2 - 12xy + 9y^2$$

**Try It**

8) Multiply:  $(2c - d)^2$

**Solution**

$$4c^2 - 4cd + d^2$$

9) Multiply:  $(4x - 5y)^2$

**Solution**

$$16x^2 - 40xy + 25y^2$$

**Example 5.4.5**

Multiply:  $(4u^3 + 1)^2$

**Solution**

$$\left( \overset{a}{4u^3} + \overset{b}{1} \right)^2$$

**Step 1: Use the pattern.**

$$\overset{a^2}{(4u)^2} + 2 \times \overset{a}{4u^3} \times \overset{b}{1} + \overset{b^2}{(1)^2}$$

**Step 2: Simplify.**

$$16u^6 + 8u^3 + 1$$

**Try It**

10) Multiply:  $(2x^2 + 1)^2$

**Solution**

$$4x^4 + 4x^2 + 1$$

11) Multiply:  $(3y^3 + 2)^2$

**Solution**

$$9y^6 + 12y^3 + 4$$

We just saw a pattern for squaring binomials that we can use to make multiplying some binomials easier.

Similarly, there is a pattern for another product of binomials. But before we get to it, we need to introduce some vocabulary.

What do you notice about these pairs of binomials?

$$(x - 9)(x + 9) \qquad (y - 8)(y + 8) \qquad (2x - 5)(2x + 5)$$

Look at the first term of each binomial in each pair.

$$(\textcolor{red}{x} - 9)(\textcolor{red}{x} + 9) \qquad (\textcolor{red}{y} - 8)(\textcolor{red}{y} + 8) \qquad (\textcolor{red}{2x} - 5)(\textcolor{red}{2x} + 5)$$

*Notice the first terms are the same in each pair.*

Look at the last terms of each binomial in each pair.

$$\underbrace{(a + b)^2}_{(\text{binomial})^2} = \underbrace{a^2}_{(\text{first term})} + \underbrace{2ab}_{2(\text{product of terms})} + \underbrace{b^2}_{(\text{last term})^2}$$

*Notice the last terms are the same in each pair.*

*Notice how each pair has one sum and one difference.*

$$\left( \begin{array}{c} x-9 \\ \uparrow \\ \text{Difference} \end{array} \right) \left( \begin{array}{c} x+9 \\ \uparrow \\ \text{Sum} \end{array} \right) \qquad \left( \begin{array}{c} y-8 \\ \uparrow \\ \text{Difference} \end{array} \right) \left( \begin{array}{c} y+8 \\ \uparrow \\ \text{Sum} \end{array} \right) \qquad \left( \begin{array}{c} 2x-5 \\ \uparrow \\ \text{Difference} \end{array} \right) \left( \begin{array}{c} 2x+5 \\ \uparrow \\ \text{Sum} \end{array} \right)$$

A pair of binomials that each have the same first term and the same last term, but one is a sum and one is a difference has a special name. It is called a **conjugate pair** and is of the form  $(a - b)$ ,  $(a + b)$ .

## Conjugate Pair

A conjugate pair is two binomials of the form

$$(a - b), (a + b)$$

The pair of binomials each have the same first term and the same last term, but one binomial is a sum and the other is a difference.

There is a nice pattern for finding the product of conjugates. You could, of course, simply FOIL to get the product, but using the pattern makes your work easier.

Let's look for the pattern by using FOIL to multiply some conjugate pairs.

$(x - 9)(x + 9)$	$(y - 8)(y + 8)$	$(2x - 5)(2x + 5)$
$x^2 + 9x - 9x - 81$	$y^2 + 8y - 8y - 64$	$4x^2 + 10x - 10x - 25$
$x^2 - 81$	$y^2 - 64$	$4x^2 - 25$

$$\begin{array}{ccc}
 (x+9)(x-9) & (y-8)(y+8) & (2x-5)(2x+5) \\
 x^2 - 9x + 9x - 81 & y^2 + 8y - 8y - 64 & 4x^2 + 10x - 10x - 25 \\
 x^2 - 81 & y^2 - 64 & 4x^2 - 25
 \end{array}$$

Each *first term* is the product of the first terms of the binomials, and since they are identical it is the square of the first term.

$$(a + b)(a - b) = a^2 \underline{\hspace{1cm}}$$

To get the first term, square the first term.

The *last term* came from multiplying the last terms, the square of the last term.

$$(a + b)(a - b) = a^2 - b^2$$

To get the last term, square the last term.

## What do you observe about the products?

The product of the two binomials is also a binomial! Most of the products resulting from FOIL have been trinomials.

Why is there no middle term? Notice the two middle terms you get from FOIL combine to 0 in every case, the result of one addition and one subtraction.

The product of conjugates is always of the form  $a^2 - b^2$ . This is called a difference of squares.

This leads to the pattern:

### Product of Conjugates Pattern

If  $a$  and  $b$  are real numbers,

$$(a-b)(a+b) = a^2 - b^2$$

Figure 5.4.1

The product is called a difference of squares.

To multiply conjugates, square the first term, square the last term, and write the product as a difference of squares.

Let's test this pattern with a numerical example.

$$(10 - 2)(10 + 2)$$

It is the product of conjugates, so the result will be the difference of two squares.

$$\underline{\hspace{1cm}} - \underline{\hspace{1cm}}$$

Square the first term.

$$10^2 - \underline{\hspace{1cm}}$$

Square the last term.

$$10^2 - 2^2$$

Simplify.

$$\begin{aligned} 100 - 4 \\ = 96 \end{aligned}$$

What do you get using the order of operations?

$$\begin{aligned} (10 - 2)(10 + 2) \\ (8)(12) \\ = 96 \end{aligned}$$

Notice, the result is the same!

### Example 5.4.6

Multiply:  $(x - 8)(x + 8)$

**Solution**

First, recognize this as a product of conjugates. The binomials have the same first terms, and the same last terms, and one binomial is a sum and the other is a difference.

**Step 1: It fits the pattern.**

$$\left( \overset{a}{x} - \overset{b}{8} \right) \left( \overset{a}{x} + \overset{b}{8} \right)$$

**Step 2: Square the first term,  $x$ .**

$$\overset{a^2}{x^2} - \overset{b^2}{\quad}$$

**Step 3: Square the last term, 8.**

$$\overset{a^2}{x^2} - \overset{b^2}{8^2}$$

**Step 4: The product is a difference of squares.**

$$\overset{a^2}{x^2} - \overset{b^2}{64}$$

### Try It

12) Multiply:  $(x - 5)(x + 5)$

**Solution**

$$x^2 - 25$$

13) Multiply:  $(w - 3)(w + 3)$

**Solution**

$$w^2 - 9$$

**Example 5.4.7**

Multiply:  $(2x + 5)(2x - 5)$

**Solution**

Are the binomials conjugates?

**Step 1: It is the product of conjugates.**

$$\left( \overset{a+b}{2x + 5} \right) \left( \overset{a-b}{2x - 5} \right)$$

**Step 2: Square the first term,  $2x$ .**

$$\overset{a^2 - b^2}{(2x)^2} - \underline{\hspace{1cm}}$$

**Step 3: Square the last term, 5.**

$$\overset{a^2 - b^2}{(2x)^2} - 5^2$$

**Step 4: Simplify. The product is a difference of squares.**

$$\overset{a^2 - b^2}{4x^2} - 25$$

## Try It

14) Multiply:  $(6x + 5)(6x - 5)$ .

**Solution**

$$36x^2 - 25$$

15) Multiply:  $(2x + 7)(2x - 7)$

**Solution**

$$4x^2 - 49$$

The binomials in the next example may look backwards – the variable is in the second term. But the two binomials are still conjugates, so we use the same pattern to multiply them.

## Example 5.4.8

Find the product:  $(3 + 5x)(3 - 5x)$

**Solution**

**Step 1: It is the product of conjugates.**

$$\left( 3 \overset{a}{+} \overset{b}{5x} \right) \left( 3 \overset{a}{-} \overset{b}{5x} \right)$$

**Step 2: Use the pattern.**

$$3^2 - \overset{a^2}{(5x)^2}$$

**Step 3: Simplify.**

$$9 - 25x^2$$

## Try It

16) Multiply:  $(7 + 4x)(7 - 4x)$

**Solution**

$$49 - 16x^2$$

17) Multiply:  $(9 - 2y)(9 + 2y)$

**Solution**

$$81 - 4y^2$$

Now we'll multiply conjugates that have two variables.

## Example 5.4.9

Find the product:  $(5m - 9n)(5m + 9n)$

**Solution**

**Step 1: This fits the pattern.**

$$\left(5m^{\textcolor{red}{a} - \textcolor{red}{b}} - 9n\right) \left(5m^{\textcolor{red}{a} + \textcolor{red}{b}} + 9n\right)$$

**Step 2: Use the pattern.**

$$(5m)^{\textcolor{red}{a}^2 - \textcolor{red}{b}^2} - (9n)^2$$

**Step 3: Simplify.**

$$25m^2 - 81n^2$$

## Try It

18) Find the product:  $(4p - 7q)(4p + 7q)$

**Solution**

$$16p^2 - 49q^2$$

19) Find the product:  $(3x - y)(3x + y)$

**Solution**

$$9x^2 - y^2$$

## Example 5.4.10

Find the product:  $(cd - 8)(cd + 8)$

**Solution**

**Step 1:** This fits the pattern.

$$\left( \overset{a-b}{cd} - 8 \right) \left( \overset{a+b}{cd} + 8 \right)$$

**Step 2:** Use the pattern.

$$\left( \overset{a^2-b^2}{cd} \right)^2 - (8)^2$$

**Step 3:** Simplify.

$$c^2d^2 - 64$$

## Try It

20) Find the product:  $(xy - 6)(xy + 6)$

**Solution**

$$x^2y^2 - 36$$

21) Find the product:  $(ab - 9)(ab + 9)$

**Solution**

$$a^2b^2 - 81$$

## Example 5.4.11

Find the product:  $(6u^2 - 11v^5)(6u^2 + 11v^5)$

**Solution**

**Step 1: This fits the pattern.**

$$\left(6u^2 \overset{a-b}{-} 11v^5\right) \left(6u^2 \overset{a+b}{+} 11v^5\right)$$

**Step 2: Use the pattern.**

$$\left(6u^2\right)^{\overset{a^2-b^2}{2}} - \left(11v^5\right)^2$$

**Step 3: Simplify.**

$$36u^4 - 121v^{10}$$

Try It

22) Find the product:  $(3x^2 - 4y^3)(3x^2 + 4y^3)$

**Solution**

$$9x^4 - 16y^6$$

23) Find the product:  $(2m^2 - 5n^3)(2m^2 + 5n^3)$

**Solution**

$$4m^4 - 25n^6$$

# Recognize and Use the Appropriate Special Product Pattern

We just developed special product patterns for Binomial Squares and for the Product of Conjugates. The products look similar, so it is important to recognize when it is appropriate to use each of these patterns and to notice how they differ. Look at the two patterns together and note their similarities and differences.

## Comparing the Special Product Patterns

$$(a - b)(a + b) = a^2 - b^2$$

Binomial Squares	Product of Conjugates
$(a + b)^2 = a^2 + 2ab + b^2$	$(a - b)^2 = a^2 - 2ab + b^2$
– Squaring a binomial	– Multiplying conjugates
– Product is a trinomial	– Product is a binomial
– Inner and outer terms with FOIL are the same.	– Inner and outer terms with FOIL are opposites.
– Middle term is double the product of the terms.	– There is no middle term.

## Example 5.4.12

Choose the appropriate pattern and use it to find the product:

- a.  $(2x - 3)(2x + 3)$
- b.  $(8x - 5)^2$
- c.  $(6m + 7)^2$
- d.  $(5x - 6)(6x + 5)$

### Solution

a.  $(2x - 3)(2x + 3)$  These are conjugates. They have the same first numbers, and the same last numbers, and one binomial is a sum and the other is a difference. It fits the Product of Conjugates pattern.

**Step 1: This fits the pattern.**

$$\left( \overset{a-b}{2x - 3} \right) \left( \overset{a+b}{2x + 3} \right)$$

**Step 2: Use the pattern.**

$$\overset{a^2}{(2x)^2} - \overset{b^2}{3^2}$$

Simplify.  $4x^2 - 9$

---

b.  $(8x - 5)^2$  We are asked to square a binomial. It fits the *binomial squares* pattern.

$$\left( \overset{a-b}{8x - 5} \right)^2$$

**Step 1: Use the pattern.**

$$(8x)^2 - 2 \times \overset{a^2 - 2ab + b^2}{8x \times 5} + 5^2$$

Simplify.  $64x^2 - 80x + 25$

---

c.  $(6m + 7)^2$  Again, we will square a binomial so we use the binomial squares pattern.

$$\left( \overset{a}{6m} + \overset{b}{7} \right)^2$$

**Step 1: Use the pattern.**

$$\begin{array}{l} (6m)^2 + 2 \times \overset{a^2 + 2ab + b^2}{6m} \times 7 + 7^2 \\ \text{Simplify. } 36m^2 + 84m + 49 \end{array}$$

---

d.  $(5x - 6)(6x + 5)$  This product does not fit the patterns, so we will use FOIL.

**Step 1: Use FOIL.**

$$\begin{array}{l} 30x^2 + 25x - 36x - 30 \\ \text{Simplify. } 30x^2 - 11x - 30 \end{array}$$

## Try It

24) Choose the appropriate pattern and use it to find the product:

- a.  $(9b - 2)(2b + 9)$
- b.  $(9p - 4)^2$
- c.  $(7y + 1)^2$
- d.  $(4r - 3)(4r + 3)$

### Solution

- a. FOIL;  $18b^2 + 77b - 18$
- b. Binomial Squares;  $81p^2 - 72p + 16$
- c. Binomial Squares;  $49y^2 + 14y + 1$
- d. Product of Conjugates;  $16r^2 - 9$

25) Choose the appropriate pattern and use it to find the product:

- a.  $(6x + 7)^2$
- b.  $(3x - 4)(3x + 4)$
- c.  $(2x - 5)(5x - 2)$
- d.  $(6n - 1)^2$

**Solution**

- a. Binomial Squares;  $36x^2 + 84x + 49$
- b. Product of Conjugates;  $9x^2 - 16$
- c. FOIL;  $10x^2 - 29x + 10$
- d. Binomial Squares;  $36n^2 - 12n + 1$

Access these online resources for additional instruction and practice with special products:

- [Special Products](#)

## Key Concepts

- **Binomial Squares Pattern**

- If  $a$  and  $b$  are real numbers,

$$\underbrace{(a + b)^2}_{(\text{binomial})^2} = \underbrace{a^2}_{(\text{first term})^2} + \underbrace{2ab}_{2(\text{product of terms})} + \underbrace{b^2}_{(\text{last term})^2}$$

- $(a + b)^2 = a^2 + 2ab + b^2$
- $(a - b)^2 = a^2 - 2ab + b^2$

- To square a binomial: square the first term, square the last term, double their product.

### • Product of Conjugates Pattern

- If  $a$  and  $b$  are real numbers

$$\underbrace{(a - b)(a + b)}_{\text{conjugates}} = \underbrace{a^2}_{\text{squares}} \overset{\text{difference}}{\downarrow} \underbrace{-}_{\text{squares}} \underbrace{b^2}_{\text{squares}}$$

- $(a - b)(a + b) = a^2 - b^2$
- The product is called a difference of squares.

### • To multiply conjugates:

- square the first term square the last term write it as a difference of squares

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

An interactive H5P element has been excluded from this version of the text. You can view it online here:

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=2811#h5p-29>

On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

## Glossary

### conjugate pair

A conjugate pair is two binomials of the form  $(a - b)$ ,  $(a + b)$ ; the pair of binomials each have the same first term and the same last term, but one binomial is a sum and the other is a difference.

## 5.5 DIVIDE MONOMIALS

---

### Learning Objectives

By the end of this section, you will be able to:

- Simplify expressions using the Quotient Property for Exponents
- Simplify expressions with zero exponents
- Simplify expressions using the Quotient to a Power Property
- Simplify expressions by applying several properties
- Use the definition of a negative exponent
- Simplify expressions with integer exponents
- Simplify expressions by applying several properties with negative exponents
- Divide monomials

### Try It

Before you get started, take this readiness quiz:

- 1) Simplify:  $\frac{8}{24}$
- 2) Simplify:  $(2m^3)^5$
- 3) Simplify:  $\frac{12x}{12y}$

## Simplify Expressions Using the Quotient Property for Exponents

Earlier in this chapter, we developed the properties of exponents for multiplication. We summarize these properties below.

### Summary of Exponent Properties for Multiplication

If  $a$  and  $b$  are real numbers, and  $m$  and  $n$  are whole numbers, then

---

<b>Product Property</b>	$a^m \times a^n = a^{m+n}$
-------------------------	----------------------------

<b>Power Property</b>	$(a^m)^n = a^{m \times n}$
-----------------------	----------------------------

<b>Product to a Power</b>	$(ab)^m = a^m b^m$
---------------------------	--------------------

---

Now we will look at the exponent properties for division. A quick memory refresher may help before we get started. You have learned to simplify fractions by dividing out common factors from the numerator and denominator using the *Equivalent Fractions Property*. This property will also help you work with algebraic fractions—which are also quotients.

### Equivalent Fractions Property

If  $a$ ,  $b$ , and  $c$  are whole numbers where  $b \neq 0$ ,  $c \neq 0$  then

$$\frac{a}{b} = \frac{a \times c}{b \times c} \text{ and } \frac{a \times c}{b \times c} = \frac{a}{b}$$

As before, we'll try to discover a property by looking at some examples.

	Example 1	Example 2
Consider	$\frac{x^5}{x^2}$	$\frac{x^2}{x^3}$
What do they mean?	$\frac{x \cdot x \cdot x \cdot x \cdot x}{x \cdot x}$	$\frac{x \cdot x}{x \cdot x \cdot x}$
Use the Equivalent Fractions Property.	$\frac{\cancel{x} \cdot \cancel{x} \cdot x \cdot x \cdot x}{\cancel{x} \cdot \cancel{x}}$	$\frac{\cancel{x} \cdot \cancel{x} \cdot 1}{\cancel{x} \cdot \cancel{x} \cdot x}$
Simplify	$x^3$	$\frac{1}{x}$

Notice, in each case the bases were the same and we subtracted exponents.

When the larger exponent was in the numerator, we were left with factors in the numerator.

When the larger exponent was in the denominator, we were left with factors in the denominator—notice the numerator of 1.

We write:

$\frac{x^5}{x^2}$	$\frac{x^2}{x^3}$
$x^{5-2}$	$\frac{1}{x^{3-2}}$
$x^3$	$\frac{1}{x}$

This leads to the *Quotient Property for Exponents*.

## Quotient Property for Exponents

If  $a$  is a real number,  $a \neq 0$ , and  $n$  are whole numbers, then

$$\frac{a^m}{a^n} = a^{m-n}, m > n \text{ and } \frac{a^m}{a^n} = \frac{1}{a^{n-m}}, n > m$$

A couple of examples with numbers may help to verify this property.

$\frac{3^4}{3^2} = 3^{4-2}$	$\frac{5^2}{5^3} = \frac{1}{5^{3-2}}$
$\frac{81}{9} = 3^2$	$\frac{25}{125} = \frac{1}{5^1}$
$9 = 9\checkmark$	$\frac{1}{5} = \frac{1}{5}\checkmark$

### Example 5.5.1

Simplify:

a.  $\frac{x^9}{x^7}$

b.  $\frac{3^{10}}{3^2}$

#### Solution

To simplify an expression with a quotient, we need to first compare the exponents in the numerator and denominator.

a.

**Step 1:** Since  $9 > 7$ , there are more factors of  $x$  in the numerator.

$$\frac{x^9}{x^7}$$

**Step 2:** Use the Quotient Property,  $\frac{a^m}{a^n} = a^{m-n}$

$$\begin{aligned} &= x^{9-7} \\ \text{Simplify. } &= x^2 \end{aligned}$$

b.

**Step 1:** Since  $10 > 2$ , there are more factors of  $x$  in the numerator.

$$\frac{3^{10}}{3^2}$$

**Step 2:** Use the Quotient Property,  $\frac{a^m}{a^n} = a^{m-n}$

$$\begin{aligned} &= 3^{10-2} \\ \text{Simplify. } &= 3^8 \end{aligned}$$

Notice that when the larger exponent is in the numerator, we are left with factors in the numerator.

## Try It

4) Simplify:

a.  $\frac{x^{15}}{x^{10}}$

b.  $\frac{6^{14}}{6^5}$

**Solution**

a.  $x^5$

b.  $6^9$

5) Simplify:

a.  $\frac{y^{43}}{y^{37}}$

b.  $\frac{10^{15}}{10^7}$

**Solution**

a.  $y^6$

b.  $10^8$

**Example 5.5.2**

Simplify:

a.  $\frac{b^8}{b^{12}}$

b.  $\frac{7^3}{7^5}$

**Solution**

To simplify an expression with a quotient, we need to first compare the exponents in the numerator and denominator.

a.

**Step 1:** Since  $12 > 8$ , there are more factors of  $b$  in the denominator.

$$\frac{b^8}{b^{12}}$$

**Step 2:** Use the Quotient Property,  $\frac{a^m}{a^n} = \frac{1}{a^{n-m}}$

$$\begin{aligned} &= \frac{1}{b^{12-8}} \\ \text{Simplify. } &= \frac{1}{b^4} \end{aligned}$$

---

b.

**Step 1:** Since  $5 > 3$ , there are more factors of 3 in the denominator.

$$\begin{aligned} &\frac{7^3}{7^5} \\ \text{Step 2: Use the Quotient Property, } \frac{a^m}{a^n} &= \frac{1}{a^{n-m}} \end{aligned}$$

$$\begin{aligned} &= \frac{1}{7^{5-3}} \\ \text{Simplify. } &= \frac{1}{7^2} \end{aligned}$$

$$\text{Simplify. } = \frac{1}{49}$$

Notice that when the larger exponent is in the denominator, we are left with factors in the denominator.

## Try It

6) Simplify:

a.  $\frac{x^{18}}{x^{22}}$

b.  $\frac{12^{15}}{12^{30}}$

**Solution**

a.  $\frac{1}{x^4}$

b.  $\frac{1}{12^{15}}$

7) Simplify:

a.  $\frac{m^7}{m^{15}}$

b.  $\frac{9^8}{9^{19}}$

**Solution**

a.  $\frac{1}{m^8}$

b.  $\frac{1}{9^{11}}$

Notice the difference in the two previous examples:

- If we start with more factors in the numerator, we will end up with factors in the numerator.
- If we start with more factors in the denominator, we will end up with factors in the denominator.

The first step in simplifying an expression using the *Quotient Property for Exponents* is to determine whether the exponent is larger in the numerator or the denominator. Later in this chapter, we will explore this further while using negative exponents.

**Example 5.5.3**

Simplify:

a.  $\frac{a^5}{a^9}$

b.  $\frac{x^{11}}{x^7}$

**Solution**

a. Is the exponent of  $a$  larger in the numerator or denominator? Since  $9 > 5$ , there are more  $a$ 's in the denominator and so we will end up with factors in the denominator.

**Step 1: Use the Quotient Property,**  $\frac{a^m}{a^n} = \frac{1}{a^{n-m}}$

$$= \frac{1}{a^{9-5}}$$

Simplify.  $= \frac{1}{a^4}$

---

b. Notice there are more factors of  $x$  in the numerator, since  $11 > 7$ . So we will end up with factors in the numerator.

**Step 1: Use the Quotient Property,**  $\frac{a^m}{a^n} = \frac{1}{a^{n-m}}$

$$= x^{11-7}$$

Simplify.  $= x^4$

**Try It**

8) Simplify:

a.  $\frac{b^{19}}{b^{11}}$

b.  $\frac{z^5}{z^{11}}$

**Solution**

a.  $b^8$

b.  $\frac{1}{z^6}$

9) Simplify:

a.  $\frac{p^9}{p^{17}}$

b.  $\frac{w^{13}}{w^9}$

**Solution**

a.  $\frac{1}{p^8}$

b.  $w^4$

## Simplify Expressions with an Exponent of Zero

A special case of the Quotient Property is when the exponents of the numerator and denominator are equal, such as an expression like  $\frac{a^m}{a^m}$ . From your earlier work with fractions, you know that:

$$\frac{2}{2} = 1$$

$$\frac{17}{17} = 1$$

$$\frac{-43}{-43} = 1$$

In words, a number divided by itself is 1. So,  $\frac{x}{x} = 1$ , for any  $x$  ( $x \neq 0$ ), since any number divided by itself is 1.

The *Quotient Property for Exponents* shows us how to simplify  $\frac{a^m}{a^n}$  when  $m > n$  and when  $n < m$  by subtracting exponents. What if  $m = n$ ?

Consider  $\frac{8}{8}$ , which we know is 1.

$$\frac{8}{8} = 1$$

Write 8 as  $2^3$

$$\frac{2^3}{2^3} = 1$$

Subtract exponents

$$2^{3-3} = 1$$

Simplify

$$2^0 = 1$$

Now we will simplify  $\frac{a^m}{a^m}$  in two ways to lead us to the definition of the zero exponent. In general, for  $a \neq 0$ :

$$\frac{a^m}{a^m}$$

$$\frac{a^m}{a^m}$$

$$a^{m-m} \quad \frac{\overbrace{a \cdot a \cdot \dots \cdot a}^{m \text{ factors}}}{\underbrace{a \cdot a \cdot \dots \cdot a}_{m \text{ factors}}}$$

$$a^0$$

$$1$$

We see  $\frac{a^m}{a^m}$  simplifies to  $a^0$  and to 1. So  $a^0 = 1$

## Zero Exponent

If  $a$  is a non-zero number, then  $a^0 = 1$ .

Any nonzero number raised to the zero power is **1**.

In this text, we assume any variable that we raise to the zero power is not zero.

### Example 5.5.4

Simplify:

a.  $9^0$

b.  $n^0$

**Solution**

The definition says any non-zero number raised to the zero power is **1**.

a.

**Step 1: Use the definition of the zero exponent.**

$$\begin{aligned} &= 9^0 \\ &= 1 \end{aligned}$$

---

b.

**Step 1: Use the definition of the zero exponent.**

$$\begin{aligned} &= n^0 \\ &= 1 \end{aligned}$$

### Try It

10) Simplify:

a.  $15^0$

b.  $m^0$

**Solution**

a. 1

b. 1

11) Simplify:

a.  $k^0$ b.  $29^0$ **Solution**

a. 1

b. 1

Now that we have defined the zero exponent, we can expand all the *Properties of Exponents* to include whole number exponents.

What about raising an expression to the zero power? Let's look at  $(2x)^0$ . We can use the product to a power rule to rewrite this expression.

	$(2x)^0$
Use the product to a power rule.	$2^0 x^0$
Use the zero exponent property.	$1 \times 1$
Simplify	1

This tells us that any nonzero expression raised to the zero power is one.

**Example 5.5.5**

Simplify:

a.  $(5b)^0$ b.  $(-4a^2b)^0$ **Solution**

a.

**Step 1:** Use the definition of the zero exponent.

$$\begin{aligned} &= (5b)^0 \\ &= 1 \end{aligned}$$

---

b.

**Step 1:** Use the definition of the zero exponent.

$$\begin{aligned} &= (-4a^{2b})^0 \\ &= 1 \end{aligned}$$

## Try It

12) Simplify:

a.  $(11z)^0$

b.  $(-11pq^3)^0$

**Solution**

a. 1

b. 1

13) Simplify:

a.  $(-6d)^0$

b.  $(-8m^2n^3)^0$

**Solution**

a. 1

b. 1

## Simplify Expressions Using the Quotient to a Power

## Property

Now we will look at an example that will lead us to the *Quotient to a Power Property*.

$$\begin{aligned} & \left(\frac{x}{y}\right)^3 \\ \text{This means:} & \quad \frac{x}{y} \cdot \frac{x}{y} \cdot \frac{x}{y} \\ \text{Multiply the fractions.} & \quad \frac{x \cdot x \cdot x}{y \cdot y \cdot y} \\ \text{Write with exponents.} & \quad \frac{x^3}{y^3} \end{aligned}$$

Notice that the exponent applies to both the numerator and the denominator.

$$\begin{aligned} \text{We write:} & \quad \left(\frac{x}{y}\right)^3 \\ & \quad \frac{x^3}{y^3} \end{aligned}$$

This leads to the *Quotient to a Power Property for Exponents*.

### Quotient to a Power Property for Exponents

If  $a$  and  $b$  are real numbers,  $b \neq 0$ , and  $m$  is a counting number, then

$$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$$

To raise a fraction to a power, raise the numerator and denominator to that power.

An example with numbers may help you understand this property:

$$\begin{aligned} \left(\frac{2}{3}\right)^3 &= \frac{2^3}{3^3} \\ \frac{2}{3} \cdot \frac{2}{3} \cdot \frac{2}{3} &= \frac{8}{27} \\ \frac{8}{27} &= \frac{8}{27} \checkmark \end{aligned}$$

## Example 5.5.6

Simplify:

a.  $\left(\frac{3}{7}\right)^2$

b.  $\left(\frac{b}{3}\right)^4$

c.  $\left(\frac{k}{j}\right)^3$

**Solution**

a.

$$\begin{aligned} \text{Step 1: Use the Quotient Property, } \left(\frac{a}{b}\right)^m &= \frac{a^m}{b^m} \\ &= \frac{3^2}{7^2} \\ \text{Simplify.} &= \frac{9}{49} \end{aligned}$$

---

b.

$$\begin{aligned} \text{Step 1: Use the Quotient Property, } \left(\frac{a}{b}\right)^m &= \frac{a^m}{b^m} \\ &= \frac{b^4}{3^4} \\ \text{Simplify.} &= \frac{b^4}{81} \end{aligned}$$

---

c.

**Step 1: Raise the numerator and denominator to the third power.**

$$\frac{k^3}{j^3}$$

## Try It

14) Simplify:

a.  $(\frac{5}{8})^2$

b.  $(\frac{p}{10})^4$

c.  $(\frac{m}{n})^7$

**Solution**

a.  $\frac{25}{64}$

b.  $\frac{p^4}{10,000}$

c.  $\frac{m^7}{n^7}$

15) Simplify:

a.  $(\frac{1}{3})^3$

b.  $(\frac{-2}{q})^3$

c.  $(\frac{w}{x})^4$

**Solution**

a.  $\frac{1}{27}$

b.  $\frac{-8}{q^3}$

c.  $\frac{w^4}{x^4}$

## Simplify Expressions by Applying Several Properties

We'll now summarize all the properties of exponents so they are all together to refer to as we simplify expressions using several properties. Notice that they are now defined for whole number exponents.

### Summary of Exponent Properties

If  $a$  and  $b$  are real numbers, and  $m$  and  $n$  are whole numbers, then

<b>Product Property</b>	$a^m \times a^n = a^{m+n}$
<b>Power Property</b>	$(a^m)^n = a^{m \times n}$
<b>Product to a Power</b>	$(ab)^m = a^m b^m$
<b>Quotient Property</b>	$\frac{a^m}{b^m} = a^{m-n}, a \neq 0, m > n$
	$\frac{a^m}{a^n} = \frac{1}{a^{n-m}}, a \neq 0, n > m$
<b>Zero Exponent Definition</b>	$a^0 = 1, a \neq 0$
<b>Quotient to a Power Property</b>	$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}, b \neq 0$

#### Example 5.5.7

Simplify:  $\frac{(y^4)^2}{y^6}$

**Solution**

**Step 1:** Multiply the exponents in the numerator.

$$\frac{y^8}{y^6}$$

**Step 2: Subtract the exponents.**

$$y^2$$

## Try It

16) Simplify:  $\frac{(m^5)^4}{m^7}$

**Solution**

$$m^{13}$$

17) Simplify:  $\frac{(k^2)^6}{k^7}$

**Solution**

$$k^5$$

## Example 5.5.8

Simplify:  $\frac{b^{12}}{(b^2)^6}$

**Solution**

**Step 1: Multiply the exponents in the numerator.**

$$\frac{b^{12}}{b^{12}}$$

**Step 2: Subtract the exponents.**

$$\begin{aligned} &= b^0 \\ \text{Simplify. } &= 1 \end{aligned}$$

## Try It

18) Simplify:  $\frac{n^{12}}{(n^3)^4}$

**Solution**

1

19) Simplify:  $\frac{x^{15}}{(x^3)^5}$

**Solution**

1

## Example 5.5.9

Simplify:  $\left(\frac{y^9}{y^4}\right)^2$

**Solution**

**Step 1: Remember parentheses come before exponents.**

Notice the bases are the same, so we can simplify inside the parentheses.

Subtract the exponents.

$$(y^5)^2$$

**Step 2: Multiply the exponents.**

$$y^{10}$$

## Try It

20) Simplify:  $\left(\frac{r^5}{r^3}\right)^4$

**Solution**

$$r^8$$

21) Simplify:  $\left(\frac{v^6}{v^4}\right)^3$

**Solution**

$$v^6$$

## Example 5.5.10

Simplify:  $\left(\frac{j^2}{k^3}\right)^4$

**Solution**

Here we cannot simplify inside the parentheses first, since the bases are not the same.

**Step 1:** Raise the numerator and denominator to the third power using the Quotient to a Power

Property,  $\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$

$$\left(\frac{j^2}{k^3}\right)^4$$

**Step 2:** Use the Power Property and simplify.

$$\frac{j^8}{k^{12}}$$

## Try It

22) Simplify:  $\left(\frac{a^3}{b^2}\right)^4$

**Solution**

$$\frac{a^{12}}{b^8}$$

23) Simplify:  $\left(\frac{q^7}{r^5}\right)^3$

**Solution**

$$\frac{q^{21}}{r^{15}}$$

**Example 5.5.11**

Simplify:  $\left(\frac{2m^2}{5n}\right)^4$

**Solution**

**Step 1:** Raise the numerator and denominator to the fourth power, using the Quotient to a Power

Property,  $\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$

$$\frac{(2m^2)^4}{(5n)^4}$$

**Step 2:** Raise each factor to the fourth power.

$$\frac{(2m^2)^4}{(5n)^4}$$

**Step 3:** Use the Power Property and simplify.

$$\frac{16m^8}{625n^4}$$

**Try It**

24) Simplify:  $\left(\frac{7x^3}{9y}\right)^2$

**Solution**

$$\frac{49x^6}{81y^2}$$

25) Simplify:  $\left(\frac{3x^4}{7y}\right)^2$

**Solution**

$$\frac{9x^8}{49y^2}$$

### Example 5.5.12

Simplify:  $\frac{(x^3)^4 \times (x^2)^5}{(x^6)^5}$

**Solution**

**Step 1: Use the Power Property,  $(a^m)^n = a^{mn}$**

$$\frac{(x^{12}) \times (x^{10})}{(x^{30})}$$

**Step 2: Add the exponents in the numerator.**

$$\frac{x^{22}}{x^{30}}$$

**Step 3: Use the Quotient Property,  $\frac{a^m}{a^n} = \frac{1}{a^{n-m}}$**

$$\frac{1}{x^8}$$

## Try It

26) Simplify:  $\frac{(a^2)^3(a^2)^4}{(a^4)^5}$

**Solution**

$$\frac{1}{a^6}$$

27) Simplify:  $\frac{(p^3)^4(p^5)^3}{(p^7)^6}$

**Solution**

$$\frac{1}{p^{15}}$$

## Example 5.5.13

Simplify:  $\frac{(10p^3)^2}{(5p)^3 \cdot (2p^5)^4}$

**Solution**

**Step 1: Use the Product to a Power Property,  $(ab)^m = a^m b^m$**

$$\frac{(10)^2(p^3)^2}{(5)^3(p)^3 \cdot (2)^4(p^5)^4}$$

**Step 2: Use the Power Property,  $a^{m \cdot n} = a^{m \times n}$**

$$\frac{100p^6}{125p^3 \cdot 16p^{20}}$$

**Step 3:** Add the exponents in the denominator.

$$\frac{100p^6}{125 \times 16p^{23}}$$

**Step 4:** Use the Quotient Property,  $\frac{a^m}{a^n} = \frac{1}{a^{n-m}}$

$$= \frac{100}{125 \times 16p^{17}}$$

$$\text{Simplify. } = \frac{1}{20p^{17}}$$

## Try It

28) Simplify:  $\frac{(3r^{3^2}(r^3)^7}{(r^3)^3}$

**Solution**

$$9r^{18}$$

29) Simplify:  $\frac{(2x^4)^5}{(4x^3)^2(x^3)^5}$

**Solution**

$$\frac{2}{x}$$

## Use the Definition of a Negative Exponent

Up until this point, we have been careful to minimize our use of negative exponents. Before taking on division of polynomials, we will revisit some of the properties we've seen in the previous sections but, this time, with negative exponents.

### Quotient Property for Exponents

If  $a$  is a real number,  $a \neq 0$ , and  $m$  and  $n$  are whole numbers, then

$$\frac{a^m}{a^n} = a^{m-n}, \text{ for } m > n \text{ and } \frac{a^m}{a^n} = \frac{1}{a^{n-m}}, \text{ for } n > m.$$

What if we just subtract exponents regardless of which is larger?

Let's consider  $\frac{x^2}{x^5}$ .

We subtract the exponent in the denominator from the exponent in the numerator.

$$\begin{aligned} &= \frac{x^2}{x^5} \\ &= x^{2-5} \\ &= x^{-3} \end{aligned}$$

We can also simplify  $\frac{x^2}{x^5}$  by dividing out common factors:

$$\begin{aligned} &= \frac{\cancel{x} \cdot \cancel{x}}{\cancel{x} \cdot \cancel{x} \cdot x \cdot x \cdot x} \\ &= \frac{1}{x^3} \end{aligned}$$

This implies that  $x^{-3} = \frac{1}{x^3}$  and it leads us to the definition of a *negative exponent*.

## Negative Exponents

If  $n$  is an integer and  $a \neq 0$ , then  $a^{-n} = \frac{1}{a^n}$ .

The negative exponent tells us we can re-write the expression by taking the reciprocal of the base and then changing the sign of the exponent.

Any expression that has negative exponents is not considered to be in simplest form. We will use the definition of a negative exponent and other properties of exponents to write the expression with only positive exponents.

For example, if after simplifying an expression we end up with the expression  $x^{-3}$ , we will take one more step and write  $\frac{1}{x^3}$ . The answer is considered to be in simplest form when it has only positive exponents.

### Example 5.5.14

Simplify:

a.  $4^{-2}$

b.  $10^{-3}$

**Solution**

a.

**Step 1:** Use the definition of a negative exponent,  $a^{-n} = \frac{1}{a^n}$ .

$$= \frac{1}{4^2}$$

Simplify.  $= \frac{1}{16}$

b.

**Step 1:** Use the definition of a negative exponent,  $a^{-n} = \frac{1}{a^n}$ .

$$= \frac{1}{10^3}$$

Simplify.  $= \frac{1}{1000}$

## Try It

30) Simplify:

a.  $2^{-3}$

b.  $10^{-7}$

**Solution**

a.  $\frac{1}{8}$

b.  $\frac{1}{10^7}$

31) Simplify:

a.  $3^{-2}$

b.  $10^{-4}$

**Solution**

a.  $\frac{1}{9}$

b.  $\frac{1}{10,000}$

In example 5.2.13 we raised an integer to a negative exponent. What happens when we raise a fraction to a negative exponent? We'll start by looking at what happens to a fraction whose numerator is one and whose denominator is an integer raised to a negative exponent.

Use the definition of a negative exponent,  $a^{-n} = \frac{1}{a^n}$

Simplify the complex fraction.

Multiply.

$$\frac{1}{a^{-n}}$$

$$\frac{1}{\frac{1}{a^n}}$$

$$1 \cdot \frac{a^n}{1}$$

$$a^n$$

This leads to the *Property of Negative Exponents*.

### Property of Negative Exponents

If  $n$  is an integer and  $a \neq 0$ , then  $\frac{1}{a^{-n}} = a^n$ .

#### Example 5.5.15

Simplify:

a.  $\frac{1}{y^{-4}}$

b.  $\frac{1}{3^{-2}}$

**Solution**

a.

**Step 1:** Use the property of a negative exponent,  $\frac{1}{a^{-n}} = a^n$ .

$$y^4$$

---

b.

**Step 1:** Use the property of a negative exponent,  $\frac{1}{a^{-n}} = a^n$ .

$$= 3^2$$

$$\text{Simplify. } = 9$$

## Try It

32) Simplify:

a.  $\frac{1}{p^{-8}}$

b.  $\frac{1}{4^{-3}}$

**Solution**

a.  $p^8$

b. 64

33) Simplify:

a.  $\frac{1}{q^{-7}}$

b.  $\frac{1}{2^{-4}}$

**Solution**

a.  $q^7$

b. 16

Suppose now we have a fraction raised to a negative exponent. Let's use our definition of negative exponents to lead us to a new property.

$$\left(\frac{3}{4}\right)^{-2}$$

Use the definition of a negative exponent,  $a^{-n} = \frac{1}{a^n}$ .

$$\frac{1}{\left(\frac{3}{4}\right)^2}$$

Simplify the denominator.

$$\frac{1}{\frac{9}{16}}$$

Simplify the complex fraction.

$$\frac{16}{9}$$

But we know that  $\frac{16}{9}$  is  $\left(\frac{4}{3}\right)^2$ .

$$\frac{4^2}{3^2}$$

This tells us that:

$$\left(\frac{3}{4}\right)^{-2} = \left(\frac{4}{3}\right)^2$$

To get from the original fraction raised to a negative exponent to the final result, we took the reciprocal of the base—the fraction—and changed the sign of the exponent.

This leads us to the *Quotient to a Negative Power Property*.

### Quotient to a Negative Exponent Property

If  $a$  and  $b$  are real numbers,  $a \neq 0$ ,  $b \neq 0$ , and  $n$  is an integer, then  $\left(\frac{a}{b}\right)^{-n} = \left(\frac{b}{a}\right)^n$ .

#### Example 5.5.16

Simplify:

a.  $\left(\frac{5}{7}\right)^{-2}$

b.  $\left(-\frac{2x}{y}\right)^{-3}$

**Solution**

a.

**Step 1:** Use the Quotient to a Negative Exponent Property,  $\left(\frac{a}{b}\right)^{-n} = \left(\frac{b}{a}\right)^n$ .

**Step 2:** Take the reciprocal of the fraction and change the sign of the exponent.

$$= \left(\frac{7}{5}\right)^2$$

Simplify.  $= \frac{49}{25}$

---

b.

**Step 1:** Use the Quotient to a Negative Exponent Property,  $\left(\frac{a}{b}\right)^{-n} = \left(\frac{b}{a}\right)^n$

**Step 2:** Take the reciprocal of the fraction and change the sign of the exponent.

$$= \left(-\frac{y}{2x}\right)^3$$

Simplify.  $= -\frac{y^3}{8x^3}$

**Try It**

34) Simplify:

a.  $\left(\frac{2}{3}\right)^{-4}$   
 b.  $\left(-\frac{6m}{n}\right)^{-2}$

**Solution**

a.  $\frac{81}{16}$   
 b.  $\frac{n^2}{36m^2}$

35) Simplify:

a.  $\left(\frac{3}{5}\right)^{-3}$   
 b.  $\left(-\frac{a}{2b}\right)^{-4}$

**Solution**

a.  $\frac{125}{27}$   
 b.  $\frac{16b^4}{a^4}$

When simplifying an expression with exponents, we must be careful to correctly identify the base.

### Example 5.5.17

Simplify:

a.  $(-3)^{-2}$   
 b.  $-3^{-2}$

c.  $\left(-\frac{1}{3}\right)^{-2}$

d.  $-\left(\frac{1}{3}\right)^{-2}$

**Solution**

a. Here the exponent applies to the base  $-3$ .

**Step 1: Take the reciprocal of the base and change the sign of the exponent.**

$$= \frac{1}{(-3)^2}$$

Simplify.  $= \frac{1}{9}$

---

b. The expression  $-3^{-2}$  means “find the opposite of  $3^{-2}$ .”

**Step 1: Rewrite as a product with  $-1$ .**

$$-1 \times 3^{-2}$$

---

**Step 2: Take the reciprocal of the base and change the sign of the exponent.**

$$= -1 \cdot \frac{1}{3^2}$$

Simplify.  $= -\frac{1}{9}$

---

c. Here the exponent applies to the base  $-\frac{1}{3}$ .

**Step 1: Take the reciprocal of the base and change the sign of the exponent.**

$$= \left(-\frac{3}{1}\right)^2$$

Simplify.  $= 9$

---

d. The expression  $-\left(\frac{1}{3}\right)^{-2}$  means “find the opposite of  $\left(\frac{1}{3}\right)^{-2}$ .” Here the exponent applies to the base  $\frac{1}{3}$ .

**Step 1: Rewrite as a product with  $-1$ .**

$$-1 \cdot \left(\frac{3}{1}\right)^2$$

**Step 2: Take the reciprocal of the base and change the sign of the exponent.**

$$-9$$

## Try It

36) Simplify:

a.  $(-5)^{-2}$

b.  $-5^{-2}$

c.  $\left(-\frac{1}{5}\right)^{-2}$

d.  $-\left(\frac{1}{5}\right)^{-2}$

**Solution**

a.  $\frac{1}{25}$

b.  $-\frac{1}{25}$

c. 25

d. -25

37) Simplify:

a.  $(-7)^{-2}$

b.  $-7^{-2}$

c.  $\left(-\frac{1}{7}\right)^{-2}$

d.  $\left(-\frac{1}{7}\right)^{-2}$

**Solution**

a.  $\frac{1}{49}$

b.  $-\frac{1}{49}$

c. 49

d. -49

We must be careful to follow the Order of Operations. In the next example, parts (a) and (b) look similar, but the results are different.

### Example 5.5.18

Simplify:

a.  $4 \times 2^{-1}$

b.  $(4 \times 2)^{-1}$

**Solution**

a.

**Step 1: Do exponents before multiplication.**

$$4 \times 2^{-1}$$

**Step 2: Use  $a^{-n} = \frac{1}{a^n}$**

$$= 4 \times \frac{1}{2^1}$$

Simplify.  $= 2$

b.

**Step 1: Simplify inside the parentheses first.**

$$(8)^{-1}$$

**Step 2: Use**  $a^{-n} = \frac{1}{a^n}$ 

$$= \frac{1}{8^1}$$

$$\text{Simplify.} = \frac{1}{8}$$

## Try It

38) Simplify:

a.  $6 \times 3^{-1}$

b.  $(6 \times 3)^{-1}$

**Solution**

a. 2

b.  $\frac{1}{18}$

39) Simplify:

a.  $8 \times 2^{-2}$

b.  $8 \times 2^{-2}$

**Solution**

- a. 2  
b.  $\frac{1}{256}$

When a variable is raised to a negative exponent, we apply the definition the same way we did with numbers. We will assume all variables are non-zero.

### Example 5.5.19

Simplify:

- a.  $x^{-6}$   
b.  $(u^4)^{-3}$

#### Solution

a.

**Step 1:** Use the definition of a negative exponent  $a^{-n} = \frac{1}{a^n}$

$$\frac{1}{x^6}$$

---

b.

**Step 1:** Use the definition of a negative exponent  $a^{-n} = \frac{1}{a^n}$ .

$$= \frac{1}{(u^4)^3}$$

Simplify.  $= \frac{1}{u^{12}}$

## Try It

40) Simplify:

a.  $y^{-7}$

b.  $(z^3)^{-5}$

**Solution**

a.  $\frac{1}{y^7}$

b.  $\frac{1}{z^{15}}$

41) Simplify:

a.  $p^{-9}$

b.  $(q^4)^{-6}$

**Solution**

a.  $\frac{1}{p^9}$

b.  $\frac{1}{q^{24}}$

When there is a product and an exponent we have to be careful to apply the exponent to the correct quantity. According to the Order of Operations, we simplify expressions in parentheses before applying exponents. We'll see how this works in the next example.

### Example 5.5.20

Simplify:

a.  $5y^{-1}$

b.  $(5y)^{-1}$

c.  $(-5y)^{-1}$

**Solution**

a.

**Step 1:** Notice the exponent applies to just the base  $y$ .

**Step 2:** Take the reciprocal of  $y$  and change the sign of the exponent.

$$= 5 \cdot \left( \frac{1}{y^1} \right)$$

$$\text{Simplify.} = \frac{5}{y}$$

---

b.

**Step 1:** Here the parentheses make the exponent apply to the base  $5y$ .

**Step 2:** Take the reciprocal of  $5y$  and change the sign of the exponent.

$$= \frac{1}{5y^1}$$

$$\text{Simplify.} = \frac{1}{5y}$$

---

c.

**Step 1:** The base here is  $-5y$ .

**Step 2:** Take the reciprocal of  $-5y$  and change the sign of the exponent.

$$= \frac{1}{-5y}$$

Simplify.  $= \left(-\frac{1}{5y}\right)$

## Try It

42) Simplify:

a.  $(8p^{-1})$

b.  $(8p)^{-1}$

c.  $(-8p)^{-1}$

**Solution**

a.  $\frac{8}{p}$

b.  $\frac{1}{8p}$

c.  $-\frac{1}{8p}$

43) Simplify:

a.  $11q^{-1}$

b.  $(11q)^{-1}$

c.  $(-11q)^{-1}$

**Solution**

a.  $\frac{1}{11q}$

b.  $\frac{1}{11q}$   
 c.  $-\frac{1}{11q}$

With negative exponents, the Quotient Rule needs only one form  $\frac{a^m}{a^n} = a^{m-n}$ , for  $a \neq 0$ . When the exponent in the denominator is larger than the exponent in the numerator, the exponent of the quotient will be negative.

## Simplify Expressions with Integer Exponents

All of the exponent properties we developed earlier in the chapter with whole number exponents apply to integer exponents, too. We restate them here for reference.

## Summary of Exponent Properties

If  $a$  and  $b$  are real numbers, and  $m$  and  $n$  are integers, then

<b>Product Property</b>	$a^m \times a^n = a^{m+n}$
<b>Power Property</b>	$(a^m)^n = a^{mn}$
<b>Product to a Power</b>	$(ab)^m = a^m b^m$
<b>Quotient Property</b>	$\frac{a^m}{a^n} = a^{m-n}$
<b>Zero Exponent Property</b>	$a^0 = 1, a \neq 0$
<b>Quotient to a Power Property</b>	$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}, b \neq 0$
<b>Properties of Negative Exponents</b>	$a^{-n} = \frac{1}{a^n}$ and $\frac{1}{a^{-n}} = a^n$
<b>Quotient to a Negative Exponent</b>	$\left(\frac{a}{b}\right)^{-n} = \left(\frac{b}{a}\right)^n$

## Example 5.5.21

Simplify:

a.  $x^{-4} \times x^6$

b.  $y^{-6} \times y^4$

c.  $z^{-5} \times z^{-3}$

### Solution

a.

**Step 1: Use the Product Property,  $a^m \cdot a^n = a^{m+n}$**

$$= x^{-4+6}$$

Simplify.  $= x^2$

---

b.

**Step 1: Notice the same bases, so add the exponents.**

$$= y^{-6+4}$$

Simplify.  $= y^{-2}$

**Step 3: Use the definition of a negative exponent,  $a^{-n} = \frac{1}{a^n}$**

$$\frac{1}{y^2}$$

---

c.

**Step 1: Add the exponents, since the bases are the same.**

$$= z^{-5-3}$$

Simplify.  $= z^{-8}$

**Step 3: Take the reciprocal and change the sign of the exponent, using the definition of a negative exponent.**

$$\frac{1}{z^8}$$

## Try It

44) Simplify:

- a.  $x^{-3} \times x^7$
- b.  $y^{-7} \times y^2$
- c.  $z^{-4} \times z^{-5}$

### Solution

- a.  $x^4$
- b.  $\frac{1}{y^5}$
- c.  $\frac{1}{z^9}$

45) Simplify:

- a.  $a^{-1} \times a^6$
- b.  $b^{-8} \times b^4$
- c.  $c^{-8} \times c^{-7}$

### Solution

- a.  $a^5$
- b.  $\frac{1}{b^4}$
- c.  $\frac{1}{c^{15}}$

In the next two examples, we'll start by using the Commutative Property to group the same variables together. This makes it easier to identify the like bases before using the Product Property.

**Example 5.5.22**

Simplify:  $(m^4 n^{-3})(m^{-5} n^{-2})$

**Solution**

**Step 1:** Use the Commutative Property to get like bases together.

$$m^4 m^{-5} n^{-2} n^{-3}$$

**Step 2:** Add the exponents for each base.

$$m^{-1} n^{-5}$$

**Step 3:** Take reciprocals and change the signs of the exponents.

$$\begin{aligned} &= \frac{1}{m^1} \frac{1}{n^5} \\ \text{Simplify. } &= \frac{1}{mn^5} \end{aligned}$$

**Try It**

46) Simplify:  $(p^6 q^{-2})(p^{-9} q^{-1})$

**Solution**

$$\frac{1}{p^3 q^3}$$

47) Simplify:  $(r^5 s^{-3})(r^{-7} s^{-5})$

**Solution**

$$\frac{1}{r^2 s^8}$$

If the monomials have numerical coefficients, we multiply the coefficients, just like we did earlier.

### Example 5.5.23

Simplify:  $(2x^{-6}y^8)(-5x^5y^{-3})$

**Solution**

**Step 1:** Rewrite with the like bases together

$$2(-5)(x^{-6}x^5)(y^8y^{-3})$$

**Step 2:** Multiply the coefficients and add the exponents of each variable.

$$-10x^{-1}y^5$$

**Step 3:** Use the definition of a negative exponent,  $a^{-n} = \frac{1}{a^n}$

$$= -10 \cdot \left( \frac{1}{x^1} \right) \cdot y^5$$

$$\text{Simplify. } = -\frac{10y^5}{x}$$

### Try It

48) Simplify:  $(3u^{-5}v^7)(-4u^4v^{-2})$

**Solution**

$$-\frac{12v^5}{u}$$

49) Simplify:  $(-6c^{-6}d^4)(-5c^{-2}d^{-1})$

**Solution**

$$\frac{30d^3}{c^8}$$

In the next two examples, we'll use the *Power Property* and the *Product to a Power Property*.

**Example 5.5.24**

Simplify:  $(6k^3)^{-2}$

**Solution**

**Step 1: Use the Product to a Power Property,**  $(ab)^m = a^m b^m$

$$(6)^{(-2)} (k^3)^{-2}$$

**Step 2: Use the Power Property,**  $(a^m)^n = a^{mn}$

$$6^{-2} k^{-6}$$

**Step 3: Use the Definition of a Negative Exponent,**  $a^{-n} = \frac{1}{a^n}$

$$= \frac{1}{6^2} \cdot \frac{1}{k^6}$$

$$\text{Simplify. } = \frac{1}{36k^6}$$

## Try It

50) Simplify:  $(-4x^4)^{-2}$

**Solution**

$$\frac{1}{16x^8}$$

51) Simplify:  $(2b^3)^{-4}$

**Solution**

$$\frac{1}{16b^{12}}$$

## Example 5.5.25

Simplify:  $(5x^{-3})^2$

**Solution**

**Step 1:** Use the Product to a Power property,  $(ab)^m = a^m b^m$

$$5^2(x^{-3})^2$$

**Step 2:** Simplify  $5^2$  and multiply the exponents of  $x$  using the Power Property,  $(a^m)^n = a^{mn}$

$$25x^{-6}$$

**Step 3:** Rewrite  $x^{-6}$  by using the Definition of a Negative Exponent,  $a^{-n} = \frac{1}{a^n}$

$$= 25 \cdot \left( \frac{1}{x^6} \right)$$

Simplify.  $= \frac{25}{x^6}$

### Try It

52) Simplify:  $(8a^{-4})^2$

**Solution**

$$\frac{64}{a^8}$$

53) Simplify:  $(2c^{-4})^3$

**Solution**

$$\frac{8}{c^{12}}$$

To simplify a fraction, we use the Quotient Property and subtract the exponents.

### Example 5.5.26

Simplify:  $\frac{r^5}{r^{-4}}$

**Solution**

**Step 1: Use the Quotient Property,**  $\frac{a^m}{a^n} = a^{m-n}$  c

$$= r^{5-(-4)}$$

Simplify.  $= r^9$

## Try It

54) Simplify:  $\frac{x^8}{x^{-3}}$

**Solution**

$$x^{11}$$

55) Simplify:  $\frac{y^8}{y^{-6}}$

**Solution**

$$y^{14}$$

## Divide Monomials

You have now been introduced to all the properties of exponents and used them to simplify expressions. Next, you'll see how to use these properties to divide monomials. Later, you'll use them to divide polynomials.

**Example 5.5.27**

Find the quotient:  $56x^7 \div 8x^3$

**Solution**

**Step 1: Rewrite as a fraction.**

$$\frac{56x^7}{8x^3}$$

**Step 2: Use fraction multiplication.**

$$\frac{56}{8} \times \frac{x^7}{x^3}$$

**Step 3: Simplify and use the Quotient Property.**

$$7x^4$$

**Try It**

56) Find the quotient:  $42y^9 \div 6y^3$

**Solution**

$$7y^6$$

57) Find the quotient:  $48z^8 \div 8z^2$

**Solution**

$$6z^6$$

**Example 5.5.28**

Find the quotient:  $\frac{45a^2b^3}{-5ab^5}$

**Solution**

**Step 1: Use fraction multiplication.**

$$\frac{45}{-5} \cdot \frac{a^2}{a} \cdot \frac{b^3}{b^5}$$

**Step 2: Simplify and use the Quotient Property.**

$$= -9 \cdot a \cdot \frac{1}{b^2}$$

$$\text{Multiply.} \quad = -\frac{9a}{b^2}$$

**Try It**

58) Find the quotient:  $\frac{-72a^7b^3}{8a^{12}b^4}$

**Solution**

$$= -\frac{9}{a^5b}$$

59) Find the quotient:  $\frac{-63c^8d^3}{7c^{12}d^2}$

**Solution**

$$\frac{-9d}{c^4}$$

### Example 5.5.29

Find the quotient:  $\frac{24a^5b^3}{48ab^4}$

**Solution**

**Step 1: Use fraction multiplication.**

$$\frac{24}{48} \cdot \frac{a^5}{a} \cdot \frac{b^3}{b^4}$$

**Step 2: Simplify and use the Quotient Property.**

$$= \frac{1}{2} \cdot a^4 \cdot \frac{1}{b}$$

$$\text{Multiply.} \quad = \frac{a^4}{2b}$$

### Try It

60) Find the quotient:  $\frac{16a^7b^6}{24ab^8}$

**Solution**

$$\frac{2a^6}{3b^2}$$

61) Find the quotient:  $\frac{27p^4q^7}{-45p^{12}q}$

**Solution**

$$-\frac{3q^6}{5p^8}$$

Once you become familiar with the process and have practised it step by step several times, you may be able to simplify a fraction in one step.

### Example 5.5.30

Find the quotient:  $\frac{14x^7y^{12}}{21x^{11}y^6}$

**Solution**

Be very careful to simplify  $\frac{14}{21}$  by dividing out a common factor, and to simplify the variables by subtracting their exponents.

**Step 1: Simplify and use the Quotient Property.**

$$\frac{2y^6}{3x^4}$$

## Try It

62) Find the quotient:  $\frac{28x^5y^{14}}{49x^9y^{12}}$

**Solution**

$$\frac{4y^2}{7x^4}$$

63) Find the quotient:  $\frac{30m^5n^{11}}{48m^{10}n^{14}}$

**Solution**

$$\frac{5}{8m^5n^3}$$

In all examples so far, there was no work to do in the numerator or denominator before simplifying the fraction. In the next example, we'll first find the product of two monomials in the numerator before we simplify the fraction. This follows the order of operations. Remember, a fraction bar is a grouping symbol.

### Example 5.5.31

Find the quotient:  $\frac{(6x^2y^3)(5x^3y^2)}{(3x^4y^5)}$

**Solution**

**Step 1: Simplify the numerator.**

$$= \frac{30x^5y^5}{3x^4y^5}$$

Simplify.  $= 10x$

## Try It

64) Find the quotient:  $\frac{(6a^4b^5)(4a^2b^5)}{12a^5b^8}$

**Solution**

$$2ab^2$$

65) Find the quotient:  $\frac{(-12x^6y^9)(-4x^5y^8)}{-12x^{10}y^{12}}$

**Solution**

$$-4xy^5$$

Access these online resources for additional instruction and practice with dividing monomials:

## Key Concepts

- **Quotient Property for Exponents:**

- If  $a$  is a real number,  $a \neq 0$ , and  $m, n$  are whole numbers, then:

$$\frac{a^m}{a^n} = a^{m-n}, m > n \text{ and } \frac{a^m}{a^n} = \frac{1}{a^{n-m}}, n > m$$

- **Zero Exponent**

- If  $a$  is a non-zero number, then  $a^0 = 1$ .

- **Quotient to a Power Property for Exponents:**

- If  $a$  and  $b$  are real numbers,  $b \neq 0$  and  $m$  is a counting number, then:

$$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}$$

- To raise a fraction to a power, raise the numerator and denominator to that power.

- **Summary of Exponent Properties**

- If  $a, b$  are real numbers and  $m, n$  are whole numbers, then

<b>Product Property</b>	$a^m a^n = a^{m+n}$
<b>Power Property</b>	$(a^m)^n = a^{mn}$
<b>Product to a Power</b>	$(ab)^m = a^m b^m$
<b>Quotient Property</b>	$\frac{a^m}{b^m} = a^{m-n}, a \neq 0, m > n$
	$\frac{a^m}{a^n} = \frac{1}{a^{n-m}}, a \neq 0, n > n = m$
<b>Zero Exponent Definition</b>	$a^0 = 1, a \neq 0$
<b>Quotient to a Power Property</b>	$\left(\frac{a}{b}\right)^m = \frac{a^m}{b^m}, b \neq 0$

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

An interactive H5P element has been excluded from this version of the text. You can view it online here:

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=2842#h5p-30>

On a scale of 1-10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

## 5.6 DIVIDE POLYNOMIALS

### Learning Objectives

By the end of this section, you will be able to:

- Divide a polynomial by a monomial
- Divide a polynomial by a binomial

### Try It

Before you get started, take this readiness quiz:

1) Add:  $\frac{3}{d} + \frac{x}{d}$

2) Simplify:  $\frac{30xy^3}{5xy}$

3) Combine like terms:  $8a^2 + 12a + 1 + 3a^2 - 5a + 4$

### Divide a Polynomial by a Monomial

In the last section, you learned how to divide a monomial by a monomial. As you continue to build up your knowledge of polynomials the next procedure is to divide a polynomial of two or more terms by a monomial.

The method we'll use to divide a polynomial by a monomial is based on the properties of fraction addition. So we'll start with an example to review fraction addition.

$$\frac{y}{5} + \frac{2}{5}$$

The sum simplifies to

$$\frac{y + 2}{5}$$

Now we will do this in reverse to split a single fraction into separate fractions.

We'll state the fraction addition property here just as you learned it and in reverse

### Fraction Addition

If  $a$ ,  $b$  and  $c$  are numbers where  $c \neq 0$ , then

$$\frac{a}{c} + \frac{b}{c} = \frac{a + b}{c} \text{ and } \frac{a + b}{c} = \frac{a}{c} + \frac{b}{c}$$

We use the form on the left to add fractions and we use the form on the right to divide a polynomial by a monomial.

For example,  $\frac{y + 2}{5}$  can be written  $\frac{y}{5} + \frac{2}{5}$

We use this form of fraction addition to divide polynomials by monomials.

### Division of a Polynomial by a Monomial

To divide a polynomial by a monomial, divide each term of the polynomial by the monomial.

**Example 5.6.1**

Find the quotient:  $\frac{7y^2 + 21}{7}$

**Solution**

**Step 1: Divide each term of the numerator by the denominator.**

$$\frac{7y^2}{7} + \frac{21}{7}$$

**Step 2: Simplify each fraction.**

$$y^2 + 3$$

**Try It**

4) Find the quotient:  $\frac{8z^2 + 24}{4}$

**Solution**

$$2z^2 + 6$$

5) Find the quotient:  $\frac{18z^2 - 27}{9}$

**Solution**

$$2z^2 - 3$$

Remember that division can be represented as a fraction. When you are asked to divide a polynomial by a monomial and it is not already in fraction form, write a fraction with the polynomial in the numerator and the monomial in the denominator.

### Example 5.6.2

Find the quotient:  $(18x^3 - 36x^2) \div 6x$

**Solution**

**Step 1: Rewrite as a fraction.**

$$\frac{18x^3 - 36x^2}{6x}$$

**Step 2: Divide each term of the numerator by the denominator.**

$$= \frac{18x^3}{6x} - \frac{36x^2}{6x}$$

$$\text{Simplify.} \quad = 3x^2 - 6x$$

### Try It

6) Find the quotient:  $(27b^3 - 33b^2) \div 3b$

**Solution**

$$9b^2 - 11b$$

7) Find the quotient:  $(25y^3 - 55y^2) \div 5y$

**Solution**

$$5y^2 - 11y$$

When we divide by a negative, we must be extra careful with the signs.

### Example 5.6.3

Find the quotient:  $\frac{12d^2 - 16d}{-4}$

**Solution**

**Step 1: Divide each term of the numerator by the denominator.**

$$\frac{12d^2}{-4} - \frac{16d}{-4}$$

**Step 2: Simplify. Remember, subtracting a negative is like adding a positive!**

$$-3d^2 + 4d$$

### Try It

8) Find the quotient:  $\frac{25y^2 - 15y}{-5}$

**Solution**

$$-5y^2 + 3y$$

9) Find the quotient:  $\frac{42b^2 - 18b}{-6}$

**Solution**

$$-7b^2 + 3b$$

**Example 5.6.4**

Find the quotient:  $\frac{105y^5 + 75y^3}{5y^2}$

**Solution**

**Step 1: Separate the terms.**

$$= \frac{105y^5}{5y^2} + \frac{75y^3}{5y^2}$$

Simplify.  $= 21y^3 + 15y$

**Try It**

10) Find the quotient:  $\frac{60d^7 + 24d^5}{4d^3}$

**Solution**

$$15d^4 + 6d^2$$

11) Find the quotient:  $\frac{216p^7 - 48p^5}{6p^3}$

**Solution**

$$36p^4 - 8p^2$$

### Example 5.6.5

Find the quotient:  $(15x^3y - 35xy^2) \div (-5xy)$

**Solution**

**Step 1: Rewrite as a fraction.**

$$\frac{15x^3y - 35xy^2}{-5xy}$$

**Step 2: Separate the terms.**

$$= \frac{15x^3y}{-5xy} - \frac{35xy^2}{-5xy}$$

$$\text{Simplify. } = -3x^2 + 7y$$

### Try It

12) Find the quotient:  $(32a^2b - 16ab^2) \div (-8ab)$

**Solution**

$$-4a + 2b$$

13) Find the quotient:  $(-48a^8b^4 - 36a^6b^5) \div (-6a^3b^3)$

**Solution**

$$8a^5b + 6a^3b^2$$

**Example 5.6.6**

Find the quotient:  $\frac{36x^3y^2 + 27x^2y^2 - 9x^2y^3}{9x^2y}$

**Solution**

**Step 1: Separate the terms.**

$$= \frac{36x^3y^2}{9x^2y} + \frac{27x^2y^2}{9x^2y} - \frac{9x^2y^3}{9x^2y}$$

Simplify.  $= 4xy + 3y - y^2$

**Try It**

14) Find the quotient:  $\frac{40x^3y^2 + 24x^2y^2 - 16x^2y^3}{8x^2y}$ .

**Solution**

$$5xy + 3y - 2y^2$$

15) Find the quotient:  $\frac{35a^4b^2 + 14a^4b^3 - 42a^2b^4}{7a^2b^2}$

**Solution**

$$5a^2 + 2a^2b - 6b^2$$

**Example 5.6.7**

Find the quotient:  $\frac{10x^2 + 5x - 20}{5x}$

**Solution**

**Step 1: Separate the terms.**

$$= \frac{10x^2}{5x} + \frac{5x}{5x} - \frac{20}{5x}$$

Simplify.  $= 2x + 1 + \frac{4}{x}$

**Try It**

16) Find the quotient:  $\frac{18c^2 + 6c - 9}{6c}$

**Solution**

$$3c + 1 - \frac{3}{2c}$$

17) Find the quotient:  $\frac{10d^2 - 5d - 2}{5d}$

**Solution**

$$2d - 1 - \frac{2}{5d}$$

**Divide a Polynomial by a Binomial**

To divide a polynomial by a binomial, we follow a procedure very similar to long division of numbers. So let's look carefully the steps we take when we divide a 3-digit number, 875, by a 2-digit number, 25.

We write the long division

$$\begin{array}{r} 25 \overline{)875} \end{array}$$

Figure 5.6.1

We divide the first two digits, **87**, by **25**.

$$\begin{array}{r} 3 \\ 25 \overline{)875} \end{array}$$

Figure 5.6.2

We multiply **3** times **25** and write the product under the **87**.

$$\begin{array}{r} 3 \\ 25 \overline{)875} \\ \underline{75} \end{array}$$

Figure 5.6.3

Now we subtract **75** from **87**.

$$\begin{array}{r} 3 \\ 25 \overline{)875} \\ \underline{-75} \\ 12 \end{array}$$

Figure 5.6.4

$$\begin{array}{r} 3 \\ 25 \overline{) 875} \\ \underline{-75} \phantom{0} \\ 125 \end{array}$$

Figure 5.6.5

Then we bring down the third digit of the dividend, 5.

$$\begin{array}{r} 35 \\ 25 \overline{) 875} \\ \underline{-75} \phantom{0} \\ 125 \\ \underline{-125} \\ 0 \end{array}$$

Figure 5.6.6

Repeat the process, dividing 25 into 125.

We check division by multiplying the quotient by the divisor.

If we did the division correctly, the product should equal the dividend.

$$\begin{array}{r} 35 \times 25 \\ 875 \checkmark \end{array}$$

Now we will divide a trinomial by a binomial. As you read through the example, notice how similar the steps are to the numerical example above.

### Example 5.6.8

Find the quotient:  $(x^2 + 9x + 20) \div (x + 5)$

#### Solution

**Step 1: Write it as a long division problem.**

**Step 2: Be sure the dividend is in standard form.**

$$x + 5 \overline{) x^2 + 9x + 20}$$

Figure 5.6.7

**Step 3: Divide  $x^2$  by  $x$ .**

It may help to ask yourself, “What do I need to multiply  $x$  by to get  $x^2$ ?”

**Step 4: Put the answer,  $x$ , in the quotient over the  $x$  term.**

$$\begin{array}{r} x \\ x + 5 \overline{) x^2 + 9x + 20} \end{array}$$

Figure 5.6.8

**Step 5: Multiply  $x$  times  $x + 5$ .**

Line up the like terms under the dividend.

**Step 6: Subtract  $x^2 + 5x$  from  $x^2 + 9x$ .**

$$\begin{array}{r} x \\ x + 5 \overline{) x^2 + 9x + 20} \\ \underline{x^2 + 5x} \phantom{+ 20} \end{array}$$

Figure 5.6.9

**Step 7: Add, changing the signs might make it easier to do this.**

**Step 8: Then bring down the last term, 20.**

$$\begin{array}{r} x \\ x + 5 \overline{) x^2 + 9x + 20} \\ \underline{-x^2 + (-5x)} \phantom{+ 20} \\ 4x + 20 \end{array}$$

Figure 5.6.10

**Step 9: Divide  $4x$  by  $x$ .**

It may help to ask yourself, “What do I need to multiply  $x$  by to get  $4x$ ?”

**Step 10: Put the answer, 4, in the quotient over the constant term.**

$$\begin{array}{r} x + 4 \\ x + 5 \overline{) x^2 + 9x + 20} \\ \underline{-x^2 + (-5x)} \phantom{+ 20} \\ 4x + 20 \end{array}$$

Figure 5.6.11

**Step 11: Multiply 4 times  $x + 5$ .**

$$\begin{array}{r}
 x + 4 \\
 x + 5 \overline{) x^2 + 9x + 20} \\
 \underline{-x^2 + (-5x)} \phantom{+ 20} \\
 4x + 20 \\
 \underline{4x + 20} \\
 0
 \end{array}$$

Figure 5.6.12

**Step 12: Subtract  $4x + 20$  from  $4x + 20$ .**

$$\begin{array}{r}
 x + 4 \\
 x + 5 \overline{) x^2 + 9x + 20} \\
 \underline{-x^2 + (-5x)} \phantom{+ 20} \\
 4x + 20 \\
 \underline{-4x + (-20)} \\
 0
 \end{array}$$

Figure 5.6.13

**Step 13: Check:**

Multiply the quotient by the divisor.

You should get the dividend.

$$\begin{array}{r}
 (x + 4)(x + 5) \\
 x^2 + 9x + 20 \checkmark
 \end{array}$$

## Try It

18) Find the quotient:  $(y^2 + 10y + 21) \div (y + 3)$

**Solution**

$$y + 7$$

19) Find the quotient:  $(m^2 + 9m + 20) \div (m + 4)$

**Solution**

$$m + 5$$

When the divisor has a subtraction sign, we must be extra careful when we multiply the partial quotient and then subtract. It may be safer to show that we change the signs and then add.

### Example 5.6.9

Find the quotient:  $(2x^2 - 5x - 3) \div (x - 3)$

**Solution**

**Step 1: Write it as a long division problem.**

**Step 2: Be sure the dividend is in standard form.**

$$x - 3 \overline{) 2x^2 - 5x - 3}$$

Figure 5.6.14

**Step 3: Divide  $2x^2$  by  $x$ .**

**Step 4: Put the answer,  $2x$ , in the quotient over the  $x$  term.**

$$\begin{array}{r} 2x \\ x - 3 \overline{) 2x^2 - 5x - 3} \end{array}$$

Figure 5.6.15

**Step 5: Multiply  $2x$  times  $x - 3$ .**

Line up the like terms under the dividend.

$$\begin{array}{r} 2x \\ x - 3 \overline{) 2x^2 - 5x - 3} \\ \underline{2x^2 - 6x} \phantom{- 3} \end{array}$$

Figure 5.6.16

**Step 6: Subtract  $2x^2 - 6x$  from  $2x^2 - 5x$ .**

**Step 7: Change the signs and then add.**

**Step 8: Then bring down the last term.**

$$\begin{array}{r}
 2x \\
 x - 3 \overline{) 2x^2 - 5x - 3} \\
 \underline{-2x^2 + 6x} \phantom{-3} \\
 x - 3
 \end{array}$$

Figure 5.6.17

**Step 9: Divide  $x$  by  $x$ .**

**Step 10: Put the answer,  $1$ , in the quotient over the constant term.**

$$\begin{array}{r}
 2x + 1 \\
 x - 3 \overline{) 2x^2 - 5x - 3} \\
 \underline{-2x^2 - (-6x)} \phantom{-3} \\
 x - 3
 \end{array}$$

Figure 5.6.18

**Step 11: Multiply  $1$  times  $x - 3$ .**

$$\begin{array}{r}
 2x + 1 \\
 x - 3 \overline{) 2x^2 - 5x - 3} \\
 \underline{-2x^2 + 6x} \phantom{-3} \\
 x - 3 \\
 \underline{x - 3} \\
 0
 \end{array}$$

Figure 5.6.19

**Step 12: Subtract  $x - 3$  from  $x - 3$  by changing the signs and adding.**

$$\begin{array}{r}
 2x + 1 \\
 x - 3 \overline{) 2x^2 - 5x - 3} \\
 \underline{-2x^2 + 6x} \phantom{-3} \\
 x - 3 \\
 \underline{-x + 3} \\
 0
 \end{array}$$

Figure 5.6.20

**Step 13: To check, multiply  $(x - 3)(2x + 1)$ .**

The result should be  $2x^2 - 5x - 3$ .

## Try It

20) Find the quotient:  $(2x^2 - 3x - 20) \div (x - 4)$

**Solution**

$$2x + 5$$

21) Find the quotient:  $(3x^2 - 16x - 12) \div (x - 6)$

**Solution**

$$3x + 2$$

When we divided 875 by 25, we had no remainder. But sometimes division of numbers does leave a remainder. The same is true when we divide polynomials. In example 5.6.10 we'll have a division that leaves a remainder. We write the remainder as a fraction with the divisor as the denominator.

## Example 5.6.10

Find the quotient:  $(x^3 - x^2 + x + 4) \div (x + 1)$

**Solution**

**Step 1: Write it as a long division problem.**

**Step 2: Be sure the dividend is in standard form.**

$$x + 1 \overline{) x^3 - x^2 + x + 4}$$

Figure 5.6.21

**Step 3: Divide  $x^3$  by  $x$ .**

**Step 4: Put the answer,  $x^2$ , in the quotient over the  $x^2$  term.**

**Step 5: Multiply  $x^2$  times  $x + 1$ .**

Line up the like terms under the dividend.

$$\begin{array}{r} x^2 \\ x+1 \overline{) x^3 - x^2 + x + 4} \\ \underline{x^3 + x^2} \end{array}$$

Figure 5.6.22

**Step 6: Subtract  $x^3 + x^2$  from  $x^3 - x^2$  by changing the signs and adding.**

**Step 7: Then bring down the next term.**

$$\begin{array}{r} x^2 \\ x+1 \overline{) x^3 - x^2 + x + 4} \\ \underline{-x^3 + (-x^2)} \\ -2x^2 + x \end{array}$$

Figure 5.6.23

**Step 9: Divide  $-2x^2$  by  $x$ .**

**Step 10: Put the answer,  $-2x$ , in the quotient over the  $x$  term.**

**Step 11: Multiply  $-2x$  times  $x + 1$ .**

Line up the like terms under the dividend.

$$\begin{array}{r} x^2 - 2x \\ x+1 \overline{) x^3 - x^2 + x + 4} \\ \underline{-x^3 + (-x^2)} \\ -2x^2 + x \\ \underline{-2x^2 - 2x} \end{array}$$

Figure 5.6.24

**Step 12: Subtract  $-2x^2 - 2x$  from  $-2x^2 + x$  by changing the signs and adding.**

**Step 13: Then bring down the last term.**

$$\begin{array}{r}
 x^2 - 2x \\
 x + 1 \overline{) x^3 - x^2 + x + 4} \\
 \underline{-x^3 + (-x^2)} \phantom{+ 4} \\
 -2x^2 + x \phantom{+ 4} \\
 \underline{+2x^2 + 2x} \phantom{+ 4} \\
 3x + 4
 \end{array}$$

Figure 5.6.25

**Step 14:** Divide  $3x$  by  $x$ .

**Step 15:** Put the answer, 3, in the quotient over the constant term.

**Step 16:** Multiply 3 times  $x + 1$ . Line up the like terms under the dividend.

$$\begin{array}{r}
 x^2 - 2x + 3 \\
 x + 1 \overline{) x^3 - x^2 + x + 4} \\
 \underline{-x^3 + (-x^2)} \phantom{+ 4} \\
 -2x^2 + x \phantom{+ 4} \\
 \underline{+2x^2 + 2x} \phantom{+ 4} \\
 3x + 4 \\
 \underline{3x + 3} \\
 1
 \end{array}$$

Figure 5.6.26

**Step 17:** Subtract  $3x + 3$  from  $3x + 4$  by changing the signs and adding.

**Step 18:** Write the remainder as a fraction with the divisor as the denominator.

$$\begin{array}{r}
 x^2 - 2x + 3 + \frac{1}{x + 1} \\
 x + 1 \overline{) x^3 - x^2 + x + 4} \\
 \underline{-x^3 + (-x^2)} \phantom{+ 4} \\
 -2x^2 + x \phantom{+ 4} \\
 \underline{+2x^2 + 2x} \phantom{+ 4} \\
 3x + 4 \\
 \underline{-3x + (-3)} \phantom{+ 4} \\
 1
 \end{array}$$

Figure 5.6.27

**Step 19: To check, multiply**  $(x + 1)(x^2 - 2x + 3 + \frac{1}{x + 1})$ .

The result should be  $x^3 - x^2 + x + 4$

## Try It

22) Find the quotient:  $(x^3 + 5x^2 + 8x + 6) \div (x + 2)$

**Solution**

$$\left(x^2 + 3x + 2 + \frac{2}{x + 2}\right)$$

23) Find the quotient:  $(2x^3 + 8x^2 + x - 8) \div (x + 1)$

**Solution**

$$\left(2x^2 + 6x - 5 - \frac{3}{x + 1}\right)$$

Look back at the dividends in Examples 5.6.8, 5.6.9, and 5.6.10. The terms were written in descending order of degrees, and there were no missing degrees. The dividend in Example 5.6.11 will be  $x^4 - x^2 + 5x - 2$ . It is missing an  $x^3$  term. We will add in  $0x^3$  as a placeholder.

## Example 5.6.11

Find the quotient:  $(x^4 - x^2 + 5x - 2) \div (x + 2)$

**Solution**

Notice that there is no  $x^3$  term in the dividend. We will add  $0x^3$  as a placeholder.

**Step 1: Write it as a long division problem.**

Be sure the dividend is in standard form with placeholders for missing terms.

$$x + 2 \overline{) x^4 - 0x^3 - x^2 + 5x - 2}$$

Figure 5.6.28

**Step 2: Divide  $x^4$  by  $x$ .**

**Step 3: Put the answer,  $x^3$ , in the quotient over the  $x^3$  term.**

**Step 4: Multiply  $x^3$  times  $x + 2$ .**

Line up the like terms.

**Step 5: Subtract and then bring down the next term.**

$$\begin{array}{r} x^3 \\ x + 2 \overline{) x^4 + 0x^3 - x^2 + 5x - 2} \\ \underline{-(x^4 + 2x^3)} \phantom{- x^2 + 5x - 2} \\ -2x^3 - x^2 \phantom{+ 5x - 2} \end{array}$$

It may be helpful to change the signs and add.

Figure 5.6.29

**Step 6: Divide  $-2x^3$  by  $x$ .**

**Step 7: Put the answer,  $-2x^2$ , in the quotient over the  $x^2$  term.**

**Step 8: Multiply  $-2x^2$  times  $x + 1$ .**

Line up the like terms.

**Step 9: Subtract and bring down the next term.**

$$\begin{array}{r} x^3 - 2x^2 \\ x + 2 \overline{) x^4 + 0x^3 - x^2 + 5x - 2} \\ \underline{-(x^4 + 2x^3)} \phantom{- x^2 + 5x - 2} \\ -2x^3 - x^2 \phantom{+ 5x - 2} \\ \underline{-(-2x^3 - 4x^2)} \phantom{+ 5x - 2} \\ 3x^2 + 5x - 2 \end{array}$$

It may be helpful to change the signs and add.

Figure 5.6.30

**Step 10: Divide  $3x^2$  by  $x$ .**

**Step 11: Put the answer,  $3x$ , in the quotient over the  $x$  term.**

**Step 12: Multiply  $3x$  times  $x + 1$ .**

Line up the like terms.

**Step 13: Subtract and bring down the next term.**

$$\begin{array}{r}
 x^3 - 2x^2 + 3x \\
 x + 2 \overline{) x^4 + 0x^3 - x^2 + 5x - 2} \\
 \underline{-(x^4 + 2x^3)} \phantom{- 2x^2 + 5x - 2} \\
 -2x^3 - x^2 \phantom{+ 5x - 2} \\
 \underline{-(-2x^3 - 4x^2)} \phantom{+ 5x - 2} \\
 3x^2 + 5x - 2 \\
 \underline{-(3x^2 + 6x)} \phantom{- 2} \\
 -x - 2
 \end{array}$$

It may be helpful to change the signs and add.

Figure 5.6.31

**Step 14: Divide  $-x$  by  $x$ .**

**Step 15: Put the answer,  $-1$ , in the quotient over the constant term.**

**Step 16: Multiply  $-1$  times  $x + 1$ .**

Line up the like terms.

**Step 17: Change the signs, add.**

$$\begin{array}{r}
 x^3 - 2x^2 + 3x - 1 \\
 x + 2 \overline{) x^4 + 0x^3 - x^2 + 5x - 2} \\
 \underline{-(x^4 + 2x^3)} \phantom{- 2x^2 + 5x - 2} \\
 -2x^3 - x^2 \phantom{+ 5x - 2} \\
 \underline{-(-2x^3 - 4x^2)} \phantom{+ 5x - 2} \\
 3x^2 + 5x - 2 \\
 \underline{-(3x^2 + 6x)} \phantom{- 2} \\
 -x - 2 \\
 \underline{-(-x - 2)} \\
 0
 \end{array}$$

It may be helpful to change the signs and add.

Figure 5.6.32

**Step 18: To check, multiply  $(x + 2)(x^3 - 2x^2 + 3x - 1)$ .**

The result should be  $(x^4 - x^2 + 5x - 2)$

## Try It

24) Find the quotient:  $(x^3 + 3x + 14) \div (x + 2)$

**Solution**

$$x^2 - 2x + 7$$

25) Find the quotient:  $(x^4 - 3x^3 - 1000) \div (x + 5)$

**Solution**

$$x^3 - 8x^2 + 40x - 200$$

In Example 5.6.12, we will divide by  $2a - 3$ . As we divide we will have to consider the constants as well as the variables.

## Example 5.6.12

Find the quotient:  $(8a^3 + 27) \div (2a + 3)$

**Solution**

This time we will show the division all in one step. We need to add two placeholders in order to divide.

$$\begin{array}{r}
 (8a^3 + 27) \div (2a + 3) \\
 \hline
 2a + 3 \overline{) 8a^3 + 0a^2 + 0a + 27} \\
 \underline{-(8a^3 + 12a^2)} \quad \leftarrow 4a^2(2a + 3) \\
 -12a^2 + 0a \\
 \underline{-(-12a^2 - 18a)} \quad \leftarrow 6a(2a + 3) \\
 18a + 27 \\
 \underline{-(18a + 27)} \quad \leftarrow 9(2a + 3) \\
 0
 \end{array}$$

Figure 5.6.33

To check, multiply  $(2a + 3)(4a^2 - 6a + 9)$

The result should be  $8a^3 + 27$

## Try It

26) Find the quotient:  $(x^3 - 64) \div (x - 4)$

**Solution**

$$x^2 + 4x + 16$$

27) Find the quotient:  $(125x^3 - 8) \div (5x - 2)$

**Solution**

$$25x^2 + 10x + 4$$

After reviewing this checklist, what will you do to become confident for all goals?

## 5.7 INTRODUCTION TO GRAPHING POLYNOMIALS

### Learning Objectives

By the end of this section, you will be able to:

- Graph a basic polynomial function of the form  $f(x) = ax^2 + k$ .
- Graph a basic polynomial function of the form  $f(x) = ax^3 + k$ .

In this section, we will focus on graphing simple polynomial functions by identifying some important characteristics and creating a table of values. Polynomial functions can be represented graphically in the rectangular coordinate system, and these graphical representations can allow us to learn about the function visually and better understand the relationship between the variables. Polynomial functions can undergo many transformations to their form, but in this section, we will focus on vertical reflections and translations only.

Please note that the figures created for this section were created using the [desmos](#) graphing calculator. Feel free to use this calculator in your studies to better understand the graph of functions.

### Graphs of Quadratic Equations

Let's examine the general shape of a graph of a general quadratic function  $f(x) = ax^2$ . The graph of a quadratic equation is called a parabola.

In the figure below (Figure 5.7.1), we see the graphs of the functions  $f(x) = x^2$  and  $f(x) = -x^2$ . Notice that the only difference between these two equations is the sign in front of the  $x^2$ . This shows us that the sign of the leading coefficient,  $a$ , determines the direction of opening of a parabola. If the leading coefficient of a quadratic function is positive,  $a > 0$ , the parabola will open upwards, whereas if the leading coefficient of a quadratic function is negative,  $a < 0$ , the parabola will open downwards.

Figure 5.7.1 Comparing the graphs of equations that have undergone a vertical reflection.

## Quadratic Equations Direction of Opening

For a function of the form  $f(x) = ax^2$ ,

if  $a > 0$ , the parabola opens upwards.

if  $a < 0$ , the parabola opens downwards.

Another important characteristic of a parabola is its vertex. Here, we see that the vertex is the origin  $(0, 0)$  regardless of the leading coefficient. In this case, the vertex is also the  $y$ -intercept. When graphing any function, it is always important to find the value of the  $y$ -intercept to use this point in the graphing process. To find the  $y$ -intercept of a function, set the  $x$ -value to zero and evaluate for  $y$ .

Let's examine a couple more graphs of quadratic functions.

This time, the figure below shows  $f(x) = x^2$ ,  $f(x) = 2x^2$  and  $f(x) = \frac{1}{2}x^2$  all in the same Cartesian plane for comparison purposes.

Figure 5.7.2 This figure compares the graphs of quadratic equations that have undergone vertical stretches or compressions.

Graphically, we can see that when the leading coefficient is **2**, the parabola is stretched vertically, whereas when the leading coefficient is  $\frac{1}{2}$ , the parabola has been compressed vertically. This allows us to learn about the nature of a graph of a parabola when the leading coefficient is a value other than **1**. In fact, the absolute value of  $a$  dictates the vertical stretch or compression of the graph of a quadratic equation.

## Quadratic Equations Vertical Stretch or Compression

For a function of the form  $f(x) = ax^2$ ,

if  $|a| > 1$ , the function is stretched by a factor of  $a$ .

if  $|a| < 1$ , the function is compressed by a factor of  $a$ .

Another way to observe the effects of vertical stretches and compressions is in the table of values associated with a particular function. For example, let's compare the table of values for the functions  $f(x) = x^2$  and  $f(x) = 2x^2$ . You will see that the  $y$ -values of the graph of  $f(x) = 2x^2$  have been multiplied by 2 and these values are reflected in Figure 5.7.2.

$x$	$f(x) = x^2$
-2	4
-1	1
0	0
1	1
2	4

$x$	$f(x) = 2x^2$
-2	8
-1	2
0	0
1	2
2	8

Finally, let's examine what happens when we add a vertical translation of  $k$  to the quadratic equation. In the figure below (Figure 5.7.3), we see graphs of the equations  $f(x) = x^2$ ,  $f(x) = x^2 + 2$ , and  $f(x) = x^2 - 2$ .

Figure 5.7.3 Comparing the graphs of equations with a vertical translation.

Graphically, we can see that a vertical translation either moves the parabola up by  $k$  units or down by  $|k|$  units.

Once again, we can also see these transformations within the table of values associated with the given functions. Below, we compare  $f(x) = x^2$  to  $f(x) = x^2 - 2$ . We see that the  $y$ -values have all been reduced by 2. It is also important to notice that the  $y$ -intercept (vertex) was also shifted down by 2 units.

$x$	$f(x) = x^2$
-2	4
-1	1
0	0
1	1
2	4

$x$	$f(x) = x^2 - 2$
$-2$	$2$
$-1$	$-1$
$0$	$-2$
$1$	$-1$
$2$	$2$

### Quadratic Equations Vertical Translation

For a function of the form  $f(x) = ax^2 + k$ ,

if  $k > 0$ , the function is translated up by  $k$  units.

if  $k < 0$ , the function is translated down by  $|k|$  units.

### HOW TO

**Graph a polynomial function of the form  $f(x) = ax^2 + k$ .**

1. Find the direction of opening by observing the sign of  $a$ .
2. Find the  $y$ -intercept, which is also the vertex, by setting  $x = 0$  and evaluating for  $y$ .
3. Make a table of values for  $-2 \leq x \leq 2$ .
4. Plot the vertex and the ordered pairs from the table of values.
5. Join the points by a curve. Be sure to make the curve smooth with no sharp edges or points.
6. Remember the rules of good graphing (label axes, arrows on ends of axes and curves, at least **3** scale markings in each relevant, and original equations labelled).

### Example 5.7.1

Graph the function  $f(x) = -x^2 + 5$ .

**Solution**

**Step 1:** Note that the leading coefficient  $a = -1$ . This means that the parabola will open downwards.

**Step 2:** The  $y$ -intercept can be found by setting  $x = 0$ , and evaluating for the value of the function.

$$\begin{aligned}f(x) &= -x^2 + 5 \\f(0) &= -(0)^2 + 5 \\f(0) &= 5\end{aligned}$$

Therefore, the  $y$ -intercept is the point  $(0, 5)$

**Step 3:** Make a table of values for  $-2 \leq x \leq 2$ .

$x$	$f(x) = -x^2 + 5$
$-2$	$1$
$-1$	$4$
$0$	$5$
$1$	$4$
$2$	$1$

**Step 4:** Plot the vertex and the ordered pairs from the table of values.

**Step 5:** Join the points by a curve. Be sure to make the curve smooth with no sharp edges or points.

Figure 5.7.4

**Step 6:** Remember the rules of good graphing (label axes, arrows on ends of axes and curves, at least 3 scale markings in each relevant, and original equations labelled).

### Example 5.7.2

Graph the function  $f(x) = 2x^2 - 4$ .

#### Solution

**Step 1:** Note that the leading coefficient  $a = 2$ . This means that the parabola will open downwards.

**Step 2:** The  $y$ -intercept can be found by setting  $x = 0$ , and evaluating for the value of the function.

$$f(x) = 2x^2 - 4$$

$$f(0) = 2(0)^2 - 4$$

$$f(0) = -4$$

Therefore, the  $y$ -intercept is the point  $(0, -4)$

**Step 3:** Make a table of values for  $-2 \leq x \leq 2$ .

$x$	$f(x) = 2x^2 - 4$
$-2$	$4$
$-1$	$-2$
$0$	$-4$
$1$	$-2$
$2$	$4$

**Step 4:** Plot the vertex and the ordered pairs from the table of values.

**Step 5:** Join the points by a curve. Be sure to make the curve smooth with no sharp edges or points.

Figure 5.7.5

**Step 6:** Remember the rules of good graphing (label axes, arrows on ends of axes and curves, at least 3 scale markings in each relevant, and original equations labelled).

## Try It

1) Graph the function  $f(x) = -3x^2 + 6$ .

### Solution

Use the [desmos](#) graphing calculator to check your answer.

2) Graph the function  $f(x) = x^2 - 10$ .

**Solution**

Use the [desmos](#) graphing calculator to check your answer.

## Graphs of Cubic Equations

A cubic equation is one that contains a cubed variable term. In this section, we will focus on the graphs of cubic equations of the form  $f(x) = ax^3 + k$ . It is important to note that cubic equations can have graphs that do not have this general shape, but we restrict our focus to cubic equations whose graphs have not undergone any further transformations other than vertical reflections and translations. We will see that changing the leading coefficient and the value of  $k$  will affect the graphs of cubic equations in the same (or similar) way as those transformations affected the graphs of quadratic equations.

Let's begin by comparing the graphs of the equations  $f(x) = x^3$  and  $f(x) = -x^3$ .

Figure 5.7.6 Comparing the graphs of cubic equations that have undergone vertical reflections.

As we can see above, the only difference between the two graphs is their orientation, and the only difference

between the equations is the sign of the leading coefficient,  $a$ . When  $a$  is positive ( $a > 0$ ), the graph increases initially and for all of the values of  $x$ . Contrarily, when  $a$  is negative ( $a < 0$ ), the graph decreases initially and for all of the values of  $x$ . It is important to note that some cubic functions do have intervals of both increase and decrease, but since we are only studying cubic equations of the form  $f(x) = ax^3 + k$ , we will not investigate that case.

### Cubic Equations Direction of Increase or Decrease

For cubic equations of the form  $f(x) = ax^3 + k$ ,

If  $a > 0$ , the function is increasing for all values of  $x$ .

If  $a < 0$ , the function is decreasing for all values of  $x$ .

We can also make note that the  $y$ -intercept of these graphs is the origin,  $(0, 0)$ . In the case of cubic equations of this particular form, the  $y$ -intercept is also the point of inflection. An inflection point is a point where a curve changes its concavity.

Next, we'll examine the graphs  $f(x) = 2x^3$  and  $f(x) = \frac{1}{2}x^3$ , alongside  $f(x) = x^3$  for comparison.

The figure below shows that cubic equations can undergo vertical stretches and compressions in the same way that quadratic equations could.

Figure 5.7.7 Comparing the graphs of cubic equations that have undergone vertical stretches and compressions.

### Cubic Equations Vertical Stretch and Compression

For a function of the form  $f(x) = ax^3$ ,

if  $|a| > 1$ , the function is stretched by a factor of  $a$ .

if  $|a| < 1$ , the function is compressed by a factor of  $a$ .

What do we think would happen if we added a vertical translation to the equation? What might that look like? As was the case with quadratic equations, the graphs of cubic equations behave in the same way when they undergo vertical translations. The following figure show the graphs of  $f(x) = x^3$ ,  $f(x) = x^3 + 2$  and  $f(x) = x^3 - 2$ .

Figure 3.5.8 Comparing the graphs of cubic equations that have undergone vertical translations.

### Cubic Equations Vertical Translation

For a function of the form  $f(x) = ax^3 + k$ ,

if  $k > 0$ , the function is translated up by  $k$  units.

if  $k < 0$ , the function is translated down by  $|k|$  units.

If we were to make a table of values for the cubic equations  $f(x) = x^3$  and  $f(x) = x^3 - 3$ , we would see that the  $y$ -values have been reduced by 3.

$x$	$f(x) = x^3$
-2	-8
-1	-1
0	0
1	1
2	8

$x$	$f(x) = x^3 - 3$
-2	-11
-1	-4
0	-3
1	-2
2	5

## Try It

3) Make a table of values for the functions  $f(x) = x^3$  and  $f(x) = x^3 + 7$  for  $-2 \leq x \leq 2$ . What transformation has occurred?

### Solution

A translation of seven units upwards.

$x$	$f(x) = x^3$
$-2$	$-8$
$-1$	$-1$
$0$	$0$
$1$	$1$
$2$	$8$

$x$	$f(x) = x^3 + 7$
$-2$	$-1$
$-1$	$6$
$0$	$7$
$1$	$8$
$2$	$15$

## HOW TO

**Graph a polynomial function of the form  $f(x) = ax^3 + k$ .**

1. Find the direction of the curve by observing the sign of  $a$ .
2. Find the  $y$ -intercept, which is also the inflection point, by setting  $x = 0$  and evaluating for  $y$ .
3. Make a table of values for  $-2 \leq x \leq 2$ .
4. Plot the  $y$ -intercept and the ordered pairs from the table of values.
5. Join the points by a curve. Be sure to make the curve smooth with no sharp edges or points.
6. Remember the rules of good graphing (label axes, arrows on ends of axes and curves, at

least 3 scale markings in each relevant direction, and original equations labelled).

### Example 5.7.3

Graph the function  $f(x) = -x^3 + 2$ .

#### Solution

**Step 1:** Note that the leading coefficient  $a = -1$ . This means that the graph of the cubic will be decreasing.

**Step 2:** The  $y$ -intercept can be found by setting  $x = 0$ , and evaluating for the value of the function.

$$\begin{aligned} f(x) &= -x^3 + 2 \\ f(0) &= -(0)^3 + 2 \\ f(0) &= 2 \end{aligned}$$

Therefore, the  $y$ -intercept is the point  $(0, 2)$

**Step 3:** Make a table of values for  $-2 \leq x \leq 2$ .

$x$	$f(x) = -x^3 + 2$
-2	10
-1	3
0	2
1	1
2	-6

**Step 4:** Plot the  $y$ -intercept and the ordered pairs from the table of values.

**Step 5:** Join the points by a curve. Be sure to make the curve smooth with no sharp edges or points.

Figure 5.7.9

**Step 6:** Remember the rules of good graphing (label axes, arrows on ends of axes and curves, at least 3 scale markings in each relevant, and original equations labelled).

### Example 5.7.4

Graph the function  $f(x) = 3x^3 - 10$ .

**Solution**

**Step 1:** Note that the leading coefficient  $a = 3$ . This means that the graph of the cubic will be increasing.

**Step 2:** The  $y$ -intercept can be found by setting  $x = 0$ , and evaluating for the value of the function.

$$\begin{aligned} f(x) &= 3x^3 - 10 \\ f(0) &= 3(0)^3 - 10 \\ f(0) &= -10 \end{aligned}$$

Therefore, the  $y$ -intercept is the point  $(0, -10)$ .

**Step 3:** Make a table of values for  $-2 \leq x \leq 2$ .

$x$	$f(x) = 3x^3 - 10$
-2	-34
-1	-13
0	-10
1	-7
2	14

**Step 4:** Plot the  $y$ -intercept and the ordered pairs from the table of values.

**Step 5:** Join the points by a curve. Be sure to make the curve smooth with no sharp edges or points.

Figure 5.7.10

**Step 6:** Remember the rules of good graphing (label axes, arrows on ends of axes and curves, at least 3 scale markings in each relevant, and original equations labelled).

## Try It

4) Graph the function  $f(x) = -2x^3 + 1$ .

### Solution

Use the [desmos](#) graphing calculator to check your answer.

5) Graph the function  $f(x) = x^3 - 4$ .

### Solution

Use the [desmos](#) graphing calculator to check your answer.

## Key Concepts

### 1) Quadratic Equations Direction of Opening

For a function of the form  $f(x) = ax^2$ ,

if  $a > 0$ , the parabola opens upwards;

if  $a < 0$ , the parabola opens downwards.

### 2) Quadratic Equations Vertical Stretch or Compression

For a function of the form  $f(x) = ax^2$ ,

if  $|a| > 1$ , the function is stretched by a factor of  $a$ .

if  $|a| < 1$ , the function is compressed by a factor of  $a$ .

### 3) Quadratic Equations Vertical Translation

For a function of the form  $f(x) = ax^2 + k$ ,

if  $k > 0$ , the function is translated up by  $k$  units.

if  $k < 0$ , the function is translated down by  $|k|$  units.

#### 4) How To Graph a polynomial function of the form $f(x) = ax^2 + k$ .

1. Find the direction of opening by observing the sign of  $a$ .
2. Find the  $y$ -intercept, which is also the vertex, by setting  $x = 0$  and evaluating for  $y$ .
3. Make a table of values for  $-2 \leq x \leq 2$ .
4. Plot the vertex and the ordered pairs from the table of values.
5. Join the points by a curve. Be sure to make the curve smooth with no sharp edges or points.
6. Remember the rules of good graphing (label axes, arrows on ends of axes and curves, at least 3 scale markings in each relevant, and original equations labelled).

#### 5) Cubic Equations Direction of Increase or Decrease

For cubic equations of the form  $f(x) = ax^3 + k$ ,

If  $a > 0$ , the function is increasing for all values of  $x$ .

If  $a < 0$ , the function is decreasing for all values of  $x$ .

#### 6) Cubic Equations Vertical Stretch and Compression

For a function of the form  $f(x) = ax^3$ ,

if  $|a| > 1$ , the function is stretched by a factor of  $a$ .

if  $|a| < 1$ , the function is compressed by a factor of  $a$ .

#### 7) Cubic Equations Vertical Translation

For a function of the form  $f(x) = ax^3 + k$ ,

if  $k > 0$ , the function is translated up by  $k$  units.

if  $k < 0$ , the function is translated down by  $|k|$  units.

#### 8) How To Graph a polynomial function of the form $f(x) = ax^3 + k$ .

1. Find the direction of the curve by observing the sign of  $a$ .
2. Find the  $y$ -intercept, which is also the inflection point, by setting  $x = 0$  and evaluating for  $y$ .
3. Make a table of values for  $-2 \leq x \leq 2$ .
4. Plot the  $y$ -intercept and the ordered pairs from the table of values.

5. Join the points by a curve. Be sure to make the curve smooth with no sharp edges or points.
6. Remember the rules of good graphing (label axes, arrows on ends of axes and curves, at least **3** scale markings in each relevant direction, and original equations labelled).

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=4911#h5p-45>

Overall, after looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

# UNIT 6: GEOMETRY AND TRIGONOMETRY

## Chapter Outline

[6.0 Introduction](#)

[6.1 Use Properties of Angles, Triangles, and the Pythagorean Theorem](#)

[6.2 Use Properties of Rectangles, Triangles, and Trapezoids](#)

[6.3 Solve Geometry Application: Circles and Irregular Figures](#)

[6.4 Solve Geometry Application: Volume and Surface Area](#)

[6.5 Sine, Cosine, and Tangent Ratios and Applications of Trigonometry](#)

[6.6 Unit Sources](#)

## 6.0 INTRODUCTION

---

Figure 6.0.1 Note the many individual shapes in this building. Photo by [Bert Kaufmann CC-BY 4.0](#)

We are surrounded by all sorts of geometry. Architects use geometry to design buildings. Artists create vivid images out of colourful geometric shapes. Street signs, automobiles, and product packaging all take advantage of geometric properties. In this chapter, we will begin by considering a formal approach to solving problems and use it to solve a variety of common problems, including making decisions about money. Then we will explore geometry and relate it to everyday situations, using the problem-solving strategy we develop.

# 6.1 USE PROPERTIES OF ANGLES, TRIANGLES, AND THE PYTHAGOREAN THEOREM

---

## Learning Objectives

By the end of this section, you will be able to:

- Use the properties of angles
- Use the properties of triangles
- Use the Pythagorean Theorem

## Try It

Before you get started, take this readiness quiz:

1) Solve:  $x + 3 + 6 = 11$

2) Solve:  $\frac{a}{45} = \frac{4}{3}$

3) Simplify:  $\sqrt{36 + 64}$

In this unit, we will study geometry and trigonometry in order to develop our understanding of how some of

these tools can help us in a health career. For example, even having a simple understanding of angles will be helpful when performing injections.

Figure 6.1.1

## Use the Properties of Angles

Are you familiar with the phrase ‘do a 180°’? It means to make a full turn so that you face the opposite direction. It comes from the fact that the measure of an angle that makes a straight line is 180 degrees. See Figure 6.1.2.

Figure 6.1.2

An **angle** is formed by two rays that share a common endpoint. Each ray is called a side of the angle and the common endpoint is called the vertex. An angle is named by its vertex. In Figure 6.1.3,  $\angle A$  is the **angle with vertex** at point  $A$ . The measure of  $\angle A$  is written  $m\angle A$ .

$m\angle A$  is the angle with vertex at point  $A$ .

Figure 6.1.3

We measure angles in degrees, and use the symbol  $^\circ$  to represent degrees. We use the abbreviation  $m$  to for the *measure* of an angle. So if  $A$  is  $27^\circ$ , we would write  $m\angle A = 27$ .

If the sum of the measures of two angles is  $180^\circ$  then they are called **supplementary angles**. In Figure 6.1.4, each pair of angles is supplementary because their measures add to  $180^\circ$ . Each angle is the *supplement* of the other.

The sum of the measures of supplementary angles is  $180^\circ$ .

Figure 6.1.4

If the sum of the measures of two angles is  $90^\circ$ , then the angles are complementary angles. In Figure 6.1.5, each pair of angles is complementary, because their measures add to  $90^\circ$ . Each angle is the *complement* of the other.

The sum of the measures of complementary angles is  $90^\circ$ .

Figure 6.1.5

## Supplementary and Complementary Angles

If the *sum* of the measures of two angles is  $180^\circ$  then the angles are *supplementary*.

If  $A$  and  $B$  are supplementary, then  $m\angle A + m\angle B = 180$ .

If the *sum* of the measures of two angles is  $90^\circ$ , then the angles are *complementary*.

If  $A$  and  $B$  are complementary, then  $m\angle A + m\angle B = 90$ .

In this section and the next, you will be introduced to some common geometry formulas. We will adapt our Problem Solving Strategy for Geometry Applications. The geometry formula will name the variables and give us the equation to solve.

In addition, since these applications will all involve geometric shapes, it will be helpful to draw a figure and then label it with the information from the problem. We will include this step in the Problem Solving Strategy for Geometry Applications.

## How To

### Use a *Problem Solving Strategy for Geometry Applications*

1. Read the problem and make sure you understand all the words and ideas. Draw a figure and label it with the given information.
2. Identify what you are looking for.
3. Name what you are looking for and choose a variable to represent it.
4. Translate into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
5. Solve the equation using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

The next example will show how you can use the Problem Solving Strategy for Geometry Applications to answer questions about supplementary and complementary angles.

### Example 6.1.1

An angle measures  $40^\circ$ . Find:

- a. its supplement
- b. its complement

#### Solution

a. **Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.1.6

**Step 2: Identify what you are looking for.**

The supplement of a  $40^\circ$  angle.

**Step 3: Name. Choose a variable to represent it.**

Let  $s$  = the measure of the supplement

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$\begin{aligned} m\angle A + m\angle B &= 180 \\ s + 40 &= 180 \end{aligned}$$

**Step 5: Solve the equation.**

$$s = 140$$

**Step 6: Check.**

$$\begin{aligned} 140 + 40 &\stackrel{?}{=} 180 \\ 180 &= 180 \end{aligned}$$

**Step 7: Answer the question.**

The supplement of the  $40^\circ$  angle is  $140^\circ$ .

b. **Step 1: Read the problem. Draw the figure and label it with the given information**

Figure 6.1.7

**Step 2: Identify what you are looking for.**

The complement of a  $40^\circ$  angle.

**Step 3: Name. Choose a variable to represent it.**

Let  $c$  = the measure of the complement.

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in given information.

$$m\angle A + m\angle B = 90$$

**Step 5: Solve the equation.**

$$\begin{aligned} c + 40 &= 90 \\ c &= 50 \end{aligned}$$

**Step 6: Check.**

$$\begin{aligned} 50 + 40 &\stackrel{?}{=} 90 \\ 90 &= 90 \end{aligned}$$

**Step 7: Answer the question.**

The complement of the  $40^\circ$  angle is  $50^\circ$ .

**Try it**

4) An angle measures  $25^\circ$ . Find its:

- a. supplement
- b. complement

**Solution**

- a.  $155^\circ$
- b.  $65^\circ$

**Try it**

5) An angle measures  $77^\circ$ . Find its:

- a. supplement
- b. complement

**Solution**

- a.  $103^\circ$
- b.  $13^\circ$

Did you notice that the words complementary and supplementary are in alphabetical order just like 90 and 180 are in numerical order?

## Example 6.1.2

Two angles are supplementary. The larger angle is  $30^\circ$  more than the smaller angle. Find the measure of both angles.

### Solution

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.1.8

**Step 2: Identify what you are looking for.**

The measures of both angles.

**Step 3: Name. Choose a variable to represent it.**

Let  $a$  = measure of smaller angle

$a + 30$  = measure of larger angle

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$m\angle A + m\angle B = 180$$

**Step 5: Solve the equation.**

$$(a + 30) + a = 180$$

$$2a + 30 = 180$$

$$2a = 150$$

$$a = 75 \text{ measure of smaller angle}$$

$$a + 30 \text{ measure of larger angle}$$

$$75 + 30 = 105$$

**Step 6: Check.**

$$\begin{aligned}m\angle A + m\angle B &= 180 \\75 + 105 &\stackrel{?}{=} 180 \\180 &= 180\end{aligned}$$

**Step 7: Answer the question.**

The measures of the angles are  $75^\circ$  and  $105^\circ$ .

**Try it**

6) Two angles are supplementary. The larger angle is  $100^\circ$  more than the smaller angle. Find the measures of both angles.

**Solution**

$40^\circ$  and  $140^\circ$

**Try it**

7) Two angles are complementary. The larger angle is  $40^\circ$  more than the smaller angle. Find the measures of both angles.

**Solution**

$25^\circ$  and  $65^\circ$

## Properties of Angles with Parallel Lines

It will be helpful to understand the relationship between parallel lines that are cut by a transversal line and their angles. When two lines are parallel, they will never intersect. We can use this property to find missing angles in various situations.

Figure 6.1.9

In the image above, the lines  $r$  and  $s$  are parallel. We can denote this mathematically using the following notation,  $r \parallel s$ . The line  $t$  is called a transversal line and no matter how it passes through the parallel lines, it will always result in the relationship above.

We notice that angles  $\angle 1$ ,  $\angle 3$ ,  $\angle 5$ , and  $\angle 7$  will all be the same size. Similarly, angles  $\angle 2$ ,  $\angle 4$ ,  $\angle 6$ , and  $\angle 8$  are all the same. Because of these properties, if we are missing certain angles we can find their values if given enough information. Before we do some examples, let's learn some terminology.

**Corresponding angles:** angles that occupy the same relative position. The corresponding angles are:

- $\angle 1$  and  $\angle 5$
- $\angle 2$  and  $\angle 6$
- $\angle 3$  and  $\angle 7$
- $\angle 4$  and  $\angle 8$

**Consecutive angles:** angles that are pairs on the same side and inside the two parallel lines. The consecutive angles are:

- $\angle 3$  and  $\angle 6$
- $\angle 4$  and  $\angle 5$

**Alternate interior angles:** angles that are pairs on opposite sides of the transversal and inside the two parallel lines. The alternate interior angles are:

- $\angle 4$  and  $\angle 6$

$\angle 3$  and  $\angle 5$

**Alternate exterior angles:** angles that are pairs on opposite sides of the transversal and outside the two parallel lines. The alternate exterior angles are:

$\angle 1$  and  $\angle 7$

$\angle 2$  and  $\angle 8$

### Example 6.1.3

If  $r \parallel s$ , and  $\angle 8 = 110^\circ$ , find the value of all of the missing angles.

Figure 6.110

#### Solution

Since  $\angle 8 = 110^\circ$  and  $\angle 8$  and  $\angle 7$  are supplementary angles, then

$\angle 8 + \angle 7 = 180^\circ$  we can solve this equation for the value of  $\angle 7$ .

$$110^\circ + \angle 7 = 180^\circ$$

$$\angle 7 = 180^\circ - 110^\circ$$

$$\angle 7 = 70^\circ$$

Now, since the lines are parallel, and we know the values of  $\angle 8$  and  $\angle 7$ , we can find all the

remaining angles. By our properties,  $\angle 8 = \angle 6 = \angle 4 = \angle 2 = 110^\circ$  and  $\angle 7 = \angle 5 = \angle 3 = \angle 170^\circ$

## Use the Properties of Triangles

What do you already know about triangles? **Triangles** have three sides and three angles. Triangles are named by their vertices. The triangle in Figure 6.1.11 is called  $\triangle ABC$ , read ‘triangle ABC’. We label each side with a lower case letter to match the upper case letter of the opposite vertex.

$\triangle ABC$  has vertices  $A$ ,  $B$ , and  $C$  and sides  $a$ ,  $b$ , and  $c$ .

Figure 6.1.11

The three angles of a triangle are related in a special way. The sum of their measures is  $180^\circ$ .  $m\angle A + m\angle B + m\angle C = 180$ .

## Sum of the Measures of the Angles of a Triangle

For any  $\triangle ABC$ , the sum of the measures of the angles is  $180^\circ$ .  $m\angle A + m\angle B + m\angle C = 180$

### Example 6.1.4

The measures of two angles of a triangle are  $55^\circ$  and  $82^\circ$ . Find the measure of the third angle.

**Solution****Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.1.12

**Step 2: Identify what you are looking for.**

The measure of the third angle in a triangle.

**Step 3: Name. Choose a variable to represent it.**Let  $x$  = measure of the angle.**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$m\angle A + m\angle B + m\angle C = 180$$

**Step 5: Solve the equation.**

$$24 = 13 + x$$

$$11 = x$$

**Step 6: Check.**

$$55 + 82 + 43 \stackrel{?}{=} 180$$

$$180 = 180$$

**Step 7: Answer the question.**The measures of the third angle is **43** degrees.

**Try it**

8) The measures of two angles of a triangle are  $31^\circ$  and  $128^\circ$ . Find the measure of the third angle.

**Solution**

$21^\circ$

**Try it**

9) A triangle has angles of  $49^\circ$  and  $75^\circ$ . Find the measure of the third angle.

**Solution**

$56^\circ$

Because the perimeter of a figure is the length of its boundary, the perimeter of  $\triangle ABC$  is the sum of the lengths of its three sides.

$$P = a + b + c$$

To find the area of a triangle, we need to know its base and height. The height is a line that connects the base to the opposite vertex and makes a  $90^\circ$  angle with the base. We will draw  $\triangle ABC$  again, and now show the height,  $h$ . See Figure 6.1.13.

The formula for the area of  $\triangle ABC$  is  $A = \frac{1}{2}bh$  where  $b$  is the base and  $h$  is the height.

Figure 6.1.13

## Triangle Properties

Figure 6.1.14

For  $\triangle ABC$ :

**Angle measures:**

$$m\angle A + m\angle B + m\angle C = 180$$

- The sum of the measures of the angles of a triangle is  $180^\circ$ .

**Perimeter:**

$$P = a + b + c$$

- The perimeter is the sum of the lengths of the sides of the triangle.

**Area:**

$$A = \frac{1}{2}bh; b=\text{base}, h=\text{height}$$

- The area of a triangle is one-half the base times the height.

### Example 6.1.5

The perimeter of a triangular garden is **24** feet. The lengths of two sides are four feet and nine feet. How long is the third side?

**Solution**

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.1.15

**Step 2: Identify what you are looking for.**

The length of the third side of a triangle.

**Step 3: Name. Choose a variable to represent it.**

Let  $c$  = the third side.

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$P = a + b + c$$

$$P = 4 + 9 + c$$

**Step 5: Solve the equation.**

$$24 = 13 + c$$

$$11 = c$$

**Step 6: Check.**

$$P = a + b + c$$

$$24 \stackrel{?}{=} 4 + 9 + 11$$

$$24 = 24$$

**Step 7: Answer the question.**

The third side is **11** feet long.

**Try it**

10) The perimeter of a triangular garden is **48** feet. The lengths of two sides are **18** feet and **22** feet. How long is the third side?

**Solution**

8 feet

## Try it

11) The lengths of two sides of a triangular window are seven feet and five feet. The perimeter is 18 feet. How long is the third side?

**Solution**

6 feet

## Example 6.1.6

The area of a triangular church window is 90 square meters. The base of the window is 15 meters. What is the window's height?

**Solution**

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.116

**Step 2: Identify what you are looking for.**

The height of a triangle.

**Step 3: Name. Choose a variable to represent it.**

Let  $h$  = the height.

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$A = \frac{1}{2} \times b \times h$$

$$90 = \frac{1}{2} \times 15 \times h$$

**Step 5: Solve the equation.**

$$90 = \frac{15}{2}h$$

$$12 = h$$

**Step 6: Check.**

$$A = \frac{1}{2}bh$$

$$90 \stackrel{?}{=} \frac{1}{2} \times 15 \times 12$$

$$90 = 90$$

**Step 7: Answer the question.**

The height of the triangle is **12** meters.

### Try it

12) The area of a triangular painting is **126** square inches. The base is **18** inches. What is the height?

**Solution**

**14** Inches

### Try it

13) A triangular tent door has area **15** square feet. The height is five feet. What is the base?

**Solution**

**6** feet

## Right Triangles

The triangle properties we used so far apply to all triangles. Now we will look at one specific type of triangle—a **right triangle**. A right triangle has one  $90^\circ$  angle, which we usually mark with a small square in the corner, Figure 6.1.17.

Figure 6.1.17

If we know that a triangle is a right triangle, we know that one angle measures  $90^\circ$  so we only need the measure of one of the other angles in order to determine the measure of the third angle.

### Example 6.1.7

One angle of a right triangle measures  $28^\circ$ . What is the measure of the third angle?

#### Solution

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.1.18

**Step 2: Identify what you are looking for.**

The measure of an angle.

**Step 3: Name. Choose a variable to represent it.**

Let  $x$  = the measure of an angle.

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$m\angle A + m\angle B + m\angle C = 180$$

**Step 5: Solve the equation.**

$$x + 90 + 28 = 180$$

$$x + 118 = 180$$

$$x = 62$$

**Step 6: Check.**

$$180 \stackrel{?}{=} 90 + 28 + 62$$

$$180 = 180$$

**Step 7: Answer the question.**

The measure of the third angle is  $62^\circ$ .

**Try it**

14) One angle of a right triangle measures  $56^\circ$ . What is the measure of the other angle?

**Solution**

$34^\circ$

## Try it

15) One angle of a right triangle measures  $45^\circ$ . What is the measure of the other angle?

### Solution

$45^\circ$

In the examples so far, we could draw a figure and label it directly after reading the problem. In the next example, we will have to define one angle in terms of another. So we will wait to draw the figure until we write expressions for all the angles we are looking for.

## Example 6.1.8

The measure of one angle of a right triangle is  $20^\circ$  more than the measure of the smallest angle. Find the measures of all three angles.

### Solution

**Step 1: Read the problem.**

**Step 2: Identify what you are looking for.**

The measure of all three angles.

**Step 3: Name. Choose a variable to represent it.**

$$\begin{aligned} \text{Let } a &= \text{the } 1^{\text{st}} \text{ angle} \\ a + 20 &= \text{the } 2^{\text{nd}} \text{ angle} \\ 90 &= \text{the } 3^{\text{rd}} \text{ angle (the right angle)} \end{aligned}$$

Now draw the figure and label it with the given information.

Figure 6.1.19

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$\begin{aligned} m\angle A + m\angle B + m\angle C &= 180 \\ a + (a + 20) + 90 &= 180 \end{aligned}$$

**Step 5: Solve the equation.**

$$\begin{aligned} 2a + 110 &= 180 \\ 2a &= 70 \\ a &= 35 \text{ (first angle)} \\ a + 20 &\text{ (second angle)} \\ 35 + 20 &= 55 \\ 90 &\text{ (third angle)} \end{aligned}$$

**Step 6: Check.**

$$\begin{aligned} 35 + 55 + 90 &\stackrel{?}{=} 180 \\ 180 &= 180 \end{aligned}$$

**Step 7: Answer the question.**

The three angles measure  $35^\circ$ ,  $55^\circ$ , and  $90^\circ$ .

### Try it

16) The measure of one angle of a right triangle is  $50^\circ$  more than the measure of the smallest angle. Find the measures of all three angles.

**Solution**

$20^\circ, 70^\circ, 90^\circ$

### Try it

17) The measure of one angle of a right triangle is  $30^\circ$  more than the measure of the smallest angle. Find the measures of all three angles.

**Solution**

$30^\circ, 60^\circ, 90^\circ$

## Similar Triangles

When we use a map to plan a trip, a sketch to build a bookcase, or a pattern to sew a dress, we are working with **similar figures**. In geometry, if two figures have exactly the same shape but different sizes, we say they are similar figures. One is a scale model of the other. The corresponding sides of the two figures have the same ratio, and all their corresponding angles have the same measures.

The two triangles in Figure 6.1.20 are similar. Each side of  $\triangle ABC$  is four times the length of the corresponding side of  $\triangle XYZ$  and their corresponding angles have equal measures.

$\triangle ABC$  and  $\triangle XYZ$  are similar triangles. Their corresponding sides have the same ratio and the corresponding angles have the same measure.

Figure 6.1.20

## Properties of Similar Triangles

If two triangles are similar, then their corresponding angle measures are equal and their corresponding side lengths are in the same ratio.

Figure 6.1.21

The length of a side of a triangle may be referred to by its endpoints, two vertices of the triangle. For example, in  $\triangle ABC$ :

The length  $a$  can also be written  $BC$

The length  $b$  can also be written  $AC$

The length  $c$  can also be written  $AB$

We will often use this notation when we solve similar triangles because it will help us match up the corresponding side lengths.

### Example 6.1.9

$\triangle ABC$  and  $\triangle XYZ$  are similar triangles. The lengths of two sides of each triangle are shown. Find the lengths of the third side of each triangle.

Figure 6.1.22

#### Solution

**Step 1: Read the problem. Draw the figure and label it with the given information.**

The figure is provided.

**Step 2: Identify what you are looking for.**

The length of the sides of similar triangles.

**Step 3: Name. Choose a variable to represent it.**

Let  $a$  = the length of the third side of  $\triangle ABC$ .

Let  $y$  = the length of the third side of  $\triangle XYZ$ .

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

The triangles are similar, so the corresponding sides are in the same ratio. So:

$$\frac{AB}{XY} = \frac{BC}{YZ} = \frac{AC}{XZ}$$

Since the side  $AB = 4$  corresponds to the side  $XY = 3$ , we will use the ratio  $\frac{AB}{XY} = \frac{4}{3}$

to find the other sides.

Be careful to match up the corresponding sides correctly.

$$\text{Sides of large triangle (to find } a\text{):} \quad \frac{AB}{XY} = \frac{BC}{YZ}$$

$$\text{Sides of large triangle (to find } y\text{):} \quad \frac{AB}{XY} = \frac{AC}{XZ}$$

$$\text{Sides of small triangle (to find } a\text{):} \quad \frac{4}{3} = \frac{a}{4.5}$$

$$\text{Sides of small triangle (to find } y\text{):} \quad \frac{4}{3} = \frac{3.2}{y}$$

**Step 5: Solve the equation.**

$$3a = 4(4.5)$$

$$3a = 18$$

$$a = 6$$

$$4y = 3(3.2)$$

$$4y = 9.6$$

$$y = 2.4$$

**Step 6: Check.**

$$\frac{4}{3} \stackrel{?}{=} \frac{6}{4.5}$$

$$4(4.5) \stackrel{?}{=} 6(3)$$

$$18 = 18$$

$$\frac{4}{3} \stackrel{?}{=} \frac{3.2}{2.4}$$

$$4(2.4) \stackrel{?}{=} 3.2(3)$$

$$9.6 = 9.6$$

**Step 7: Answer the question.**

The third side of  $\triangle ABC$  is 6 and the third side of  $\triangle XYZ$  is 2.4.

**Try it**

18)  $\triangle ABC$  is similar to  $\triangle XYZ$ . Find  $a$ .

Figure 6.1.23

**Solution**

8

**Try it**

19)  $\triangle ABC$  is similar to  $\triangle XYZ$ . Find  $y$ .

Figure 6.1.24

**Solution**

22.5

## Use the Pythagorean Theorem

The Pythagorean Theorem is a special property of right triangles that has been used since ancient times. It is named after the Greek philosopher and mathematician Pythagoras who lived around 500 BCE.

Remember that a right triangle has a  $90^\circ$  angle, which we usually mark with a small square in the corner. The side of the triangle opposite the  $90^\circ$  angle is called the hypotenuse, and the other two sides are called the legs. See Figure 6.1.25.

In a right triangle, the side opposite the  $90^\circ$  angle is called the hypotenuse and each of the other sides is called a leg.

Figure 6.1.25

The Pythagorean Theorem tells how the lengths of the three sides of a right triangle relate to each other. It states that in any right triangle, the sum of the squares of the two legs equals the square of the hypotenuse.

## The Pythagorean Theorem

In any right triangle  $ABC$ ,  $a^2 + b^2 = c^2$ .

Where  $c$  is the length of the hypotenuse  $a$  and  $b$  are the lengths of the legs.

Figure 6.1.26

To solve problems that use the Pythagorean Theorem, we will need to find square roots. In [1.6 The Real Numbers](#) we introduced the notation  $\sqrt{m}$  and defined it in this way:

If  $m = n^2$ , then  $\sqrt{m} = n$  for  $n \geq 0$ .

For example, we found that  $\sqrt{25}$  is 5 because  $5^2 = 25$ .

We will use this definition of square roots to solve for the length of a side in a right triangle.

### Example 6.1.10

Use the Pythagorean Theorem to find the length of the hypotenuse.

Figure 6.1.27

**Solution****Step 1: Read the problem.****Step 2: Identify what you are looking for.**

The length of the hypotenuse of the triangle.

**Step 3: Name. Choose a variable to represent it.**Let  $c$  = the length of the hypotenuse.**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$a^2 + b^2 = c^2$$

$$3^2 + 4^2 = c^2$$

**Step 5: Solve the equation.**

$$3a = 4(4.5)$$

$$3a = 18$$

$$a = 6$$

$$4y = 3(3.2)$$

$$4y = 9.6$$

$$y = 2.4$$

**Step 6: Check.**

$$3^2 + 4^2 = 5^2$$

$$9 + 16 \stackrel{?}{=} 25$$

$$25 = 25$$

**Step 7: Answer the question.**

The length of the hypotenuse is 5.

**Try it**

20) Use the Pythagorean Theorem to find the length of the hypotenuse.

Figure 6.1.28

**Solution**

10

**Try it**

21) Use the Pythagorean Theorem to find the length of the hypotenuse.

Figure 6.1.29

**Solution**

17

**Example 6.1.11**

Use the Pythagorean Theorem to find the length of the longer leg.

Figure 6.1.30

**Solution****Step 1: Read the problem.****Step 2: Identify what you are looking for.**

The length of the leg of the triangle.

**Step 3: Name. Choose a variable to represent it.**

Let  $b$  = the leg of the triangle. Label side  $b$ .

Figure 6.1.31

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$a^2 + b^2 = c^2$$

$$5^2 + b^2 = 13^2$$

**Step 5: Solve the equation.**

$$25 + b^2 = 169$$

$$b^2 = 144$$

$$b^2 = \sqrt{144}$$

$$b = 12$$

**Step 6: Check.**

$$5^2 + 12^2 \stackrel{?}{=} 13^2$$

$$25 + 144 \stackrel{?}{=} 169$$

$$169 = 169$$

**Step 7: Answer the question.**

The length of the leg is **12**.

**Try it**

22) Use the Pythagorean Theorem to find the length of the leg.

Figure 6.1.32

**Solution**

8

**Try it**

23) Use the Pythagorean Theorem to find the length of the leg.

Figure 6.1.33

**Solution**

12

**Example 6.1.12**

Kelvin is building a gazebo and wants to brace each corner by placing a 10-inch wooden bracket diagonally as shown. How far below the corner should he fasten the bracket if he wants the distances from the corner to each end of the bracket to be equal? Approximate to the nearest tenth of an inch.

Figure 6.1.34

**Solution****Step 1: Read the problem.**

**Step 2: Identify what you are looking for.**

The distance from the corner that the bracket should be attached.

**Step 3: Name. Choose a variable to represent it.**

Let  $x$  = the distance from the corner.

Figure 6.1.35

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$a^2 + b^2 = c^2$$

$$x^2 + x^2 = 10^2$$

**Step 5: Solve the equation.**

Isolate the variable.

$$2x^2 = 100$$

$$x^2 = 50$$

Use the definition of the square root. Simplify.

$$x = \sqrt{50}$$

Approximate to the nearest tenth.

$$b \approx 7.1$$

**Step 6: Check.**

$$a^2 + b^2 = c^2$$

$$7.1^2 + 7.1^2 \stackrel{?}{\approx} 10^2$$

Yes.

**Step 7: Answer the question.**

Kelvin should fasten each piece of wood approximately **7.1"** from the corner.

## Try it

24) John puts the base of a **13**ft ladder **5** feet from the wall of his house. How far up the wall does the ladder reach?

Figure 6.1.36

### Solution

**12** feet

## Try it

25) Randy wants to attach a **17** ft string of lights to the top of the **15** ft mast of his sailboat. How far from the base of the mast should he attach the end of the light string?

Figure 6.1.37

**Solution**

8 feet

**ACCESS ADDITIONAL ONLINE RESOURCES**

- [Animation: The Sum of the Interior Angles of a Triangle](#)
- [Similar Polygons](#)
- [Example: Determine the Length of the Hypotenuse of a Right Triangle](#)

**Key Concepts**

- **Supplementary and Complementary Angles**

- If the sum of the measures of two angles is  $180^\circ$ , then the angles are supplementary.
- If  $\angle A$  and  $\angle B$  are supplementary, then  $m\angle A + m\angle B = 180$ .
- If the sum of the measures of two angles is  $90^\circ$ , then the angles are complementary.

- If  $\angle A$  and  $\angle B$  are complementary, then  $m\angle A + m\angle B = 90$ .

- **Solve Geometry Applications**

1. Read the problem and make sure you understand all the words and ideas. Draw a figure and label it with the given information.
2. Identify what you are looking for.
3. Name what you are looking for and choose a variable to represent it.
4. Translate into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
5. Solve the equation using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

- **Sum of the Measures of the Angles of a Triangle**

Figure 6.1.38

- For any  $\triangle ABC$ , the sum of the measures is  $180^\circ$ .
- $m\angle A + m\angle B + m\angle C = 180$ .

- **Right Triangle**

Figure 6.1.39

- A right triangle is a triangle that has one  $90^\circ$  angle.

- **Properties of Similar Triangles**

- If two triangles are similar, then their corresponding angle measures are equal and their corresponding side lengths have the same ratio.

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=6531#h5p-37>

What does this checklist tell you about your mastery of this section? What steps will you take to improve?

## Glossary

### angle

An angle is formed by two rays that share a common endpoint. Each ray is called a side of the angle.

### complementary angles

If the sum of the measures of two angles is  $90^\circ$ , then they are called complementary angles.

**hypotenuse**

The side of the triangle opposite the  $90^\circ$  angle is called the hypotenuse.

**legs of a right triangle**

The sides of a right triangle adjacent to the right angle are called the legs.

**right triangle**

A right triangle is a triangle that has one  $90^\circ$  angle.

**similar figures**

In geometry, if two figures have exactly the same shape but different sizes, we say they are similar figures.

**supplementary angles**

If the sum of the measures of two angles is  $180^\circ$ , then they are called supplementary angles.

**triangle**

A triangle is a geometric figure with three sides and three angles.

**vertex of an angle**

When two rays meet to form an angle, the common endpoint is called the vertex of the angle.

## 6.2 USE PROPERTIES OF RECTANGLES, TRIANGLES, AND TRAPEZOIDS

---

### Learning Objectives

By the end of this section, you will be able to:

- Understand linear, square, and cubic measure
- Use properties of rectangles
- Use properties of triangles
- Use properties of trapezoids

### Try It

Before you get started, take this readiness quiz:

- 1) The length of a rectangle is **3** less than the width. Let  $w$  represent the width. Write an expression for the length of the rectangle.
- 2) Simplify:  $\frac{1}{2}(6h)$
- 3) Simplify:  $\frac{5}{2}(10.3 - 7.9)$

In this section, we'll continue working with geometry applications. We will add some more properties of triangles, and we'll learn about the properties of rectangles and trapezoids.

## Understand Linear, Square, and Cubic Measure

When you measure your height or the length of a garden hose, you use a ruler or tape measure Figure 6.2.1. A tape measure might remind you of a line—you use it for linear measure, which measures length. Inch, foot, yard, mile, centimetre and meter are units of linear measure.

This tape measure measures inches along the top and centimetres along the bottom.

Figure 6.2.1

When you want to know how much tile is needed to cover a floor, or the size of a wall to be painted, you need to know the **area**, a measure of the region needed to cover a surface. Area is measured in square units. We often use square inches, square feet, square centimetres, or square miles to measure area. A square centimetre is a square that is one centimetre (cm) on each side. A square inch is a square that is one inch on each side Figure 6.2.2.

Square measures have sides that are each 1 unit in length.

Figure 6.2.2

Figure 6.2.3 shows a rectangular rug that is 2 feet long by 3 feet wide. Each square is 1 foot wide by 1 foot long, or 1 square foot. The rug is made of 6 squares. The area of the rug is 6 square feet.

The rug contains six squares of 1 square foot each, so the total area of the rug is 6 square feet.

Figure 6.2.3

When you measure how much it takes to fill a container, such as the amount of gasoline that can fit in a tank, or the amount of medicine in a syringe, you are measuring volume. Volume is measured in cubic units such as cubic inches or cubic centimetres. When measuring the volume of a rectangular solid, you measure how many cubes fill the container. We often use cubic centimetres, cubic inches, and cubic feet. A cubic centimetre is a cube that measures one centimetre on each side, while a cubic inch is a cube that measures one inch on each side Figure 6.2.4.

Cubic measures have sides that are 1 unit in length.

Figure 6.2.4

Suppose the cube in Figure 6.2.5 measures **3** inches on each side and is cut on the lines shown. How many little cubes does it contain? If we were to take the big cube apart, we would find **27** little cubes, with each one measuring one inch on all sides. So each little cube has a volume of **1** cubic inch, and the volume of the big cube is **27** cubic inches.

A cube that measures **3** inches on each side is made up of **27** one-inch cubes, or **27** cubic inches.

Figure 6.2.5

### Example 6.2.1

For each item, state whether you would use linear, square, or cubic measure:

- a. amount of carpeting needed in a room
- b. extension cord length
- c. amount of sand in a sandbox
- d. length of a curtain rod
- e. amount of flour in a canister
- f. size of the roof of a doghouse.

**Solution**

a. You are measuring how much surface the carpet covers, which is the area.	square measure
b. You are measuring how long the extension cord is, which is the length.	linear measure
c. You are measuring the volume of the sand.	cubic measure
d. You are measuring the length of the curtain rod.	linear measure
e. You are measuring the volume of the flour.	cubic measure
f. You are measuring the area of the roof.	square measure

## Try It

4) Determine whether you would use linear, square, or cubic measure for each item.

- a. amount of paint in a can
- b. height of a tree
- c. floor of your bedroom
- d. diameter of bike wheel
- e. size of a piece of sod
- f. amount of water in a swimming pool

### Solution

- a. cubic
- b. linear
- c. square
- d. linear
- e. square
- f. cubic

5) Determine whether you would use linear, square, or cubic measure for each item.

- a. volume of a packing box
- b. size of patio
- c. amount of medicine in a syringe
- d. length of a piece of yarn
- e. size of housing lot
- f. height of a flagpole

### Solution

- a. cubic
- b. square
- c. cubic
- d. linear
- e. square
- f. linear

Many geometry applications will involve finding the **perimeter** or the area of a figure. There are also many applications of perimeter and area in everyday life, so it is important to make sure you understand what they each mean.

Picture a room that needs new floor tiles. The tiles come in squares that are a foot on each side—one square foot. How many of those squares are needed to cover the floor? This is the area of the floor.

Next, think about putting new baseboard around the room, once the tiles have been laid. To figure out how many strips are needed, you must know the distance around the room. You would use a tape measure to measure the number of feet around the room. This distance is the perimeter.

## Perimeter and Area

The perimeter is a measure of the distance around a figure.

The area is a measure of the surface covered by a figure

Figure 6.2.6 shows a square tile that is **1** inch on each side. If an ant walked around the edge of the tile, it would walk **4** inches. This distance is the perimeter of the tile.

Since the tile is a square that is **1** inch on each side, its area is one square inch. The area of a shape is measured by determining how many square units cover the shape.

$$\text{Perimeter} = 4\text{inches}$$

$$\text{Area} = 1\text{square inch}$$

When the ant walks completely around the tile on its edge, it is tracing the perimeter of the tile. The area of the tile is **1** square inch.

Figure 6.2.6

### Example 6.2.2

Each of two square tiles is **1** square inch. Two tiles are shown together.

- What is the perimeter of the figure?
- What is the area?

Figure 6.2.7

#### Solution

- The perimeter is the distance around the figure. The perimeter is **6** inches.
- The area is the surface covered by the figure. There are **2** square inch tiles so the area is **2** square inches.

Figure 6.2.8

## Try It

6) Find the: a. perimeter and b. area of the figure:

Figure 6.2.9

### Solution

a. 8 inches

b. 3 sq. inches

7) Find the: a. perimeter b. area of the figure

Figure 6.2.10

### Solution

a. 8 centimetres

b. 4 sq. centimetres

## Use the Properties of Rectangles

A **rectangle** has four sides and four right angles. The opposite sides of a rectangle are the same length. We refer to one side of the rectangle as the length,  $L$ , and the adjacent side as the width,  $W$ . See Figure 6.2.11.

A rectangle has four sides, and four right angles. The sides are labelled  $L$  for length and  $W$  for width.

Figure 6.2.11

The perimeter,  $P$ , of the rectangle is the distance around the rectangle. If you started at one corner and walked around the rectangle, you would walk  $L + W + L + W$  units, or two lengths and two widths. The perimeter then is

$$P = L + W + L + W \text{ or}$$

$$P = 2L + 2W$$

What about the area of a rectangle? Remember the rectangular rug from the beginning of this section. It was 2 feet long by 3 feet wide, and its area was 6 square feet. See Figure 6.2.13. Since  $A = 2 \times 3$  we see that the area,  $A$ , is the length,  $L$ , times the width,  $W$ , so the area of a rectangle is  $A = L \times W$

The area of this rectangular rug is 6 square feet, its length times its width.

Figure 6.2.12

## Properties of Rectangles

- Rectangles have four sides and four right  $90^\circ$  angles.
- The lengths of opposite sides are equal.
- The perimeter,  $P$ , of a rectangle is the sum of twice the length and twice the width. See Figure 6.2.11.

$$P = 2L + 2W.$$

- The area,  $A$ , of a rectangle is the length times the width.

$$A = L \times W$$

For easy reference as we work the examples in this section, we will restate the Problem Solving Strategy for Geometry Applications here.

## HOW TO

### Use a Problem Solving Strategy for Geometry Applications

1. Read the problem and make sure you understand all the words and ideas. Draw the figure and label it with the given information.
2. Identify what you are looking for.
3. Name what you are looking for. Choose a variable to represent that quantity.
4. Translate into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
5. Solve the equation using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

**Example 6.2.3**

The length of a rectangle is **32** meters and the width is **20** meters. Find a. the perimeter b. the area

**Solution**

a. **Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.2.13

**Step 2: Identify what you are looking for.**

The perimeter of a rectangle.

**Step 3: Name. Choose a variable to represent it.**

Let  $P$  = the perimeter.

**Step 4: Translate.**

Write the appropriate formula. Substitute.

$$P = 2L + 2W$$

$$P = 2(32) + 2(20)$$

**Step 5: Solve the equation.**

$$P = 64 + 40$$

$$P = 104$$

**Step 6: Check.**

$$\begin{aligned}
 P &\stackrel{?}{=} 104 \\
 20 + 32 + 20 + 32 &\stackrel{?}{=} 104 \\
 104 &\stackrel{?}{=} 104
 \end{aligned}$$

**Step 7: Answer the question.**

The perimeter of the rectangle is **104** meters.

**b.Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.2.14

**Step 2: Identify what you are looking for.**

The area of a rectangle

**Step 3: Name. Choose a variable to represent it.**

Let  $A$  = the area.

**Step 4: Translate.**

Write the appropriate formula. Substitute.

$$\begin{aligned}
 A &= L \times W \\
 A &= 32m \times 20m
 \end{aligned}$$

**Step 5: Solve the equation.**

$$A = 640$$

**Step 6: Check.**

$$\begin{array}{r}
 A \stackrel{?}{=} 640 \\
 32 \times 20 \stackrel{?}{=} 640 \\
 640 \stackrel{?}{=} 640
 \end{array}$$

**Step 7: Answer the question.**

The area of the rectangle is **60** square meters.

## Try It

8) The length of a rectangle is **120** yards and the width is **50** yards. Find a. the perimeter and b. the area.

**Solution**

- a. 340 yd
- b. 6000 sq. yd

9) The length of a rectangle is **62** feet and the width is **48** feet. Find a. the perimeter and b. the area.

**Solution**

- a. 220 ft
- b. 2976 sq. ft

## Example 6.2.4

Find the length of a rectangle with perimeter **50** inches and width **10** inches.

**Solution****Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.2.15

**Step 2: Identify what you are looking for.**

The length of the rectangle.

**Step 3: Name. Choose a variable to represent it.**Let  $L$  = the length.**Step 4: Translate.**

Write the appropriate formula. Substitute.

$$P = 2L + 2W$$

$$50 = 2L + 2(10)$$

**Step 5: Solve the equation.**

$$50 - 20 = 2L + 20 - 20$$

$$30 = 2L$$

$$\frac{30}{2} = \frac{2L}{2}$$

$$15 = L$$

**Step 6: Check.**

$$P = 50$$

$$15 + 10 + 15 + 10 \stackrel{?}{=} 50$$

$$50 = 50 \checkmark$$

**Step 7: Answer the question.**The length is **15** inches.

## Try It

10) Find the length of a rectangle with a perimeter of 80 inches and width of 25 inches.

**Solution**

15 in.

11) Find the length of a rectangle with a perimeter of 30 yards and width of 6 yards.

**Solution**

9 yd

In the next example, the width is defined in terms of the length. We'll wait to draw the figure until we write an expression for the width so that we can label one side with that expression.

## Example 6.2.5

The width of a rectangle is two inches less than the length. The perimeter is **52** inches. Find the length and width.

**Solution**

**Step 1: Read the problem.**

**Step 2: Identify what you are looking for.**

The length of the rectangle.

**Step 3: Name. Choose a variable to represent it.**

Since the width is defined in terms of the length, we let  $L$  = length. The width is two feet less than the length, so we let width ( $W$ ) =  $L - 2$ .

Now we can create a visual to represent it.

Figure 6.2.16

**Step 4: Translate.**

Write the appropriate formula. The formula for the perimeter of a rectangle relates all the information. Substitute in the given information.

$$P = 2L + 2W$$

$$52 = 2L + 2(L - 2)$$

**Step 5: Solve the equation.**

Combine like terms.

$$52 = 2L + 2(L - 2)$$

$$52 = 2L + 2L - 4$$

$$52 = 4L - 4$$

Add 4 to each side.

$$4 + 52 = 4L - 4 + 4$$

$$56 = 4L - \cancel{4} + 4$$

Divide by 4 and solve.

$$\frac{56}{4} = \frac{4L}{4}$$

$$\frac{56}{4} = \frac{\cancel{4}L}{\cancel{4}}$$

$$\frac{56}{4} = L$$

$$14 = L$$

**Step 6: Find the width.**

$$W = L - 2$$

$$W = 14 - 2$$

$$W = 12$$

**Step 7: Check.**

$$P = 2L + 2W$$

$$52 = 2(14) + 2(12)$$

$$52 = 28 + 24$$

$$52 = 52 \checkmark$$

**Step 8: Answer the question.**

The length is **14** feet and the width is **12** feet.

## Try It

12) The width of a rectangle is seven meters less than the length. The perimeter is 58 meters. Find the length and width.

**Solution**

18 m, 11 m

13) The length of a rectangle is eight feet more than the width. The perimeter is 60 feet. Find the length and width.

**Solution**

11 ft, 19 ft

### Example 6.2.6

The length of a rectangle is four centimetres more than twice the width. The perimeter is **32** centimetres. Find the length and width.

**Solution**

**Step 1: Read the problem.**

**Step 2: Identify what you are looking for.**

The length and width.

**Step 3: Name. Choose a variable to represent it. Then draw a diagram to show what we are solving for.**

Let  $W$  = width. The length is four more than twice the width.  $2w + 4$  = length.

Figure 6.2.17

**Step 4: Translate.**

Write the appropriate formula and substitute in the given information.

$$P = 2L + 2W$$

$$32 = 2(2W + 4) + 2W$$

**Step 5: Solve the equation.**

$$32 = 2(2W + 4) + 2W$$

$$32 = 4W + 8 + 2W$$

$$32 = 6W + 8$$

$$24 = 6W$$

$$4 = W$$

$$2W + 4 = \text{length}$$

$$2(4) + 4 = \text{length}$$

$$12 = \text{length}$$

**Step 6: Check.**

$$P = 2L + 2W$$

$$32 \stackrel{?}{=} 2 \times 12 + 2 \times 4$$

$$32 = 32 \checkmark$$

**Step 7: Answer the question.**

The length is **12** cm and the width is **4** cm.

## Try It

14) The length of a rectangle is eight more than twice the width. The perimeter is 64 feet. Find the length and width.

**Solution**

8 ft, 24 ft

15) The width of a rectangle is six less than twice the length. The perimeter is 18 centimetres. Find the length and width.

**Solution**

5 cm, 4 cm

**Example 6.2.7**

The area of a rectangular room is **168** square feet. The length is **14** feet. What is the width?

Figure 6.2.18

**Solution**

**Step 1: Read the problem.**

**Step 2: Identify what you are looking for.**

The width of a rectangular room

**Step 3: Name. Choose a variable to represent it.**

Let  $W$  = width.

**Step 4: Translate.**

Write the appropriate formula and substitute in the given information.

$$\begin{aligned} A &= LW \\ 168 &= 14W \end{aligned}$$

**Step 5: Solve the equation.**

$$\begin{aligned} \frac{168}{14} &= \frac{14W}{14} \\ 12 &= W \end{aligned}$$

**Step 6: Check.**

$$\begin{aligned} A &= LW \\ 168 &\stackrel{?}{=} 14 \times 12 \\ 168 &= 168 \checkmark \end{aligned}$$

**Step 7: Answer the question.**

The width of the room is **12** feet.

## Try It

16) The area of a rectangle is 598 square feet. The length is 23 feet. What is the width?

**Solution**

26 ft

17) The width of a rectangle is 21 meters. The area is 609 square meters. What is the length?

**Solution**

29 m

## Example 6.2.8

Find the length of a rectangle with perimeter **50** inches and width **10** inches.

**Solution**

**Step 1: Read the problem. Draw the figure and label it with the given information.**

$$P = 50 \text{ inches.}$$

Figure 6.2.19

**Step 2: Identify what you are looking for.**

The length of the rectangle.

**Step 3: Name. Choose a variable to represent it.**

Let  $L$  = the length.

**Step 4: Translate.**

Write the appropriate formula and substitute in the given information.

$$\begin{aligned} P &= 2L + 2W \\ 50 &= 2L + 2(10) \end{aligned}$$

**Step 5: Solve the equation.**

$$\begin{aligned} 50 - 20 &= 2L + 20 - 20 \\ 30 &= 2L \\ \frac{30}{2} &= \frac{2L}{2} \\ 15 &= L \end{aligned}$$

**Step 6: Check.**

$$\begin{aligned} 15 + 10 + 15 + 10 &\stackrel{?}{=} 50 \\ 50 &= 50 \checkmark \end{aligned}$$

**Step 7: Answer the question.**

The length is **15** inches.

## Try It

18) Find the length of a rectangle with: perimeter 80 and width 25.

**Solution**

15

19) Find the length of a rectangle with: perimeter 30 and width 6.

**Solution**

**Example 6.2.9**

The perimeter of a rectangular swimming pool is **150** feet. The length is **15** feet more than the width. Find the length and width.

**Solution**

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.2.20

**Step 2: Identify what you are looking for.**

The length and width of the pool.

**Step 3: Name. Choose a variable to represent it.**

Let  $W$  = width.

Let  $W + 15$  = length.

**Step 4: Translate.**

Write the appropriate formula and substitute in the given information.

$$P = 2L + 2W$$

$$150 = 2(W + 15) + 2W$$

**Step 5: Solve the equation.**

$$150 = 2W + 30 + 2W$$

$$150 = 4W + 30$$

$$120 = 4W$$

$$30 = W \text{ (the width of the pool)}$$

$$W + 15 = \text{length of pool}$$

$$30 + 15 = L$$

$$45 = L$$

**Step 6: Check.**

$$P = 2L + 2W$$

$$150 \stackrel{?}{=} 2(45) + 2(30)$$

$$150 = 150 \checkmark$$

**Step 7: Answer the question.**

The length of the pool is **45** feet and the width is **30** feet.

## Try It

20) The perimeter of a rectangular swimming pool is 200 feet. The length is 40 feet more than the width. Find the length and width.

**Solution**

30 ft, 70 ft

21) The length of a rectangular garden is 30 yards more than the width. The perimeter is 300 yards. Find the length and width.

**Solution**

60 yd, 90 yd

## Use the Properties of Triangles

We now know how to find the area of a rectangle. We can use this fact to help us visualize the formula for the area of a triangle. In the rectangle in Figure 6.2.21, we've labelled the length  $b$  and the width  $h$ , so its area is  $bh$ .

The area of a rectangle is the base,  $b$ , times the height,  $h$ .

Figure 6.2.21

We can divide this rectangle into two congruent triangles Figure 6.2.22. Triangles that are congruent have identical side lengths and angles, and so their areas are equal. The area of each triangle is one-half the area of the rectangle, or  $\frac{1}{2}bh$ . This example helps us see why the formula for the area of a triangle is  $A = \frac{1}{2}bh$ .

A rectangle can be divided into two triangles of equal area. The area of each triangle is one-half the area of the rectangle.

Figure 6.2.22

The formula for the area of a triangle is  $A = \frac{1}{2}bh$ , where  $b$  is the base and  $h$  is the height.

To find the area of the triangle, you need to know its base and height. The base is the length of one side of the triangle, usually the side at the bottom. The height is the length of the line that connects the base to the opposite vertex, and makes a  $90^\circ$  angle with the base. Figure 6.2.23 shows three triangles with the base and height of each marked.

The height  $h$  of a triangle is the length of a line segment that connects the the base to the opposite vertex and makes a  $90^\circ$  angle with the base.

Figure 6.2.23

## Triangle Properties

For any triangle  $\triangle ABC$ , the sum of the measures of the angles is  $180^\circ$ .

$$m\angle A + m\angle B + m\angle C = 180^\circ$$

The perimeter of a triangle is the sum of the lengths of the sides.

$$P = a + b + c$$

The area of a triangle is one-half the base,  $b$ , times the height,  $h$ .

$$A = \frac{1}{2}bh$$

Figure 6.2.24

### Example 6.2.10

Find the area of a triangle whose base is **11** inches and whose height is **8** inches.

#### Solution

**Step 1:** Read the problem. Draw the figure and label it with the given information.

Figure 6.2.25

**Step 2: Identify what you are looking for.**

The area of the triangle.

**Step 3: Name. Choose a variable to represent it.**

Let  $A$  = area of the triangle.

**Step 4: Translate.**

Write the appropriate formula and substitute in the given information.

$$A = \frac{1}{2} \times b \times h$$

$$A = \frac{1}{2} \times 11 \times 8$$

**Step 5: Solve the equation.**

$$A = 44 \text{ square inches}$$

**Step 6: Check.**

$$A = \frac{1}{2}bh$$

$$44 \stackrel{?}{=} \frac{1}{2} (11)8$$

$$44 = 44 \checkmark$$

**Step 7: Answer the question.**

The area is **44** square inches.

## Try It

22) Find the area of a triangle with base 13 inches and height 2 inches.

**Solution**

13 sq. in.

23) Find the area of a triangle with base 14 inches and height 7 inches.

**Solution**

49 sq. in.

## Example 6.2.11

The perimeter of a triangular garden is **24** feet. The lengths of two sides are **4** feet and **9** feet. How long is the third side?

**Solution**

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.2.26

**Step 2: Identify what you are looking for.**

The length of the third side of a triangle.

**Step 3: Name. Choose a variable to represent it.**

Let  $c$  = the third side.

**Step 4: Translate.**

Write the appropriate formula and substitute in the given information.

$$P = a + b + c$$

$$P = 4 + 9 + c$$

**Step 5: Solve the equation.**

$$24 = 13 + c$$

$$11 = c$$

**Step 6: Check.**

$$P = a + b + c$$

$$24 \stackrel{?}{=} 4 + 9 + 11$$

$$24 = 24 \checkmark$$

**Step 7: Answer the question.**

The third side is **11** feet long.

**Try It**

24) The perimeter of a triangular garden is 24 feet. The lengths of two sides are 18 feet and 22 feet. How long is the third side?

**Solution**

8 ft

25) The lengths of two sides of a triangular window are 7 feet and 5 feet. The perimeter is 18 feet. How long is the third side?

**Solution**

6 ft

**Example 6.2.12**

The area of a triangular church window is **90** square meters. The base of the window is **15** meters. What is the window's height?

**Solution**

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.2.27

**Step 2: Identify what you are looking for.**

The height of a triangle.

**Step 3: Name. Choose a variable to represent it.**

Let  $h$  = the height.

**Step 4: Translate.**

Write the appropriate formula and substitute in the given information.

$$A = \frac{1}{2} \times b \times h$$

$$90 = \frac{1}{2} \times 15 \times h$$

**Step 5: Solve the equation.**

$$90 = \frac{15}{2}h$$

$$12 = h$$

**Step 6: Check.**

$$A = \frac{1}{2}bh$$

$$90 \stackrel{?}{=} \frac{1}{2} \times 15 \times 12$$

$$90 = 90 \checkmark$$

**Step 7: Answer the question.**

The height of the triangle is **12** meters.

## Try It

26) The area of a triangular painting is 126 square inches. The base is 18 inches. What is the height?

**Solution**

14 in.

27) A triangular tent door has an area of 15 square feet. The height is 5 feet. What is the base?

**Solution**

6 ft

## Isosceles and Equilateral Triangles

Besides the right triangle, some other triangles have special names. A triangle with two sides of equal length is called an **isosceles triangle**. A triangle that has three sides of equal length is called an **equilateral triangle**. Figure 6.2.28 shows both types of triangles.

In an isosceles triangle, two sides have the same length, and the third side is the base. In an equilateral triangle, all three sides have the same length.

Figure 6.2.28

### Isosceles and Equilateral Triangles

An isosceles triangle has two sides the same length.

An equilateral triangle has three sides of equal length.

#### Example 6.2.13

The perimeter of an equilateral triangle is **93** inches. Find the length of each side.

**Solution****Step 1: Read the problem. Draw the figure and label it with the given information.**

Perimeter = 93 in.

Figure 6.2.29

**Step 2: Identify what you are looking for.**

The length of the sides of an equilateral triangle.

**Step 3: Name. Choose a variable to represent it.**Let  $s$  = length of each side.**Step 4: Translate.**

Write the appropriate formula and substitute in the given information.

$$P = a + b + c$$

$$93 = s + s + s$$

**Step 5: Solve the equation.**

$$93 = 3s$$

$$31 = s$$

**Step 6: Check.**

$$93 \stackrel{?}{=} 31 + 31 + 31$$

$$93 = 93 \checkmark$$

**Step 7: Answer the question.**Each side is **31** inches.

## Try It

28) Find the length of each side of an equilateral triangle with perimeter 39 inches.

**Solution**

13 in.

29) Find the length of each side of an equilateral triangle with perimeter 51 centimetres.

**Solution**

17 cm

## Example 6.2.14

Arianna has **156** inches of beading to use as trim around a scarf. The scarf will be an isosceles triangle with a base of **60** inches. How long can she make the two equal sides?

**Solution**

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.2.30

**Step 2: Identify what you are looking for.**

The lengths of the two equal sides.

**Step 3: Name. Choose a variable to represent it.**

Let  $s$  = the length of each side.

**Step 4: Translate.**

Write the appropriate formula and substitute in the given information.

$$P = a + b + c$$

$$156 = s + 60 + s$$

**Step 5: Solve the equation.**

$$156 = 2s + 60$$

$$90 = 2s$$

$$48 = s$$

**Step 6: Check.**

$$P = a + b + c$$

$$156 \stackrel{?}{=} 48 + 60 + 48$$

$$156 = 156 \checkmark$$

**Step 7: Answer the question.**

Arianna can make each of the two equal sides **48** inches long.

**Try It**

30) A backyard deck is in the shape of an isosceles triangle with a base of 20 feet. The perimeter of the deck is 48 feet. How long is each of the equal sides of the deck?

**Solution**

14 ft

31) A boat's sail is an isosceles triangle with base of 8 meters. The perimeter is 22 meters. How long is each of the equal sides of the sail?

**Solution**

7 m

## Use the Properties of Trapezoids

A **trapezoid** is a four-sided figure, a *quadrilateral*, with two sides that are parallel and two sides that are not. The parallel sides are called the bases. We call the length of the smaller base  $b$ , and the length of the bigger base  $B$ . The height,  $h$ , of a trapezoid is the distance between the two bases as shown in Figure 6.2.31

A trapezoid has a larger base,  $B$ , and a smaller base,  $b$ . The height  $h$  is the distance between the bases.

Figure 6.2.31

**The formula for the area of a trapezoid is:**

$$Area_{trapezoid} = \frac{1}{2}(b + B)$$

Splitting the trapezoid into two triangles may help us understand the formula. The area of the trapezoid is the sum of the areas of the two triangles. See Figure 6.2.32.

Splitting a trapezoid into two triangles may help you understand the formula for its area.

Figure 6.2.32

The height of the trapezoid is also the height of each of the two triangles. See Figure 6.2.33.

Figure 6.2.33

**The formula for the area of a trapezoid is**

$$\text{Area}_{\text{trapezoid}} = \frac{1}{2}bh + \frac{1}{2}Bh$$

$$\text{Area}_{\text{trapezoid}} = A_{\text{blue}\Delta} + A_{\text{red}\Delta}$$

Figure 6.2.34

If we distribute, we get,

$$\text{Area}_{\text{trapezoid}} = \frac{1}{2}bh + \frac{1}{2}Bh$$

$$\text{Area}_{\text{trapezoid}} = A_{\text{blue}\Delta} + A_{\text{red}\Delta}$$

Figure 6.2.35

## Properties of Trapezoids

- A trapezoid has four sides. See Figure 6.2.31
- Two of its sides are parallel and two sides are not.
- The area,  $A$ , of a trapezoid is  $A = \frac{1}{2}h(b + B)$ .

### Example 6.2.15

Find the area of a trapezoid whose height is **6** inches and whose bases are **14** and **11** inches.

#### Solution

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.2.36

**Step 2: Identify what you are looking for.**

The area of the trapezoid.

**Step 3: Name. Choose a variable to represent it.**

Let  $A$  = the area.

**Step 4: Translate.**

Write the appropriate formula and substitute in the given information.

$$A = \frac{1}{2} \times b \times h$$

$$A = \frac{1}{2} \times 6 \times (11 + 14)$$

**Step 5: Solve the equation.**

$$1A = \frac{1}{2} \times 6(25)$$

$$A = 3(25)$$

$$A = 75 \text{ sq. inches}$$

**Step 6: Check.**

Is this answer reasonable?

The area of the larger rectangle is **84** square inches and the area of the smaller rectangle is **66** square inches.

So it makes sense that the area of the trapezoid is between **84** and **66** square inches

**Step 7: Answer the question.**

The area of the trapezoid is **75** square inches.

## Try It

32) The height of a trapezoid is 14 yards and the bases are 7 and 16 yards. What is the area?

**Solution**

161 sq. yd

33) The height of a trapezoid is 18 centimetres and the bases are 17 and 8 centimetres. What is the area?

**Solution**

225 sq. cm

## Example 6.2.16

Find the area of a trapezoid whose height is 5 feet and whose bases are 10.3 and 13.7 feet.

**Solution**

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.2.37

**Step 2: Identify what you are looking for.**

The area of the trapezoid.

**Step 3: Name. Choose a variable to represent it.**

Let  $A$  = the area.

**Step 4: Translate.**

Write the appropriate formula and substitute in the given information.

$$A = \frac{1}{2} \times h \times (b + B)$$

$$A = \frac{1}{2} \times 5 \times (10.3 + 13.7)$$

**Step 5: Solve the equation.**

$$1A = \frac{1}{2} \times 5(24)$$

$$A = 12 \times 5$$

$$A = 60 \text{ sq. ft}$$

Figure 6.2.38

**Step 6: Check: Is this answer reasonable?**

The area of the trapezoid should be less than the area of a rectangle with base **13.7** and height **5**, but more than the area of a rectangle with base **10.3** and height **5**.

**Step 7: Answer the question.**

The area of the trapezoid is **60** square feet.

## Try It

34) The height of a trapezoid is 7 centimetres and the bases are 4.6 and 7.4 centimetres. What is the area?

**Solution**

42 sq. cm

35) The height of a trapezoid is 9 meters and the bases are 6.2 and 7.8 meters. What is the area?

**Solution**

63 sq. m

## Example 6.2.17

Vinny has a garden that is shaped like a trapezoid. The trapezoid has a height of **3.4** yards and the bases are **8.2** and **5.6** yards. How many square yards will be available to plant?

**Solution**

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.2.39

**Step 2: Identify what you are looking for.**

The area of a trapezoid.

**Step 3: Name. Choose a variable to represent it.**

Let  $A$  = the area.

**Step 4: Translate.**

Write the appropriate formula and substitute in the given information.

$$A = \frac{1}{2} \times b \times (b + B)$$

$$A = \frac{1}{2} \times 3.4 \times (5.6 + 8.2)$$

**Step 5: Solve the equation.**

$$A = \frac{1}{2}(3.4)(13.8)$$

$$A = 23.46 \text{ sq. yards}$$

$A_{\text{rectangle}} = Bh$ $= (8.2)(3.4)$ $= 27.88 \text{ yd}^2$	$A_{\text{trapezoid}} = \frac{1}{2}(3.4 \text{ yd})(5.6 + 8.2)$ $= 23.46 \text{ yd}^2$	$A_{\text{rectangle}} = bh$ $= (5.6)(3.4)$ $= 19.04 \text{ yd}^2$		
$A_{\text{rectangle}}$ <b>27.88</b>	$>$	$A_{\text{trapezoid}}$ <b>23.46</b>	$>$	$A_{\text{rectangle}}$ <b>19.04</b>

**Step 6: Check: Is this answer reasonable?**

Yes. The area of the trapezoid is less than the area of a rectangle with a base of **8.2** yd and height **3.4** yd, but more than the area of a rectangle with base **5.6** yd and height **3.4** yd.

**Step 7: Answer the question.**

Vinny has **23.46** square yards in which he can plant.

## Try It

36) Lin wants to sod his lawn, which is shaped like a trapezoid. The bases are 10.8 yards and 6.7 yards, and the height is 4.6 yards. How many square yards of sod does he need?

**Solution**

40.25 sq. yd

37) Kira wants cover his patio with concrete pavers. If the patio is shaped like a trapezoid whose bases are 18 feet and 14 feet and whose height is 15 feet, how many square feet of pavers will he need?

**Solution**

240 sq. ft

## Key Concepts

### • Properties of Rectangles

- Rectangles have four sides and four right ( $90^\circ$ ) angles.
- The lengths of opposite sides are equal.
- The perimeter,  $P$ , of a rectangle is the sum of twice the length and twice the width.

$$\cdot P = 2L + 2W$$

- The area,  $A$ , of a rectangle is the length times the width.

$$\cdot A = L \times W$$

### • Triangle Properties

- For any triangle  $\triangle ABC$ , the sum of the measures of the angles is  $180^\circ$ .

$$\cdot m\angle A + m\angle B + m\angle C = 180^\circ$$

- The perimeter of a triangle is the sum of the lengths of the sides.

$$\cdot P = a + b + c$$

- The area of a triangle is one-half the base,  $b$ , times the height,  $h$ .

$$\cdot A = \frac{1}{2}bh$$

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=6623#h5p-39>

On a scale of 1–10, how would you rate your mastery of this section in light of your responses on the checklist? How can you improve this?

## Glossary

### **area**

The area is a measure of the surface covered by a figure.

### **equilateral triangle**

A triangle with all three sides of equal length is called an equilateral triangle.

### **isosceles triangle**

A triangle with two sides of equal length is called an isosceles triangle.

### **perimeter**

The perimeter is a measure of the distance around a figure.

### **rectangle**

A rectangle is a geometric figure that has four sides and four right angles.

### **trapezoid**

A trapezoid is a four-sided figure, a quadrilateral, with two sides that are parallel and two sides that are not.

## 6.3 SOLVE GEOMETRY APPLICATIONS: CIRCLES AND IRREGULAR FIGURES

---

### Learning Objectives

By the end of this section, you will be able to:

- Use the properties of circles
- Find the area of irregular figures

### Try It

Before you get started, take this readiness quiz:

- 1) Evaluate  $x^2$  when  $x = 5$ .
- 2) Using **3.14** for  $\pi$ , approximate the (a) circumference and (b) the area of a circle with radius 8 inches.
- 3) Simplify  $\frac{22}{7}(0.25)^2$  and round to the nearest thousandth.

In this section, we'll continue working with geometry applications. We will add several new formulas to our collection of formulas. To help you as you do the examples and exercises in this section, we will show the Problem Solving Strategy for Geometry Applications here.

## HOW TO

### Problem Solving Strategy for Geometry Applications

1. Read the problem and make sure you understand all the words and ideas. Draw the figure and label it with the given information.
2. Identify what you are looking for.
3. Name what you are looking for. Choose a variable to represent that quantity.
4. Translate into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
5. Solve the equation using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

## Use the Properties of Circles

Do you remember the properties of circles from Decimals and Fractions Together? We'll show them here again to refer to as we use them to solve applications.

### Properties of Circles

Figure 6.3.1

- $r$  is the length of the radius
- $d$  is the length of the diameter
- $d = 2r$

- Circumference is the perimeter of a circle. The formula for circumference is  $C = 2\pi r$
- The formula for area of a circle is  $A = \pi r^2$

Remember, that we approximate  $\pi$  with 3.14 or  $\frac{22}{7}$  depending on whether the radius of the circle is given as a decimal or a fraction. If you use the  $\pi$  key on your calculator to do the calculations in this section, your answers will be slightly different from the answers shown. That is because the  $\pi$  key uses more than two decimal places. On assessments, we will always give specific instructions on whether to use the approximations above or not.

### Example 6.3.1

A circular sandbox has a radius of 2.5 feet. Find the:

- circumference
- area of the sandbox

#### Solution

- Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.3.2

#### **Step 2: Identify what you are looking for.**

The circumference of the circle.

#### **Step 3: Name. Choose a variable to represent it.**

Let  $c$  = the circumference of the circle.

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$C = 2\pi r$$

$$C = 2\pi(2.5)$$

**Step 5: Solve the equation.**

$$C \approx 2(3.14)(2.5)$$

$$C \approx 15.7$$

**Step 6: Check. Does this answer make sense?**

Yes. If we draw a square around the circle, its sides would be 5 ft (twice the radius), so its perimeter would be 20 ft. This is slightly more than the circle's circumference, 15.7 ft.

Figure 6.3.3

**Step 7: Answer the question.**

The circumference of the sandbox is 15.7 feet.

---

b. **Step 1: Read the problem. Draw the figure and label it with the given information**

Figure 6.3.4

**Step 2: Identify what you are looking for.**

The area of the circle.

**Step 3: Name. Choose a variable to represent it.**

Let  $A$  = the area of the circle.

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$A = \pi r^2$$

$$A = \pi(2.5)^2$$

**Step 5: Solve the equation.**

$$A \approx (3.14)(2.5)^2$$

$$A \approx 19.625 \text{ sq. ft}$$

**Step 6: Check. Does this answer make sense?**

Yes. If we draw a square around the circle, its sides would be 5 ft, as shown in part a.. So the area of the square would be 25 sq. ft. This is slightly more than the circle's area, 19.625 sq. ft.

**Step 7: Answer the question.**

The area of the circle is 19.625 square feet.

## Try It

4) A circular mirror has radius of **5** inches. Find the a. circumference and b. area of the mirror.

### Solution

a. **31.4** in.

b. **78.5** sq. in.

## Try It

5) A circular spa has radius of **4.5** feet. Find the a. circumference and b. area of the spa.

### Solution

a. **28.26** ft

b. **63.585** sq. ft

We usually see the formula for circumference in terms of the radius  $r$  of the circle:  $C = 2\pi r$

But since the diameter of a circle is two times the radius, we could write the formula for the circumference in terms  $d$ .

Using the Commutative Property, we get:

$$C = 2\pi r$$

$$C = \pi 2r$$

Then, substituting  $d = 2r$ :  $C = \pi d$

We will use this form of the circumference when we're given the length of the diameter instead of the radius.

### Example 6.3.2

A circular table has a diameter of four feet. What is the circumference of the table?

**Solution**

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.3.5

**Step 2: Identify what you are looking for.**

The circumference of the table.

**Step 3: Name. Choose a variable to represent it.**

Let  $c$  = the circumference of the table.

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$C = \pi d$$

$$C = \pi(4)$$

**Step 5: Solve the equation, using 3.14 for  $\pi$ .**

$$C \approx (3.14)(4)$$

$$C \approx 12.56 \text{ feet}$$

**Step 6: Check.**

If we put a square around the circle, its side would be **4**. The perimeter would be **16**. It makes sense that the circumference of the circle, **12.56**, is a little less than **16**.

Figure 6.3.6

**Step 7: Answer the question.**

The diameter of the table is **12.56** square feet.

## Try It

6) Find the circumference of a circular fire pit whose diameter is **5.5** feet.

**Solution**

**17.27** ft

## Try It

7) If the diameter of a circular trampoline is **12** feet, what is its circumference?

**Solution**

**37.68 ft**

## Example 6.3.3

Find the diameter of a circle with a circumference of **47.1** centimetres.

**Solution**

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.3.7

**Step 2: Identify what you are looking for.**

The diameter of the circle.

**Step 3: Name. Choose a variable to represent it.**

Let  $d$  = the diameter of the circle.

**Step 4: Translate.**

Write the formula, using 3.14 for  $\pi$ .

$$C = \pi d$$

$$C = \pi(4)$$

**Step 5: Solve the equation.**

$$C \approx (3.14)(4)$$

$$C \approx 12.56 \text{ feet}$$

**Step 6: Check.**

$$C = \pi d$$

$$47.1 \stackrel{?}{=} (3.14)(15)$$

$$47.1 = 47.1$$

**Step 7: Answer the question.**

The diameter of the circle is approximately **15** centimetres.

## Try It

8) Find the diameter of a circle with circumference of **94.2** centimetres.

**Solution**

30 cm

## Try It

9) Find the diameter of a circle with circumference of **345.4** feet.

**Solution**

110 ft

## Find the Area of Irregular Figures

So far, we have found area for rectangles, triangles, trapezoids, and circles. An **irregular figure** is a figure that is not a standard geometric shape. Its area cannot be calculated using any of the standard area formulas. But some irregular figures are made up of two or more standard geometric shapes. To find the area of one of these irregular figures, we can split it into figures whose formulas we know and then add the areas of the figures.

### Example 6.3.4

Find the area of the shaded region.

Figure 6.3.8

**Solution**

The given figure is irregular, but we can break it into two rectangles. The area of the shaded region will be the sum of the areas of both rectangles.

Figure 6.3.9

The blue rectangle has a width of **12** and a length of **4**. The red rectangle has a width of **2**, but its length is not labelled. The right side of the figure is the length of the red rectangle plus the length of the blue rectangle. Since the right side of the blue rectangle is **4** units long, the length of the red rectangle must be **6** units.

Figure 6.3.10

$$\begin{aligned}
 A_{\text{figure}} &= A_{\text{blue rectangle}} + A_{\text{red rectangle}} \\
 A_{\text{figure}} &= bh + bh \\
 A_{\text{figure}} &= 12 \times 4 + 2 \times 6 \\
 A_{\text{figure}} &= 48 + 12 \\
 A_{\text{figure}} &= 60
 \end{aligned}$$

The area of the figure is **60** square units.

Is there another way to split this figure into two rectangles? Try it, and make sure you get the same area.

## Try It

10) Find the area of each shaded region:

Figure 6.3.11

**Solution**

28 sq. units

**Try It**

11) Find the area of each shaded region:

Figure 6.3.12

**Solution**

110 sq. units

**Example 6.3.5**

Find the area of the shaded region.

Figure 6.3.13

**Solution**

We can break this irregular figure into a triangle and rectangle. The area of the figure will be the sum of the areas of triangle and rectangle.

The rectangle has a length of 8 units and a width of 4 units.

We need to find the base and height of the triangle.

Since both sides of the rectangle are 4, the vertical side of the triangle is 3, which is  $7 - 4$ .

The length of the rectangle is 8, so the base of the triangle will be 3, which is  $8 - 5$ .

Figure 6.3.14

Now we can add the areas to find the area of the irregular figure.

$$A_{\text{Figure}} = A_{\text{rectangle}} + A_{\text{triangle}}$$

$$A_{\text{Figure}} = lw + \frac{1}{2}bh$$

$$A_{\text{Figure}} = 8 \times 4 + \frac{1}{2} \times 3 \times 3$$

$$A_{\text{Figure}} = 32 + 4.5$$

$$A_{\text{Figure}} = 36.4 \text{ sq. units}$$

The area of the figure is **36.5** square units.

## Try It

12) Find the area of each shaded region.

Figure 6.3.15

## Solution

36.5 sq. units

## Try It

13) Find the area of each shaded region.

Figure 6.3.16

### Solution

70 sq. units

## Example 6.3.6

A high school track is shaped like a rectangle with a semi-circle (half a circle) on each end. The rectangle has length **105** meters and width **68** meters. Find the area enclosed by the track. Round your answer to the nearest hundredth.

Figure 6.3.17

**Solution**

We will break the figure into a rectangle and two semi-circles. The area of the figure will be the sum of the areas of the rectangle and the semicircles.

Figure 6.3.18

The rectangle has a length of 105m and a width of 68m. The semi-circles have a diameter of 68m, so each has a radius of 34m.

$$A_{Figure} = A_{rectangle} + A_{semicircles}$$

$$A_{Figure} = bh + 2\left(\frac{1}{2}\pi \times r^2\right)$$

$$A_{Figure} \approx 105 \times 68 + \left(\frac{1}{2} \times 3.14 \times 34^2\right)$$

$$A_{Figure} \approx 7140 + 3629.84$$

$$A_{Figure} \approx 10,769.84$$

The area enclosed is 10,769.84 square meters.

## Try It

14) Find the area:

Figure 6.3.19

## Solution

103.2 sq. units

## Try It

15) Find the area:

Figure 6.3.20

**Solution**

38.24 sq. units

**Access Additional Online Resources**

- [Circumference of a Circle](#)

## Key Concepts

- **Problem Solving Strategy for Geometry Applications**

1. Read the problem and make sure you understand all the words and ideas. Draw the figure and label it with the given information.
2. Identify what you are looking for.
3. Name what you are looking for. Choose a variable to represent that quantity.
4. Translate into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
5. Solve the equation using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

- **Properties of Circles**

Figure 6.3.21

- $d = 2r$
- **Circumference:**  $C = 2\pi r$  or  $C = \pi d$
- **Area:**  $A = \pi r^2$

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=6679#h5p-40>

After looking at the checklist, do you think you are well prepared for the next section? Why or why not?

## Glossary

### **irregular figure**

An irregular figure is a figure that is not a standard geometric shape. Its area cannot be calculated using any of the standard area formulas.

## 6.4 SOLVE GEOMETRY APPLICATIONS: VOLUME AND SURFACE AREA

---

### Learning Objectives

By the end of this section, you will be able to:

- Find volume and surface area of rectangular solids
- Find volume and surface area of spheres
- Find volume and surface area of cylinders
- Find volume of cones

### Try It

Before you get started, take this readiness quiz:

- 1) Evaluate  $x^3$  when  $x = 5$ .
- 2) Evaluate  $2^x$  when  $x = 5$ .
- 3) Find the area of a circle with radius  $\frac{7}{2}$ .

In this section, we will finish our study of geometry applications. We find the volume and surface area of some

three-dimensional figures. Since we will be solving applications, we will once again show our Problem-Solving Strategy for Geometry Applications.

## HOW TO

### Problem Solving Strategy for Geometry Applications

1. Read the problem and make sure you understand all the words and ideas. Draw the figure and label it with the given information.
2. Identify what you are looking for.
3. Name what you are looking for. Choose a variable to represent that quantity.
4. Translate into an equation by writing the appropriate formula or model for the situation. Substitute in the given information.
5. Solve the equation using good algebra techniques.
6. Check the answer in the problem and make sure it makes sense.
7. Answer the question with a complete sentence.

## Find Volume and Surface Area of Rectangular Solids

A cheerleading coach is having the squad paint wooden crates with the school colours to stand on at the games. (See Figure 6.4.1.). The amount of paint needed to cover the outside of each box is the surface area, a square measure of the total area of all the sides. The amount of space inside the crate is the volume, a cubic measure.

This wooden crate is in the shape of a rectangular solid. (Figure 6.4.1)

Each crate is in the shape of a rectangular solid. Its dimensions are the length, width, and height. The rectangular solid shown in (Figure 6.4.1) has length **4** units, width **2** units, and height **3** units. Can you tell how many cubic units there are altogether? Let's look layer by layer.

Breaking a rectangular solid into layers makes it easier to visualize the number of cubic units it contains. This **4** by **2** by **3** rectangular solid has **24** cubic units.

Figure 6.4.1

Altogether there are **24** cubic units. Notice that **24** is the *length*  $\times$  *width*  $\times$  *height*.

$$\text{Volume} = L \times W \times H$$

$$24 = 4 \times 2 \times 3$$

The volume,  $V$ , of any rectangular solid is the product of the length, width, and height.

$$V = LWH$$

We could also write the formula for volume of a rectangular solid in terms of the area of the base. The area of the base,  $B$ , is equal to *length*  $\times$  *width*.

$$B = LW$$

We can substitute  $B$  for  $LW$  in the volume formula to get another form of the volume formula.

$$V = L \times W \times H$$

$$V = (L \times W) \times H$$

$$V = Bh$$

We now have another version of the volume formula for rectangular solids. Let's see how this works with the  $4 \times 2 \times 3$  rectangular solid we started with. See Figure 6.4.2.

Figure 6.4.2

To find the *surface area* of a rectangular solid, think about finding the area of each of its faces. How many faces does the rectangular solid above have? You can see three of them.

---

$$A_{front} = LW \quad A_{side} = LW \quad A_{top} = LW$$

$$A_{front} = 4 \times 3 \quad A_{side} = 2 \times 3 \quad A_{top} = 4 \times 2$$

$$A_{front} = 12 \quad A_{side} = 6 \quad A_{top} = 8$$

---

Notice for each of the three faces you see, there is an identical opposite face that does not show.

$$S = (\text{front} + \text{back}) + (\text{left side} + \text{right side}) + (\text{top} + \text{bottom})$$

$$S = 2(\text{front}) + 2(\text{left side}) + 2(\text{top})$$

$$S = 2(12) + 2(6) + 2(8)$$

$$S = 24 + 12 + 16$$

$$S = 52 \text{ sq. units}$$

The surface area  $S$  of the rectangular solid shown in Figure 6.4.2 is 52 square units.

In general, to find the surface area of a rectangular solid, remember that each face is a rectangle, so its area is the product of its length and its width (see Figure 6.4.3). Find the area of each face that you see and then multiply each area by two to account for the face on the opposite side.

$$S = 2LH + 2LW + 2WH$$

For each face of the rectangular solid facing you, there is another face on the opposite side. There are 6 faces in all.

Figure 6.4.3

## Volume and Surface Area of a Rectangular Solid

For a rectangular solid with length  $L$ , width  $W$ , and height  $H$ :

Figure 6.4.4

### Example 6.4.1

For a rectangular solid with length **14** cm, height **17** cm, and width **9** cm, find:

- volume
- surface area

#### Solution

*Step 1 is the same for both a. and b., so we will show it just once.*

a. **Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.4.5

**Step 2: Identify what you are looking for.**

The volume of the rectangular solid.

**Step 3: Name. Choose a variable to represent it.**

Let  $V$  = volume.

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$V = LWH$$

$$V = 14 \times 9 \times 17$$

**Step 5: Solve the equation.**

$$V = 2,142$$

**Step 6: Check. Does this answer make sense?**

We leave it to you to check your calculations.

**Step 7: Answer the question.**

The volume is **2,142** cubic centimetres.

---

b. **Step 2: Identify what you are looking for.**

The surface area of the solid

**Step 3: Name. Choose a variable to represent it.**

Let  $S$  = surface area.

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$S = 2LH + 2LW + 2WH$$

$$S = 2(14 \times 17) + 2(14 \times 9) + 2(9 \times 17)$$

**Step 5: Solve the equation.**

$$S = 1,034$$

**Step 6: Check. Does this answer make sense?**

Double-check with a calculator.

**Step 7: Answer the question.**

The surface area is **1,034** square centimetres.

### Try It

4) Find the a. volume and b. surface area of rectangular solid with the: length **8** feet, width **9** feet, and height **11** feet.

**Solution**

a. **792** cu. ft

b. **518** sq. ft

### Try It

5) Find the a. volume and b. surface area of rectangular solid with the: length **15** feet, width **12** feet, and height **8** feet.

**Solution**

a. **1,440** cu. ft

b. **792** sq. ft

### Example 6.4.2

A rectangular crate has a length of **30** inches, width of **25** inches, and height of **20** inches. Find:

- a. volume
- b. surface area

**Solution**

*Step 1 is the same for both a. and b., so we will show it just once.*

a. **Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.4.6

**Step 2: Identify what you are looking for.**

The volume of the crate.

**Step 3: Name. Choose a variable to represent it.**

Let  $V$  = volume.

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$V = LWH$$

$$V = 30 \times 25 \times 20$$

**Step 5: Solve the equation.**

$$V = 15,000$$

**Step 6: Check. Does this answer make sense?**

Double check your math.

**Step 7: Answer the question.**

The volume is **15,000** cubic inches.

b. **Step 2: Identify what you are looking for.**

The surface area of the crate.

**Step 3: Name. Choose a variable to represent it.**

Let  $S$  = surface area.

**Step 4: Translate.**

Write the appropriate formula for the situation and substitute in the given information.

$$S = 2LH + 2LW + 2WH$$

$$S = 2(30 \times 20) + 2(30 \times 25) + 2(25 \times 20)$$

**Step 5: Solve the equation.**

$$S = 3,700$$

**Step 6: Check. Does this answer make sense?**

Check it yourself!

**Step 7: Answer the question.**

The surface area is **3,700** square inches.

## Try It

6) A rectangular box has length **9** feet, width **4** feet, and height **6** feet. Find its a. volume and b. surface area.

**Solution**

a. **216** cu. ft

b. **228** sq. ft

## Try It

7) A rectangular suitcase has length **22** inches, width **14** inches, and height **9** inches. Find its a. volume and b. surface area.

### Solution

a. **2,772** cu. in.

b. **1,264** sq. in.

## Volume and Surface Area of a Cube

A **cube** is a rectangular solid whose length, width, and height are equal. See Volume and Surface Area of a Cube, below. Substituting,  $s$  for the length, width and height into the formulas for volume and surface area of a rectangular solid, we get:

$$V = LWH$$

$$S = 2LH + 2LW + 2WH$$

$$V = sss$$

$$S = 2ss + 2ss + 2ss$$

$$V = s^3$$

$$S = 2s^2 + 2s^2 + 2s^2$$

$$S = 6s^2$$

So for a cube, the formulas for volume and surface area are  $V = s^3$  and  $S = 6s^2$ .

## Volume and Surface Area of a Cube

For any cube with sides of length  $s$ ,

Figure 6.4.7

### Example 6.4.3

A cube is **2.5** inches on each side. Find:

- volume
- surface area

#### Solution

*Step 1 is the same for both a. and b., so we will show it just once.*

a. **Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.4.8

**Step 2: Identify what you are looking for.**

The volume of the cube.

**Step 3: Name. Choose a variable to represent it.**

Let  $V$  = volume.

**Step 4: Translate.**

Write the appropriate formula for the situation.

$$V = s^3$$

**Step 5: Solve. Substitute and Solve.**

$$V = (2.5)^3$$

$$V = 15.625$$

**Step 6: Check — Check your work.**

**Step 7: Answer the question.**

The volume is **15.625** cubic inches.

---

b. **Step 2: Identify what you are looking for.**

The surface area of the cube.

**Step 3: Name. Choose a variable to represent it.**

Let  $S$  = surface area.

**Step 4: Translate.**

Write the appropriate formula for the situation.

$$S = 6s^2$$

**Step 5: Solve and substitute into the equation.**

$$S = 6 \times (2.5)^2$$

$$S = 37.5$$

**Step 6: Check. Does this answer make sense?**

Check is left to you.

**Step 7: Answer the question.**

The surface area is **37.5** square inches.

## Try It

8) For a cube with side **4.5** meters, find:

- a. volume
- b. surface area of the cube

### Solution

- a. **91.125** cu. m
- b. **121.5** sq. m

## Try It

9) For a cube with side **7.3** yards, find:

- a. volume
- b. surface area of the cube

### Solution

- a. **389.017** cu. yd.
- b. **319.74** sq. yd.

### Example 6.4.4

A notepad cube measures 2 inches on each side. Find:

- volume
- surface area

#### Solution

a. **Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.4.9

**Step 2: Identify what you are looking for.**

The volume of the cube.

**Step 3: Name. Choose a variable to represent it.**

Let  $V$  = volume.

**Step 4: Translate.**

Write the appropriate formula for the situation.

$$V = s^3$$

**Step 5: Solve. Substitute and Solve.**

$$V = 2^3$$

$$V = 8$$

**Step 6: Check**

Check that you did the calculations correctly.

**Step 7: Answer the question.**

The volume is 8 cubic inches.

---

b. **Step 2: Identify what you are looking for.**

The surface area of the cube

**Step 3: Name. Choose a variable to represent it.**

Let  $S$  = surface area.

**Step 4: Translate.**

Write the appropriate formula for the situation.

$$S = 6s^2$$

**Step 5: Solve and substitute into the equation.**

$$S = 6 \times (2)^2$$

$$S = 24$$

**Step 6: Check. Does this answer make sense?**

Check is left to you.

**Step 7: Answer the question.**

The surface area is **24** square inches.

## Try It

10) A packing box is a cube measuring **4** feet on each side. Find:

- a. volume
- b. surface area.

### Solution

- a. **64** cu. ft
- b. **96** sq. ft

## Try It

11) A wall is made up of cube-shaped bricks. Each cube is **16** inches on each side. Find the a. volume and b. surface area of each cube.

### Solution

a. **4,096** cu. in.

b. **1536** sq. in.

## Find the Volume and Surface Area of Spheres

A sphere is the shape of a basketball, like a three-dimensional circle. Just like a circle, the size of a sphere is determined by its radius, which is the distance from the centre of the sphere to any point on its surface. The formulas for the volume and surface area of a sphere are given below.

Showing where these formulas come from, like we did for a rectangular solid, is beyond the scope of this course. We will approximate  $\pi$  with **3.14**.

## Volume and Surface Area of a Sphere

For a sphere with radius  $r$ :

Figure 6.4.10

### Example 6.4.5

A sphere has a radius **6** inches. Find:

- a. volume
- b. surface area

#### Solution

*Step 1 is the same for both a. and b., so we will show it just once.*

a. **Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.4.11

**Step 2: Identify what you are looking for.**

The volume of the sphere.

**Step 3: Name. Choose a variable to represent it.**

Let  $V$  = volume.

**Step 4: Translate.**

Write the appropriate formula for the situation.

$$V = \frac{4}{3}\pi r^3$$

**Step 5: Solve. Substitute and Solve.**

$$\begin{aligned} V &\approx \frac{4}{3}(3.14)6^3 \\ V &\approx 904.32 \end{aligned}$$

**Step 6: Check. Double-check your math on a calculator.**

**Step 7: Answer the question.**

The volume is **904.32** cubic inches.

---

b. **Step 2: Identify what you are looking for.**

The surface area of the sphere.

**Step 3: Name. Choose a variable to represent it.**

Let  $S$  = surface area.

**Step 4: Translate.**

Write the appropriate formula for the situation.

$$S = 4\pi r^2$$

**Step 5: Solve and substitute into the equation.**

$$S \approx 4(3.14)6^2$$

$$S \approx 452.16$$

**Step 6: Check math on a calculator.****Step 7: Answer the question.**

The surface area is **452.16** square inches.

## Try It

12) Find the a. volume and b. surface area of a sphere with radius **3** centimetres.

**Solution**

a. **113.04** cu. cm

b. **113.04** sq. cm

## Try It

13) Find the a. volume and b. surface area of each sphere with a radius of **1** foot.

### Solution

- a. **4.19** cu. ft
- b. **12.56** sq. ft

## Example 6.4.6

A globe of Earth is in the shape of a sphere with radius **14** centimetres. Find its a. volume and b. surface area. Round the answer to the nearest hundredth.

### Solution

a. **Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.4.12

**Step 2: Identify what you are looking for.**

The volume of the sphere.

**Step 3: Name. Choose a variable to represent it.**

Let  $V$  = volume.

**Step 4: Translate.**

Write the appropriate formula for the situation.

$$V = \frac{4}{3}\pi r^3$$

**Step 5: Solve. Substitute and Solve.**

$$V \approx \frac{4}{3}(3.14)14^3$$

$$V \approx 11,488.21$$

**Step 6: Check. Double-check your math on a calculator.**

**Step 7: Answer the question.**

The volume is **11,488.21** cubic inches.

---

b. **Step 2: Identify what you are looking for.**

The surface area of the sphere.

**Step 3: Name. Choose a variable to represent it.**

Let  $S$  = surface area.

**Step 4: Translate.**

Write the appropriate formula for the situation.

$$S = 4\pi r^2$$

**Step 5: Solve and substitute into the equation.**

$$S \approx 4(3.14)14^2$$

$$S \approx 2461.76$$

**Step 6: Check math on a calculator.**

**Step 7: Answer the question.**

The surface area is **2461.76** square inches.

## Try It

- 14) A beach ball is in the shape of a sphere with radius of **9** inches. Find:
- a. volume
  - b. surface area

### Solution

- a. **3052.08** cu. in.
- b. **1017.36** sq. in.

## Try It

- 15) A Roman statue depicts Atlas holding a globe with radius of **1.5** feet. Find:
- a. volume
  - b. surface area of the globe

### Solution

- a. **14.13** cu. ft
- b. **28.26** sq. ft

## Find the Volume and Surface Area of a Cylinder

If you have ever seen a can of soda, you know what a **cylinder** looks like. A cylinder is a solid figure with two parallel circles of the same size at the top and bottom. The top and bottom of a cylinder are called the bases. The height  $h$  of a cylinder is the distance between the two bases. For all the cylinders we will work with here, the sides and the height,  $h$ , will be perpendicular to the bases.

A cylinder has two circular bases of equal size. The height is the distance between the bases.

Figure 6.4.13

Rectangular solids and cylinders are somewhat similar because they both have two bases and a height. The formula for the volume of a rectangular solid,  $V = Bh$ , can also be used to find the volume of a cylinder.

For the rectangular solid, the area of the base,  $B$ , is the area of the rectangular base,  $length \times width$ . For a cylinder, the area of the base,  $B$ , is the area of its circular base,  $\pi r^2$ . Figure 6.4.14 compares how the formula  $V = Bh$  is used for rectangular solids and cylinders.

Seeing how a cylinder is similar to a rectangular solid may make it easier to understand the formula for the volume of a cylinder.

Figure 6.4.14

To understand the formula for the surface area of a cylinder, think of a can of vegetables. It has three surfaces: the top, the bottom, and the piece that forms the sides of the can. If you carefully cut the label off the side of the can and unroll it, you will see that it is a rectangle. See Figure 6.4.15.

By cutting and unrolling the label of a can of vegetables, we can see that the surface of a cylinder is a rectangle. The length of the rectangle is the circumference of the cylinder's base, and the width is the height of the cylinder.

Figure 6.4.15

The distance around the edge of the can is the circumference of the cylinder's base it is also the length  $L$  of the rectangular label. The height of the cylinder is the width  $W$  of the rectangular label. So the area of the label can be represented as:

$$A = L \times W$$

$$A = (2\pi r) \times (h)$$

To find the total surface area of the cylinder, we add the areas of the two circles to the area of the rectangle.

$$S = A_{\text{top circle}} + A_{\text{bottom circle}} + A_{\text{rectangle}}$$

$$S = \pi r^2 + \pi r^2 + 2\pi r \cdot h$$

$$S = 2 \cdot \pi r^2 + 2\pi r h$$

$$S = 2\pi r^2 + 2\pi r h$$

Figure 6.4.16

The surface area of a cylinder with radius  $r$  and height  $h$ , is:

$$S = 2\pi r^2 + 2\pi r h$$

## Volume and Surface Area of a Cylinder

For a cylinder with radius  $r$  and height  $h$ :

Figure 6.4.17

### Example 6.4.7

A cylinder has height **5** centimetres and radius **3** centimetres. Find the a. volume and b. surface area.

#### Solution

a. **Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.4.18

**Step 2: Identify what you are looking for.**

The volume of the cylinder.

**Step 3: Name. Choose a variable to represent it.**

Let  $V$  = volume.

**Step 4: Translate.**

Write the appropriate formula for the situation.

Use 3.14 for  $\pi$ .

$$V = \pi r^2 h$$

**Step 5: Solve. Substitute and Solve.**

$$V \approx (3.14)3^2 \times 5$$

$$V \approx 141.3$$

**Step 6: Check. Double-check your math on a calculator.**

**Step 7: Answer the question.**

The volume is **141.3** cubic inches.

---

b. **Step 2: Identify what you are looking for.**

The surface area of the cylinder.

**Step 3: Name. Choose a variable to represent it.**

Let  $S$  = surface area.

**Step 4: Translate.**

Write the appropriate formula for the situation.

Use 3.14 for  $\pi$ .

$$S = 2\pi r^2 + 2\pi rh$$

**Step 5: Solve and substitute into the equation.**

$$S \approx 2(3.14)3^2 + 2(3.14)(3)5$$

$$S \approx 150.72$$

**Step 6: Check math on a calculator.**

**Step 7: Answer the question.**

The surface area is approximately **150.72** square inches.

### Try It

16) Find the a. volume and b. surface area of the cylinder with radius **4** cm and height **7** cm.

**Solution**

a. **351.68** cu. cm

b. **276.32** sq. cm

### Try It

17) Find the a. volume and b. surface area of the cylinder with given radius **2** ft and height **8** ft.

**Solution**

a. **100.48** cu. ft

b. **125.6** sq. ft

### Example 6.4.8

Find the a. volume and b. surface area of a can of soda. The radius of the base is **4** centimetres and the height is **13** centimetres. Assume the can is shaped exactly like a cylinder.

**Solution**

a. **Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.4.19

**Step 2: Identify what you are looking for.**

The volume of the cylinder.

**Step 3: Name. Choose a variable to represent it.**

Let  $V$  = volume.

**Step 4: Translate.**

Write the appropriate formula for the situation.

Use 3.14 for  $\pi$ .

$$V = \pi r^2 h$$

**Step 5: Solve. Substitute and Solve.**

$$V \approx (3.14)4^2 \times 13$$

$$V \approx 653.12$$

**Step 6: Check. Double-check your math on a calculator.**

**Step 7: Answer the question.**

The volume is approximately **653.12** cubic inches.

b. **Step 2: Identify what you are looking for.**

The surface area of the cylinder.

**Step 3: Name. Choose a variable to represent it.**

Let  $S$  = surface area.

**Step 4: Translate.**

Write the appropriate formula for the situation.

Use 3.14 for  $\pi$ .

$$S = 2\pi r^2 + 2\pi rh$$

**Step 5: Solve and substitute into the equation.**

$$S \approx 2(3.14)4^2 + 2(3.14)(4)13$$

$$S \approx 427.04$$

**Step 6: Check math on a calculator.****Step 7: Answer the question.**

The surface area is approximately **427.04** square inches.

**Try It**

18) Find the a. volume and b. surface area of a can of paint with radius 8 centimetres and height 19 centimetres. Assume the can is shaped exactly like a cylinder.

**Solution**

a. **3,818.24** cu. cm

b. **1,356.48** sq. cm

## Try It

19) Find the a. volume and b. surface area of a cylindrical drum with radius **2.7** feet and height **4** feet. Assume the drum is shaped exactly like a cylinder.

### Solution

a. **91.5624** cu. ft

b. **113.6052** sq. ft

## Find the Volume of Cones

The first image that many of us have when we hear the word ‘**cone**’ is an ice cream cone. There are many other applications of cones (but most are not as tasty as ice cream cones). In this section, we will see how to find the volume of a cone.

In geometry, a cone is a solid figure with one circular base and a vertex. The height of a cone is the distance between its base and the vertex. The cones that we will look at in this section will always have the height perpendicular to the base. See Figure 6.4.20. The height of a cone is the distance between its base and the vertex.

Figure 6.4.20

Earlier in this section, we saw that the volume of a cylinder is  $V = \pi r^2 h$ . We can think of a cone as part of a cylinder. Figure 6.4.21 shows a cone placed inside a cylinder with the same height and same base. If we compare the volume of the cone and the cylinder, we can see that the volume of the cone is less than that of the cylinder.

The volume of a cone is less than the volume of a cylinder with the same base and height.

Figure 6.4.21

In fact, the volume of a cone is exactly one-third of the volume of a cylinder with the same base and height. The volume of a cone is:

$$V = \frac{1}{3}Bh$$

Since the base of a cone is a circle, we can substitute the formula of area of a circle,  $\pi r^2$ , for  $B$  to get the formula for volume of a cone.

$$V = \frac{1}{3}\pi r^2 h$$

In this book, we will only find the volume of a cone, and not its surface area.

## Volume of a Cone

For a cone with radius  $r$  and height  $h$ .

Figure 6.4.22

### Example 6.4.9

Find the volume of a cone with height **6** inches and radius of its base **2** inches.

#### Solution

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.4.23

**Step 2: Identify what you are looking for.**

The volume of the cone.

**Step 3: Name. Choose a variable to represent it.**

Let  $V$  = volume.

**Step 4: Translate.**

Write the appropriate formula for the situation.

Use **3.14** for  $\pi$ .

$$V = \frac{1}{3}\pi r^2 h$$

**Step 5: Solve. Substitute and Solve.**

$$V \approx \frac{1}{3} \times 3.14 \times (2)^2 \times (6)$$

$$V \approx 25.12$$

**Step 6: Check. Double-check your math on a calculator.**

**Step 7: Answer the question.**

The volume is approximately **25.12** cubic inches.

**Try It**

20) Find the volume of a cone with height **7** inches and radius **3** inches

**Solution**

**65.94** cu. in.

**Try It**

21) Find the volume of a cone with height **9** centimetres and radius **5** centimetres

**Solution**

**235.5** cu. cm

**Example 6.4.10**

Marty's favourite gastro pub serves french fries in a paper wrap shaped like a cone. What is the volume of a conic wrap that is 8 inches tall and 5 inches in diameter? Round the answer to the nearest hundredth.

**Solution**

**Step 1: Read the problem. Draw the figure and label it with the given information.**

Figure 6.4.24

**Step 2: Identify what you are looking for.**

The volume of the cone.

**Step 3: Name. Choose a variable to represent it.**

Let  $V$  = volume.

**Step 4: Translate.**

Write the appropriate formula for the situation.

Use 3.14 for  $\pi$ .

$$V = \frac{1}{3}\pi r^2 h$$

**Step 5: Solve. Substitute and Solve.**

$$\begin{aligned} V &\approx \frac{1}{3} \times 3.14 \times (2.5)^2 \times (8) \\ V &\approx 52.33 \end{aligned}$$

**Step 6: Check. Double-check your math on a calculator.**

**Step 7: Answer the question.**

The volume of the wrap is approximately **52.33** cubic inches.

**Try It**

22) How many cubic inches of candy will fit in a cone-shaped piñata that is **18** inches long and **12** inches across its base? Round the answer to the nearest hundredth.

**Solution**

**678.24** cu. in.

**Try It**

23) What is the volume of a cone-shaped party hat that is **10** inches tall and **7** inches across at the base? Round the answer to the nearest hundredth.

**Solution**

**128.2** cu. in.

## Summary of Geometry Formulas

The following charts summarize all of the formulas covered in this chapter.

<p><b>Supplementary and Complementary Angles</b></p> <p><math>m\angle A + m\angle B = 180^\circ</math> for supplementary angles A and B  <math>m\angle C + m\angle D = 90^\circ</math> for complementary angles C and D</p> 	<p><b>Triangle</b></p> <p>For <math>\triangle ABC</math>, angle measures.  <math>m\angle A + m\angle B + m\angle C = 180^\circ</math>          Perimeter. <math>P = a + b + c</math>  <math>A = \frac{1}{2}bh</math></p>

## Key Concepts

- **Volume and Surface Area of a Rectangular Solid**
  - $V = LWH$
  - $S = 2LH + 2LW + 2WH$
- **Volume and Surface Area of a Cube**
  - $V = s^3$
  - $S = 6s^2$
- **Volume and Surface Area of a Sphere**

- $V = \frac{4}{3}\pi r^3$

- $S = 4\pi r^2$

- **Volume and Surface Area of a Cylinder**

- $V = \pi r^2 h$

- $S = 2\pi r^2 + 2\pi r h$

- **Volume of a Cone**

- For a cone with radius  $r$  and height  $h$ :

Volume:  $V = \frac{1}{3}\pi r^2 h$

## Self Check

After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=6714#h5p-41>

After reviewing this checklist, what will you do to become confident for all objectives?

## Glossary

**cone**

A cone is a solid figure with one circular base and a vertex.

**cube**

A cube is a rectangular solid whose length, width, and height are equal.

**cylinder**

A cylinder is a solid figure with two parallel circles of the same size at the top and bottom.

## 6.5 SINE, COSINE AND TANGENT RATIOS AND APPLICATIONS OF TRIGONOMETRY

---

### Learning Objectives

By the end of this section it is expected that you will be able to

- Find missing side of a right triangle using sine, cosine, or tangent ratios
- Find missing angle of a right triangle using sine, cosine, or tangent ratios
- Solve applications using right angle trigonometry

Now, that we know the fundamentals of algebra and geometry associated with a right triangle, we can start exploring trigonometry. Many real life problems can be represented and solved using right angle trigonometry.

### Sine, Cosine, and Tangent Ratios

We know that any right triangle has three sides and a right angle. The side opposite to the right angle is called the hypotenuse. The other two angles in a right triangle are acute angles (with a measure less than 90 degrees). One of those angles we call reference angle and we use  $\theta$  (theta) to represent it.

The hypotenuse is always the longest side of a right triangle. The other two sides are called opposite side and adjacent side. The names of those sides depends on which of the two acute angles is being used as a reference angle.

Figure 6.5.1

In the right triangle each side is labelled with a lowercase letter to match the uppercase letter of the opposite vertex.

### Example 6.5.1

Label the sides of the triangle and find the hypotenuse, opposite, and adjacent.

Figure 6.5.2

**Solution**

We labelled the sides with a lowercase letter to match the uppercase letter of the opposite vertex.

$c$  is hypotenuse

$a$  is opposite

$b$  is adjacent

Figure 6.5.3

## Try It

1) Label the sides of the triangle and find the hypotenuse, opposite and adjacent.

Figure 6.5.4

## Solution

$y$  is hypotenuse

$z$  is opposite

$x$  is adjacent

## Trigonometric Ratios

Trigonometric ratios are the ratios of the sides in the right triangle. For any right triangle we can define three basic trigonometric ratios: sine, cosine, and tangent.

Let us refer to Figure 6.5.1 and define the three basic trigonometric ratios as:

### Three Basic Trigonometric Ratios

- $\text{sine}(\theta) = \frac{\text{the length of the opposite side}}{\text{the length of the hypotenuse side}}$
- $\text{cosine}(\theta) = \frac{\text{the length of the adjacent side}}{\text{the length of the hypotenuse side}}$
- $\text{tangent}(\theta) = \frac{\text{the length of the opposite side}}{\text{the length of the adjacent side}}$

Where  $\theta$  is the measure of a reference angle measured in degrees.

Very often we use the abbreviations for sine, cosine, and tangent ratios.

- $\sin(\theta) = \frac{\text{opp}}{\text{hyp}}$
- $\cos(\theta) = \frac{\text{adj}}{\text{hyp}}$
- $\tan(\theta) = \frac{\text{opp}}{\text{adj}}$

Some people remember the definition of the trigonometric ratios as SOH CAH TOA.

Let's use the  $\triangle DEF$  from Example 6.5.2 to find the three ratios.

### Example 6.5.2

For the given triangle find the sine, cosine and tangent ratio.

Figure 6.5.5

#### Solution

$$\sin(\theta) = \frac{f}{d}$$

$$\cos(\theta) = \frac{e}{d}$$

$$\tan(\theta) = \frac{f}{e}$$

## Try It

2) For the given triangle find the sine cosine and tangent ratio.

Figure 6.5.6

### Solution

$$\sin(\theta) = \frac{z}{y}$$

$$\cos(\theta) = \frac{x}{y}$$

$$\tan(\theta) = \frac{z}{x}$$

In Example 6.5.2, our reference angles can be angle  $E$  or angle  $F$ . Using the definition of trigonometric ratios, we can write  $\sin(E) = \frac{e}{d}$ ,  $\cos(E) = \frac{f}{d}$ , and  $\tan(E) = \frac{e}{f}$ .

When calculating we will usually round the ratios to four decimal places and at the end our final answer to one decimal place unless stated otherwise.

### Example 6.5.3

For the given triangle find the sine, cosine and tangent ratios. If necessary round to four decimal places.

Figure 6.5.7

#### Solution

We have two possible reference angles:  $R$  and  $S$ .

Using the definitions, the trigonometric ratios for angle  $R$  are:

- $\sin(R) = \frac{4}{5} = 0.8$
- $\cos(R) = \frac{3}{5} = 0.6$
- $\tan(R) = \frac{4}{3} = 1.3333\dots$

Using the definitions, the trigonometric ratios for angle  $S$ :

- $\sin(S) = \frac{3}{5} = 0.6$
- $\cos(S) = \frac{4}{5} = 0.8$
- $\tan(S) = \frac{3}{4} = 0.75$

## Try It

3) For the given triangle find the sine, cosine, and tangent ratios. If necessary round to four decimal places.

Figure 6.5.8

### Solution

- $\sin(F) = \frac{8}{10} = 0.8$
- $\cos(F) = \frac{6}{10} = 0.6$
- $\tan(F) = \frac{8}{6} = 1.3333\dots$
- $\sin(D) = \frac{6}{10} = 0.6$
- $\cos(D) = \frac{8}{10} = 0.8$
- $\tan(D) = \frac{6}{8} = 0.75$

Now, let us use a scientific calculator to find the trigonometric ratios. Can you find the sin, cos, and tan buttons on your calculator? To find the trigonometric ratios make sure your calculator is in Degree Mode.

### Example 6.5.4

Using a calculator find the trigonometric ratios. If necessary, round to 4 decimal places.

a)  $\sin(30^\circ)$

b)  $\cos(45^\circ)$

c)  $\tan(60^\circ)$

#### Solution

Make sure your calculator is in Degree Mode.

a. Using a calculator find that  $\sin(30^\circ) = 0.5$

b. Using a calculator find that  $\cos(45^\circ) = 0.7071$  Rounded to 4 decimal places.

c. Using a calculator find that  $\tan(60^\circ) = 1.7321$  Rounded to 4 decimal places.

### Try It

4) Find the trigonometric ratios. If necessary, round to 4 decimal places.

a.  $\sin(60^\circ)$

b.  $\cos(30^\circ)$

c.  $\tan(45^\circ)$

#### Solution:

a.  $\sin(60^\circ) = 0.8660$

b.  $\cos(30^\circ) = 0.8660$

c.  $\tan(45^\circ) = 1$

## Finding Missing Sides of a Right Triangle

In this section you will be using trigonometric ratios to solve right triangle problems. We will adapt our problem solving strategy for trigonometry applications. In addition, since those problems will involve the right triangle, it is helpful to draw it (if the drawing is not given) and label it with the given information. We will include this in the first step of the problem solving strategy for trigonometry applications.

### HOW TO:

#### Solve Trigonometry Applications

1. Read the problem and make sure all the words and ideas are understood. Draw the right triangle and label the given parts.
2. Identify what we are looking for.
3. Label what we are looking for by choosing a variable to represent it.
4. Find the required trigonometric ratio.
5. Solve the ratio using good algebra techniques.
6. Check the answer by substituting it back into the ratio in step 4 and by making sure it makes sense in the context of the problem.
7. Answer the question with a complete sentence

In the next few examples, having given the measure of one acute angle and the length of one side of the right triangle, we will solve the right triangle for the missing sides.

### Example 6.5.5

Find the missing sides. Round your final answer to two decimal places

Figure 6.5.9

**Solution**

**Step 1: Read problem and make sure all the words and ideas are understood. Draw the right triangle and label the given parts.**

A drawing is given. Angle  $Y$  is our reference angle,  $y$  is opposite side,  $z$  is adjacent side, and  $x = 14$  is the hypotenuse.

**Step 2: Identify what you are looking for.**

- a. The opposite side.
- b. Adjacent side.

**Step 3: Label what we are looking for by choosing a variable to represent it.**

$$y = ?$$

$$z = ?$$

**Step 4: Find the required trigonometric ratio.**

$$\text{a. } \sin(35^\circ) = \frac{y}{14}$$

$$\text{b. } \cos(35^\circ) = \frac{z}{14}$$

**Step 5: Solve the ratio using good algebra techniques.**

$$\begin{aligned}\text{a. } 14 \sin(35^\circ) &= y \\ 8.03 &= y\end{aligned}$$

$$\begin{aligned}\text{b. } 14 \sin(35^\circ) &= z \\ 11.47 &= z\end{aligned}$$

**Step 6: Check the answer in the problem and by making sure it makes sense.**

$$\begin{aligned}\text{a. } 0.57 &\stackrel{?}{=} 8.03 \div 14 \\ 0.57 &= 0.57\checkmark\end{aligned}$$

$$\begin{aligned}\text{b. } 0.82 &\stackrel{?}{=} 11.47 \div 14 \\ 0.82 &= 0.82\checkmark\end{aligned}$$

**Step 7: Answer the question with a complete sentence.**

- a. The opposite side is **8.03**.
- b. The adjacent side is **11.47**.

## Try It

5) Find the missing sides. Round your final answer to one decimal place.

Figure 6.5.10

**Solution**

$$a = 20.2$$

$$b = 16.4$$

**Example 6.5.6**

Find the hypotenuse. Round your final answer to one decimal place.

Figure 6.5.11

**Solution**

**Step 1: Read problem and make sure all the words and ideas are understood. Draw the right triangle and label the given parts.**

A drawing is given. Angle  $S$  is our reference angle,  $R$  is opposite side,  $r = 4$  is the adjacent side, and  $P$  is the hypotenuse.

**Step 2: Identify what you are looking for.**

The hypotenuse.

**Step 3: Label what we are looking for by choosing a variable to represent it.**

$$p = ?$$

**Step 4: Find the required trigonometric ratio.**

$$\cos(32^\circ) = \frac{4}{p}$$

**Step 5: Solve the ratio using good algebra techniques.**

$$0.8480 = \frac{4}{p}$$

$$p = 4.7170 \quad \text{Rounding the ratios to 4 decimal places}$$

**Step 6: Check the answer in the problem and by making sure it makes sense.**

$$0.8480 \stackrel{?}{=} \frac{4}{4.7170}$$

$$0.8480 = 0.8480 \checkmark$$

**Step 7: Answer the question with a complete sentence.**

The hypotenuse is **4.7**. Round final answer to one decimal place.

## Try It

6) Find the hypotenuse. Round your final answer to one decimal place.

Figure 6.5.12

**Solution**

$$p = 22.7$$

## Finding Missing Angles of a Right Triangle

Sometimes we have a right triangle with only the sides given. How can we find the missing angles? To find the missing angles, we use the inverse of the trigonometric ratios. The inverse buttons  $\sin^{-1}$ ,  $\cos^{-1}$ , and  $\tan^{-1}$  are on your scientific calculator.

### Example 6.5.7

Find the angles. Round your final answer to one decimal place.

- $\sin(A) = 0.5$
- $\cos(B) = 0.9735$
- $\tan(C) = 2.89358$

**Solution**

Use your calculator and press the 2nd FUNCTION key and then press the SIN, COS, or TAN key

- a.  $A = \sin^{-1}(0.5)$   
 $\angle A = 30^\circ$
- b.  $B = \cos^{-1}(0.9735)$  *Rounded to one decimal place*  
 $\angle B = 13.2^\circ$
- c.  $C = \tan^{-1}(2.89358)$  *Rounded to one decimal place*  
 $\angle C = 70.9^\circ$

## Try It

7) Find the angles. Round your final answer to one decimal place.

- a.  $\sin(X) = 1$   
 b.  $\cos(Y) = 0.375$   
 c.  $\tan(Z) = 1.676767$

### Solution

- a.  $\angle X = 90^\circ$   
 b.  $\angle Y = 68^\circ$   
 c.  $\angle Z = 59.2^\circ$

In the example below we have a right triangle with two sides given. Our acute angles are missing. Let us see what the steps are to find the missing angles.

### Example 6.5.8

Find the missing  $\angle T$ . Round your final answer to one decimal place.

Figure 6.5.13

#### Solution

**Step 1: Read problem and make sure all the words and ideas are understood. Draw the right triangle and label the given parts.**

A drawing is given. Angle  $T$  is our reference angle,  $t = 7$  is the opposite side,  $s$  is adjacent side, and  $r = 11$  is the hypotenuse.

**Step 2: Identify what you are looking for.**

Angle  $T$ .

**Step 3: Label what we are looking for by choosing a variable to represent it.**

$$\angle T = ?$$

**Step 4: Find the required trigonometric ratio.**

$$\sin(T) = \frac{7}{11}$$

**Step 5: Solve the ratio using good algebra techniques.**

$$\sin(T) = 0.6364$$

$$T = \sin^{-1}(0.6364)$$

$$\angle T = 39.5239^\circ$$

**Step 6: Check the answer in the problem and by making sure it makes sense.**

$$\sin(39.523^\circ) \stackrel{?}{=} 0.6364$$

$$0.6364 = 0.6364 \checkmark$$

**Step 7: Answer the question with a complete sentence.**

The missing angle  $T$  is  $39.5^\circ$ .

## Try It

8) Find the missing angle  $X$ . Round your final answer to one decimal place.

Figure 6.5.14

**Solution**

$20.1^\circ$

**Example 6.5.9**

Find the missing angle  $A$ . Round your final answer to one decimal place.

Figure 6.5.15

**Solution**

**Step 1:** Read problem and make sure all the words and ideas are understood. Draw the right triangle and label the given parts.

A drawing is given. Angle  $A$  is our reference angle,  $a = 9$  is the opposite side,  $c = 5$  is the adjacent side, and  $b$  is the hypotenuse.

**Step 2:** Identify what you are looking for.

Angle  $A$ .

**Step 3:** Label what we are looking for by choosing a variable to represent it.

$$\angle A = ?$$

**Step 4:** Find the required trigonometric ratio.

$$\tan A = \frac{9}{5}$$

**Step 5:** Solve the ratio using good algebra techniques.

$$\tan(A) = 1.8$$

$$A = \tan^{-1}(1.8)$$

$$\angle A = 60.9^\circ$$

**Step 6: Check the answer in the problem and by making sure it makes sense.**

$$\tan 60.9^\circ \stackrel{?}{=} 1.8$$

$$1.8 = 1.8 \checkmark$$

**Step 7: Answer the question with a complete sentence.**

The missing angle  $A$  is  $60.9^\circ$ .

## Try It

9) Find the missing angle  $C$ . Round your final answer to one decimal place.

Figure 6.5.16

**Solution**

$29.1^\circ$

## Solving a Right Triangle

From the section before we know that any triangle has three sides and three interior angles. In a right triangle, when all six parts of the triangle are known, we say that the right triangle is solved.

### Example 6.5.10

Solve the right triangle. Round your final answer to one decimal place.

Figure 6.5.17

#### Solution

Since the sum of angles in any triangle is  $180^\circ$ , the measure of angle B can be easily calculated.

$$\angle B = 180^\circ - 90^\circ - 42^\circ$$

$$\angle B = 48^\circ$$

**Step 1: Read problem and make sure all the words and ideas are understood. Draw the right triangle and label the given parts.**

A drawing is given. Angle  $A$  is our reference angle,  $a = 8$  is the opposite side,  $b$  is the adjacent side, and  $c$  is the hypotenuse.

**Step 2: Identify what you are looking for.**

- a. The adjacent side.
- b. The hypotenuse.

**Step 3: Label what we are looking for by choosing a variable to represent it.**

- a.  $b = ?$
- b.  $c = ?$

**Step 4: Find the required trigonometric ratio.**

$$\text{a. } \tan(42^\circ) = \frac{8}{b}$$

$$\text{b. } \sin(42^\circ) = \frac{8}{c}$$

**Step 5: Solve the ratio using good algebra techniques.**

$$\begin{aligned} \text{a. } 0.9004 &= \frac{8}{b} \\ 0.9004b &= 8 \\ b &= 8.8849 \end{aligned}$$

$$\begin{aligned} \text{b. } 0.6691 &= \frac{8}{c} \\ 0.6691c &= 8 \\ c &= 11.9563 \end{aligned}$$

**Step 6: Check the answer in the problem and by making sure it makes sense.**

$$\begin{aligned} \text{a. } \tan(42^\circ) &\stackrel{?}{=} \frac{8}{8.8849} \\ 0.9 &= 0.9 \checkmark \end{aligned}$$

$$\begin{aligned} \text{b. } \sin(42^\circ) &\stackrel{?}{=} \frac{8}{11.9563} \\ 0.6691 &= 0.6691 \checkmark \end{aligned}$$

**Step 7: Answer the question with a complete sentence.**

- a. The adjacent side is **8.9**. *Rounded to one decimal place.*
- b. The hypotenuse is **12**.

We solved the right triangle

$$\angle A = 42^\circ$$

$$\angle B = 48^\circ$$

$$\angle C = 90^\circ$$

$$a = 8$$

$$b = 8.9$$

$$c = 12$$

## Try It

10) Solve the right triangle. Round your final answer to one decimal place.

Figure 6.5.18

$$\angle A = 21^\circ$$

$$\angle B = 69^\circ$$

$$\angle C = 90^\circ$$

**Solution**

$$a = 6$$

$$b = 15.6$$

$$c = 16.7$$

**Example 6.5.11**

Solve the right triangle. Round to two decimal places.

Figure 6.5.19

**Solution**

**Step 1: Read problem and make sure all the words and ideas are understood. Draw the right triangle and label the given parts.**

A drawing is given. Let angle  $D$  be our reference angle,  $d = 4$  is the opposite side,  $f$  is the adjacent side, and  $e = 9$  is the hypotenuse.

**Step 2: Identify what you are looking for.**

- a. Angle  $D$ .
- b. The adjacent.

**Step 3: Label what we are looking for by choosing a variable to represent it.**

$$\text{a. } \angle D = ?$$

$$\text{b. } f = ?$$

**Step 4: Find the required trigonometric ratio.**

$$\text{a. } \sin(D) = \frac{4}{9}$$

$$\text{b. } 4^2 + f^2 = 9^2$$

**Step 5: Solve the ratio using good algebra techniques.**

$$\begin{aligned} \text{a. } \sin(D) &= 0.4444 \\ D &= \sin^{-1} 0.4444 \\ \angle D &= 26.3850^\circ \end{aligned}$$

$$\begin{aligned} \text{b. } 16 + f^2 &= 81 \\ f^2 &= 81 - 16 \\ f^2 &= 65 \\ f &= \sqrt{65} \\ f &= 8.06 \end{aligned}$$

**Step 6: Check the answer in the problem and by making sure it makes sense.**

$$\begin{aligned} \text{a. } \sin(26.3850^\circ) &\stackrel{?}{=} \frac{4}{9} \\ 0.4444 &= 0.4444 \checkmark \end{aligned}$$

$$\begin{aligned} \text{b. } 4^2 + 8.06^2 &\stackrel{?}{=} 9^2 \\ 81 &= 81 \checkmark \end{aligned}$$

**Step 7: Answer the question with a complete sentence.**

- a. The missing angle  $D$  is  $26.39^\circ$ .  
 b. The adjacent side is  $8.06$ . *Rounded to two decimal places.*

The missing angle  $F = 180^\circ - 90^\circ - 26.39^\circ$ .  
 $F = 63.61^\circ$

We solved the right triangle

$$\angle D = 26.39^\circ$$

$$\angle E = 90^\circ$$

$$\angle F = 63.61^\circ$$

$$d = 4$$

$$e = 9$$

$$f = 8.06$$

## Try It

11) Solve the right triangle. Round to one decimal place.

Figure 6.5.20

$$\angle D = 29.3^\circ$$

$$\angle E = 90^\circ$$

$$\angle F = 60.7^\circ$$

### Solution

$$d = 29.4$$

$$e = 18.4$$

$$f = 60.6$$

## Solve Applications Using Trigonometric Ratios

In the previous examples we were able to find missing sides and missing angles of a right triangle. Now, let's use the trigonometric ratios to solve real-life problems.

Many applications of trigonometric ratios involve understanding of an angle of elevation or angle of depression.

The angle of elevation is an angle between the horizontal line (ground) and the observer's line of sight.

Figure 6.5.21

The angle of depression is the angle between horizontal line (that is parallel to the ground) and the observer's line of sight.

Figure 6.5.22

### Example 6.5.12

James is standing **31** metres away from the base of the Harbour Centre in Vancouver. He looks up to the top of the building at a  **$78^\circ$**  angle. How tall is the Harbour Centre?

#### Solution

**Step 1:** Read problem and make sure all the words and ideas are understood. Draw the right triangle and label the given parts.

Figure 6.5.23

Angle  $X$  is our reference angle,  $x$  is opposite side,  $y = 31\text{m}$  is the adjacent side, and  $z$  is the hypotenuse.

**Step 2: Identify what you are looking for.**

The opposite side.

**Step 3: Label what we are looking for by choosing a variable to represent it.**

$$x = ?$$

**Step 4: Find the required trigonometric ratio.**

$$\tan(78^\circ) = \frac{x}{31}$$

**Step 5: Solve the ratio using good algebra techniques.**

$$\begin{aligned} 4.7046 &= \frac{x}{31} \\ x &= 145.8426 \end{aligned}$$

**Step 6: Check the answer in the problem and by making sure it makes sense.**

$$4.7046 \stackrel{?}{=} \frac{145.8426}{31}$$

$$4.7046 = 4.7046 \checkmark$$

**Step 7: Answer the question with a complete sentence.**

The Harbour Centre is **145.8426** metres or rounded to 146 metres.

## Try It

12) Marta is standing **23** metres away from the base of the tallest apartment building in Prince George and looks at the top of the building at a **62°** angle. How tall is the building?

**Solution**

**43.3** metres

## Example 6.5.13

Thomas is standing at the top of the building that is **45** metres high and looks at her friend that is standing on the ground, **22** metres from the base of the building. What is the angle of depression?

**Solution**

**Step 1: Read problem and make sure all the words and ideas are understood. Draw the right triangle and label the given parts.**

Figure 6.5.24

Angle  $Y$  is our reference angle,  $y = 45\text{m}$  is the opposite side,  $z = 22\text{m}$  is the adjacent side, and  $x$  is the hypotenuse.

**Step 2: Identify what you are looking for.**

The angle  $Y$ .

**Step 3: Label what we are looking for by choosing a variable to represent it.**

$$\angle Y = ?$$

**Step 4: Find the required trigonometric ratio.**

$$\tan(Y) = \frac{45}{22}$$

**Step 5: Solve the ratio using good algebra techniques.**

$$\tan(Y) = 2.0455$$

$$Y = \tan^{-1}(2.0455)$$

$$\angle Y = 63.9470^\circ$$

**Step 6: Check the answer in the problem and by making sure it makes sense.**

$$\tan(63.9470^\circ) \stackrel{?}{=} 2.0455$$

$$2.0455 = 2.0455 \checkmark$$

**Step 7: Answer the question with a complete sentence.**

The angle of depression is  $63.9470^\circ$  or  $64.0^\circ$  rounded to one decimal place.

**Try It**

13) Hemanth is standing on the top of a cliff **250** feet above the ground and looks at his friend that is standing on the ground, **40** feet from the base of the cliff. What is the angle of depression?

**Solution**

$80.9^\circ$

**Key Concepts**

- **Three Basic Trigonometric Ratios:** (Where  $\theta$  is the measure of a reference angle measured in degrees).

$$\begin{aligned} \circ \text{ sine } \theta &= \frac{\text{the length of the opposite side}}{\text{the length of the hypotenuse side}} \\ \circ \text{ cosine } \theta &= \frac{\text{the length of the adjacent side}}{\text{the length of the hypotenuse side}} \\ \circ \text{ tangent } \theta &= \frac{\text{the length of the opposite side}}{\text{the length of the adjacent side}} \end{aligned}$$

- **Problem-Solving Strategy for Trigonometry Applications**

1. Read the problem and make sure all the words and ideas are understood. Draw the right triangle and label the given parts.
2. Identify what we are looking for.
3. Label what we are looking for by choosing a variable to represent it.
4. Find the required trigonometric ratio.
5. Solve the ratio using good algebra techniques.
6. Check the answer by substituting it back into the ratio solved in step 5 and by making sure it makes sense in the context of the problem.
7. Answer the question with a complete sentence.

## Self Check

a. After completing the exercises, use this checklist to evaluate your mastery of the objectives of this section.

*An interactive H5P element has been excluded from this version of the text. You can view it online here:*

<https://ecampusontario.pressbooks.pub/prehealthsciencesmath1/?p=6064#h5p-46>

b. Overall, after looking at the checklist, do you think you are well-prepared for the next section? Why or why not?

---

### Exercises: Find Least Common Multiples Using Multiples Method

Instructions: For questions 60-65, find the least common multiple of the each pair of numbers using the multiples method.

**60.** 8, 12

**Solution**

24

---

**61.** 4, 3

---

**62.** 12, 16

**Solution**

48

---

**63.** 30, 40

---

**64.** 20, 30

**Solution**

60

---

**65.** 44, 55

---

### Exercises: Find Least Common Multiples using Prime Factors Method

Instructions: For questions 66-71, find the least common multiple of each pair of numbers using the prime factors method.

**66.** 8, 12

**Solution**

24

---

**67.** 12, 16

---

**68.** 28, 40

**Solution**

420

---

69. 84, 90

---

70. 55, 88

**Solution**

440

---

71. 60, 72

---

## Exercises: Everyday Math

Instructions: For questions 72-79, answer the everyday math word problems.

**72. Writing a Check.** Jorge bought a car for \$24,493. He paid for the car with a check. Write the purchase price in words.

**Solution**

twenty-four thousand, four hundred ninety-three dollars

---

**73. Writing a Check.** Marissa's kitchen remodeling cost \$18,549. She wrote a check to the contractor. Write the amount paid in words.

---

**74. Buying a Car:** Jorge bought a car for \$24,493. Round the price to the nearest

- a. ten**
- b. hundred**
- c. thousand**
- d. ten-thousand**

**Solution**

- a. \$24,490
  - b. \$24,500
  - c. \$24,000
  - d. \$20,000
- 

**75. Remodeling a Kitchen.** Marissa's kitchen remodeling cost \$18,549. Round the cost to the nearest

- a. ten**
  - b. hundred**
  - c. thousand**
  - d. ten-thousand**
- 

**76. Population.** The population of China was 1,339,724,852 on November 1, 2010. Round the population to the nearest

- a. billion**
- b. hundred-million**
- c. million**

**Solution**

- a. 1,000,000,000
  - b. 1,300,000,000
  - c. 1,340,000,000
- 

**77. Astronomy.** The average distance between Earth and the sun is 149,597,888 kilometers. Round the distance to the nearest

- a. hundred-million**

**b. ten-million**

**c. million**

---

**78. Grocery Shopping.** Hot dogs are sold in packages of 10, but hot dog buns come in packs of eight. What is the smallest number that makes the hot dogs and buns come out even?

**Solution**

40

---

**79. Grocery Shopping.** Paper plates are sold in packages of 12 and party cups come in packs of eight. What is the smallest number that makes the plates and cups come out even?

## Exercises: Writing Exercises

Instructions: For questions 80-83, answer the given writing exercises.

**80. Give an everyday example where it helps to round numbers.**

---

**81. If a number is divisible by 2 and by 3 why is it also divisible by 6?**

---

**82. What is the difference between prime numbers and composite numbers?**

**Solution**

Answers may vary.

---

**83. Explain in your own words how to find the prime factorization of a composite number, using any method you prefer.**

# EXERCISES: INTRODUCTION TO THE LANGUAGE OF ALGEBRA (1.2)

---

## Exercises: Use Variables and Algebraic Symbols

Instructions: For questions 1-14, translate from algebra to English.

1.  $16 - 9$

**Solution**

16 minus 9, the difference of sixteen and nine

---

2.  $3 \cdot 9$

---

3.  $28 \div 4$

**Solution**

28 divided by 4, the quotient of twenty-eight and four

---

4.  $x + 11$

---

5.  $(2)(7)$

**Solution**

2 times 7, the product of two and seven

---

6.  $(4)(8)$

---

7.  $14 < 21$

**Solution**

fourteen is less than twenty-one

---

8.  $17 < 35$

---

9.  $36 \geq 19$

**Solution**

thirty-six is greater than or equal to nineteen

---

10.  $6n = 36$

---

11.  $y - 1 > 6$

**Solution**

$y$  minus 1 is greater than 6, the difference of  $y$  and one is greater than six

---

12.  $y - 4 > 8$

---

13.  $2 \leq 18 \div 6$

**Solution**

2 is less than or equal to 18 divided by 6; two is less than or equal to the quotient of eighteen and six

---

14.  $a \neq 1 \cdot 12$

---

### Exercises: Expression or Equation

Instructions: For questions 15-20, determine if each is an expression or an equation.

15.  $9 \cdot 6 = 54$

**Solution**

equation

---

16.  $7 \cdot 9 = 63$

---

17.  $5 \cdot 4 + 3$

**Solution**

expression

---

**18.**  $x + 7$ 

---

**19.**  $x + 9$

**Solution**expression

---

**20.**  $y - 5 = 25$ 

---

## Exercises: Simplify Expressions Using the Order of Operations

Instructions: For questions 21-24, simplify each expression.

**21.**  $5^3$

**Solution**

125

---

**22.**  $8^3$ 

---

**23.**  $2^8$

**Solution**

256

---

24.  $10^5$

---

### Exercises: Simplify Using Order of Operations

Instructions: For questions 25-46, simplify using the order of operations.

25.  $3 + 8 \cdot 5$

**Solution**

43

---

26.  $2 + 6 \cdot 3$

---

27.  $(3 + 8) \cdot 5$

**Solution**

55

---

28.  $(2 + 6) \cdot 3$

---

29.  $2^3 - 12 \div (9 - 5)$

**Solution**

5

---

30.  $3^2 - 18 \div (11 - 5)$

31.  $3 \cdot 8 + 5 \cdot 2$

**Solution**

34

---

32.  $4 \cdot 7 + 3 \cdot 5$

33.  $2 + 8(6 + 1)$

**Solution**

58

---

34.  $4 + 6(3 + 6)$

35.  $4 \cdot 12/8$

**Solution**

6

---

36.  $2 \cdot 36/6$

---

37.  $(6 + 10) \div (2 + 2)$

**Solution**

4

---

38.  $(9 + 12) \div (3 + 4)$

---

39.  $20 \div 4 + 6 \cdot 5$

**Solution**

35

---

40.  $33 \div 3 + 8 \cdot 2$

---

41.  $3^2 + 7^2$

**Solution**

58

---

42.  $(3 + 7)^2$

---

**43.**  $3(1 + 9 \cdot 6) - 4^2$

**Solution**149

---

**44.**  $5(2 + 8 \cdot 4) - 7^2$ 

---

**45.**  $2[1 + 3(10 - 2)]$

**Solution**50

---

**46.**  $5[2 + 4(3 - 2)]$ 

---

### Exercises: Evaluate an Expression

Instructions: For questions 47-60, evaluate the expressions.

**47.**  $7x + 8$  when  $x = 2$

**Solution**22

---

**48.**  $8x - 6$  when  $x = 7$

---

**49.**  $x^2$  when  $x = 12$

**Solution**

144

---

**50.**  $x^3$  when  $x = 5$

---

**51.**  $x^5$  when  $x = 2$

**Solution**

32

---

**52.**  $4^x$  when  $x = 2$

---

**53.**  $x^2 + 3x - 7$  when  $x = 4$

**Solution**

21

---

**54.**  $6x + 3y - 9$  when  
 $x = 6, y = 9$

---

55.  $(x - y)^2$  when

$x = 10, y = 7$

**Solution**

9

---

56.  $(x + y)^2$  when

$x = 6, y = 9$

---

57.  $a^2 + b^2$  when

$a = 3, b = 8$

**Solution**

73

---

58.  $r^2 - s^2$  when

$r = 12, s = 5$

---

59.  $2l + 2w$  when

$l = 15, w = 12$

**Solution**

54

---

60.  $2l + 2w$  when

$l = 18, w = 14$

---

## Exercises: Simplify Expressions by Combining Like Terms

Instructions: For questions 61-64, identify the coefficient of each term.

**61.**  $8a$

**Solution**

8

---

**62.**  $13m$

---

**63.**  $5r^2$

**Solution**

5

---

**64.**  $6x^3$

---

## Exercises: Identify Like Terms

Instructions: For questions 65-68, identify the like terms.

65.  $x^3, 8x, 14, 8y, 5, 8x^3$

**Solution**

$x^3$  and  $8x^3$ , 14 and 5

---

66.  $6z, 3w^2, 1, 6z^2, 4z, w^2$ 

---

67.  $9a, a^2, 16, 16b^2, 4, 9b^2$

**Solution**

16 and 4,  $16b^2$  and  $9b^2$ 

---

68.  $3, 25r^2, 10s, 10r, 4r^2, 3s$ 

---

### Exercises: Identify Terms in an Expression

Instructions: For questions 69-72, identify the terms in each expression.

69.  $15x^2 + 6x + 2$

**Solution**

$15x^2, 6x, 2$ 

---

70.  $11x^2 + 8x + 5$

---

71.  $10y^3 + y + 2$

**Solution**

$10y^3, y, 2$

---

72.  $9y^3 + y + 5$

---

### Exercises: Simplify by Combining Like Terms

Instructions: For questions 73-82, simplify the expressions by combining like terms.

73.  $10x + 3x$

**Solution**

$13x$

---

74.  $15x + 4x$

---

75.  $4c + 2c + c$

**Solution**

$$7c$$

---

$$76. 6y + 4y + y$$

---

$$77. 7u + 2 + 3u + 1$$

**Solution**

$$10u + 3$$

---

$$78. 8d + 6 + 2d + 5$$

---

$$79. 10a + 7 + 5a - 2 + 7a - 4$$

**Solution**

$$22a + 1$$

---

$$80. 7c + 4 + 6c - 3 + 9c - 1$$

---

$$81. 3x^2 + 12x + 11 + 14x^2 + 8x + 5$$

**Solution**

$$17x^2 + 20x + 16$$

---

$$82. 5b^2 + 9b + 10 + 2b^2 + 3b - 4$$

---

## Exercises: Translate an English Phrase to an Algebraic Expression

Instructions: For questions 83-94, translate the phrases into algebraic expressions.

**83. the difference of 14 and 9**

**Solution**

$$14 - 9$$

---

**84. the difference of 19 and 8**

---

**85. the product of 9 and 7**

**Solution**

$$9 \cdot 7$$

---

**86. the product of 8 and 7**

---

**87. the quotient of 36 and 9**

**Solution**

$$36 \div 9$$

---

**88. the quotient of 42 and 7**

---

**89. the sum of  $8x$  and  $3x$**

**Solution**

$$8x + 3x$$

---

**90. the sum of  $13x$  and  $3x$**

---

**91. the quotient of  $y$  and 3**

**Solution**

$$\frac{y}{3}$$

---

**92. the quotient of  $y$  and 8**

---

**93. eight times the difference of  $y$  and nine**

**Solution**

$$8(y - 9)$$

---

**94. seven times the difference of  $y$  and one**

---

## Exercises: Word Problems

Instructions: For questions 95-98, write an expression for the given word problems.

**95. Eric has rock and classical CDs in his car. The number of rock CDs is 3 more than the number of classical CDs. Let  $c$  represent the number of classical CDs. Write an expression for the number of rock CDs.**

**Solution**

$$c + 3$$

---

**96. The number of girls in a second-grade class is 4 less than the number of boys. Let  $b$  represent the number of boys. Write an expression for the number of girls.**

---

**97. Greg has nickels and pennies in his pocket. The number of pennies is seven less than twice the number of nickels. Let  $n$  represent the number of nickels. Write an expression for the number of pennies.**

**Solution**

$$2n - 7$$

---

**98. Jeannette has \$5 and \$10 bills in her wallet. The number of fives is three more than six times the number of tens. Let  $t$  represent the number of tens. Write an expression for the number of fives.**

---

## Exercises: Everyday Math

Instructions: For questions 99-100, answer the given everyday math word problems.

**99. Car insurance.** Justin's car insurance has a \$750 deductible per incident. This means that he pays \$750 and his insurance company will pay all costs beyond \$750. If Justin files a claim for \$2,100:

a. how much will he pay?

b. how much will his insurance company pay?

**Solution**

a. \$750

b. \$1,350

---

**100. Home insurance.** Armando's home insurance has a \$2,500 deductible per incident. This means that he pays \$2,500 and the insurance company will pay all costs beyond \$2,500. If Armando files a claim for \$19,400:

a. how much will he pay?

b. how much will the insurance company pay?

---

## Exercises: Writing Exercises

Instructions: For questions 101-104, answer the given writing exercises.

**101. Explain the difference between an expression and an equation.**

**Solution**

Answers may vary

---

**102. Why is it important to use the order of operations to simplify an expression?**

---

**103. Explain how you identify the like terms in the expression  $8a^2 + 4a + 9 - a^2 - 1$ .**

**Solution**

Answers may vary

---

**104. Explain the difference between the phrases “4 times the sum of  $x$  and  $y$ ” and “the sum of 4 times  $x$  and  $y$ .”**

# EXERCISES: INTEGERS (1.3)

---

## Exercises: Multiply Integers

Instructions: For questions 1-8, multiply.

1.  $-4 \cdot 8$

**Solution**

$-32$

---

2.  $-3 \cdot 9$

---

3.  $9(-7)$

**Solution**

$-63$

---

4.  $13(-5)$

---

5.  $-1 \cdot 6$

**Solution**

$-6$

---

6.  $-1 \cdot 3$

---

7.  $-1(-14)$

**Solution**

14

---

8.  $-1(-19)$

---

## Exercises: Divide Integers

Instructions: For questions 9-14, divide.

9.  $-24 \div 6$

**Solution**

$-4$

---

10.  $35 \div (-7)$

---

**11.**  $-52 \div (-4)$

**Solution**

$13$ 

---

**12.**  $-84 \div (-6)$

**13.**  $-180 \div 15$

**Solution**

$-12$ 

---

**14.**  $-192 \div 12$ 

---

## Exercises: Simplify Expressions with Integers

Instructions: For questions 15-32, simplify each expression.

**15.**  $5(-6) + 7(-2) - 3$

**Solution**

$-47$ 

---

**16.**  $8(-4) + 5(-4) - 6$

---

17.  $(-2)^6$

**Solution**

64

---

18.  $(-3)^5$

---

19.  $-4^2$

**Solution**

-16

---

20.  $-6^2$

---

21.  $-3(-5)(6)$

**Solution**

90

---

22.  $-4(-6)(3)$

---

23.  $(8 - 11)(9 - 12)$

**Solution**

9

---

24.  $(6 - 11)(8 - 13)$ 

---

25.  $26 - 3(2 - 7)$

**Solution**41

---

26.  $23 - 2(4 - 6)$ 

---

27.  $65 \div (-5) + (-28) \div (-7)$

**Solution**-9

---

28.  $52 \div (-4) + (-32) \div (-8)$ 

---

29.  $9 - 2[3 - 8(-2)]$

**Solution**-29

---

30.  $11 - 3[7 - 4(-2)]$

---

31.  $(-3)^2 - 24 \div (8 - 2)$

**Solution**

5

---

32.  $(-4)^2 - 32 \div (12 - 4)$

---

### Exercises: Evaluate Variable Expressions with Integers

Instructions: For questions 33-50, evaluate each expression.

33.  $y + (-14)$  when

a.  $y = -33$

b.  $y = 30$

**Solution**

a.  $-47$

b.  $16$

---

34.  $x + (-21)$  when

a.  $x = -27$

b.  $x = 44$

---

35.

a.  $a + 3$  when  $a = -7$

b.  $-a + 3$  when  $a = -7$

**Solution**

a.  $-4$

b.  $10$

---

**36.**

a.  $d + (-9)$  when  $d = -8$

b.  $-d + (-9)$  when  $d = -8$

---

**37.  $m + n$  when**

$m = -15, n = 7$

**Solution**

$-8$

---

**38.  $p + q$  when**

$p = -9, q = 17$

---

**39.  $r + s$  when**

$r = -9, s = -7$

**Solution**

$-16$

---

**40.**  $t + u$  when

$$t = -6, u = -5$$

---

**41.**  $(x + y)^2$  when

$$x = -3, y = 14$$

**Solution**

$$121$$

---

**42.**  $(y + z)^2$  when

$$y = -3, z = 15$$

---

**43.**  $-2x + 17$  when

a.  $x = 8$

b.  $x = -8$

**Solution**

a. 1

b. 33

---

**44.**  $-5y + 14$  when

a.  $y = 9$

b.  $y = -9$

---

**45.**  $10 - 3m$  when

a.  $m = 5$

b.  $m = -5$

**Solution**

a.  $-5$

b.  $25$ 

---

**46.**  $18 - 4n$  when

a.  $n = 3$

b.  $n = -3$ 

---

**47.**  $2w^2 - 3w + 7$  when  $w = -2$

**Solution**

$21$ 

---

**48.**  $3u^2 - 4u + 5$  when  $u = -3$ 

---

**49.**  $9a - 2b - 8$  when

$a = -6, b = -3$

**Solution**

$-56$ 

---

**50.**  $7m - 4n - 2$  when

$m = -4, n = -9$ 

---

## Exercises: Translate English Phrases to Algebraic Expressions

Instructions: For questions 51-64, translate to an algebraic expression and simplify if possible.

**51. the sum of 3 and  $-15$ , increased by 7**

**Solution**

$$(3 + (-15)) + 7$$

$$(3 + (-15)) + 7 = -5$$

---

**52. the sum of  $-8$  and  $-9$ , increased by 23**

---

**53. the difference of 10 and  $-18$**

**Solution**

$$10 - (-18)$$

$$10 - (-18) = 28$$

---

**54. subtract 11 from  $-25$**

---

**55. the difference of  $-5$  and  $-30$**

**Solution**

$$-5 - (-30)$$

$$-5 - (-30) = 25$$

---

**56. subtract  $-6$  from  $-13$**

---

**57. the product of  $-3$  and  $15$**

**Solution**

$$-3 \cdot 15$$

$$-3 \cdot 15 = -45$$

---

**58. the product of  $-4$  and  $16$**

---

**59. the quotient of  $-60$  and  $-20$**

**Solution**

$$-60 \div (-20)$$

$$-60 \div (-20) = 3$$

---

**60. the quotient of  $-40$  and  $-20$**

---

**61. the quotient of  $-6$  and the sum of  $a$  and  $b$**

**Solution**

$$\frac{-6}{a + b}$$

---

62. the quotient of  $-7$  and the sum of  $m$  and  $n$

---

63. the product of  $-10$  and the difference of  $p$  and  $q$

**Solution**

$$-10(p - q)$$

---

64. the product of  $-13$  and the difference of  $c$  and  $d$

---

## Exercises: Use Integers in Applications

Instructions: For questions 65-72, solve the given word problems.

65. **Temperature.** On January 15, the high temperature in Anaheim, California, was  $84^{\circ}$ . That same day, the high temperature in Embarrass, Minnesota was  $-12^{\circ}$ . What was the difference between the temperature in Anaheim and the temperature in Embarrass?

**Solution**

$$96^{\circ}$$

---

66. **Temperature.** On January 21, the high temperature in Palm Springs, California, was  $89^{\circ}$ , and the high temperature in Whitefield, New Hampshire was  $-31^{\circ}$ . What was the difference between the temperature in Palm Springs and the temperature in Whitefield?

---

**67. Football.** At the first down, the Chargers had the ball on their 25 yard line. On the next three downs, they lost 6 yards, gained 10 yards, and lost 8 yards. What was the yard line at the end of the fourth down?

**Solution**

21

---

**68. Football.** At the first down, the Steelers had the ball on their 30 yard line. On the next three downs, they gained 9 yards, lost 14 yards, and lost 2 yards. What was the yard line at the end of the fourth down?

---

**69. Checking Account.** Mayra has \$124 in her checking account. She writes a check for \$152. What is the new balance in her checking account?

**Solution**

—\$28

---

**70. Checking Account.** Selina has \$165 in her checking account. She writes a check for \$207. What is the new balance in her checking account?

---

**71. Checking Account.** Diontre has a balance of —\$38 in his checking account. He deposits \$225 to the account. What is the new balance?

**Solution**

\$187

---

**72. Checking Account.** Reymonte has a balance of —\$49 in his checking account. He deposits \$281 to the account. What is the new balance?

---

## Exercises: Everyday Math

Instructions: For questions 73-74, solve the given everyday math word problems.

**73. Stock market.** Javier owns 300 shares of stock in one company. On Tuesday, the stock price dropped \$12 per share. What was the total effect on Javier's portfolio?

**Solution**

—\$3600

---

**74. Weight loss.** In the first week of a diet program, eight women lost an average of 3 pounds each. What was the total weight change for the eight women?

---

## Exercises: Writing Exercises

Instructions: For questions 75-78, answer the given writing exercises.

**75. In your own words, state the rules for multiplying integers.**

**Solution**

Answers may vary

---

**76. In your own words, state the rules for dividing integers.**

---

**77. Why is  $-2^4 \neq (-2)^4$ ?**

**Solution**

Answers may vary

---

**78. Why is  $-4^3 = (-4)^3$ ?**

# EXERCISES: FRACTIONS (1.4)

---

## Exercises: Find Equivalent Fractions

Instructions: For questions 1-4, find three fractions equivalent to the given fraction. Show your work, using figures or algebra.

1.  $\frac{3}{8}$

**Solution**

$$\frac{6}{16}, \frac{9}{24}, \frac{12}{32} \text{ (Answers may vary)}$$

---

2.  $\frac{5}{8}$

3.  $\frac{5}{9}$

**Solution**

$$\frac{10}{18}, \frac{15}{27}, \frac{20}{36} \text{ (Answers may vary)}$$

---

4.  $\frac{1}{8}$

---

## Exercises: Simplify Fractions

Instructions: For questions 5-14, simplify.

5.  $-\frac{40}{88}$

**Solution**

$$-\frac{5}{11}$$

---

6.  $-\frac{63}{99}$

**Solution**

$$-\frac{12}{7}$$

---

8.  $-\frac{104}{48}$

9.  $\frac{120}{252}$

**Solution**

$$\frac{10}{21}$$

---

$$10. \frac{182}{294}$$

---

$$11. -\frac{3x}{12y}$$

**Solution**

$$-\frac{x}{4y}$$

---

$$12. -\frac{4x}{32y}$$

---

$$13. \frac{14x^2}{21y}$$

**Solution**

$$\frac{2x^2}{3y}$$

---

$$14. \frac{24a}{32b^2}$$

---

## Exercises: Multiply Fractions

Instructions: For questions 15-30, multiply.

15.  $\frac{3}{4} \cdot \frac{9}{10}$

**Solution**

$$\frac{27}{40}$$

---

16.  $\frac{4}{5} \cdot \frac{2}{7}$

**Solution**

$$\frac{1}{4}$$

---

17.  $-\frac{2}{3} \left( -\frac{3}{8} \right)$

**Solution**

$$\frac{1}{4}$$

---

18.  $-\frac{3}{4} \left( -\frac{4}{9} \right)$

**Solution**

19.  $-\frac{5}{9} \cdot \frac{3}{10}$

**Solution**

$$-\frac{1}{6}$$

---

$$20. -\frac{3}{8} \cdot \frac{4}{15}$$

---

$$21. \left(-\frac{14}{15}\right) \left(\frac{9}{20}\right)$$

**Solution**

$$-\frac{21}{50}$$

---

$$22. \left(-\frac{9}{10}\right) \left(\frac{25}{33}\right)$$

---

$$23. \left(-\frac{63}{84}\right) \left(-\frac{44}{90}\right)$$

**Solution**

$$\frac{11}{30}$$

---

$$24. \left(-\frac{63}{60}\right) \left(-\frac{40}{88}\right)$$

---

$$25. 4 \cdot \frac{5}{11}$$

**Solution**

$$\frac{20}{11}$$

---

$$26. 5 \cdot \frac{8}{3}$$

$$27. \frac{3}{7} \cdot 21n$$

**Solution**

$$9n$$

---

$$28. \frac{5}{6} \cdot 30m$$

$$29. (-8) \left( \frac{17}{4} \right)$$

**Solution**

$$-34$$

---

$$30. (-1) \left( -\frac{6}{7} \right)$$

---

## Exercises: Divide Fractions

Instructions: For questions 31-44, divide.

31.  $\frac{3}{4} \div \frac{2}{3}$

**Solution**

$$\frac{9}{8}$$

---

32.  $\frac{4}{5} \div \frac{3}{4}$

33.  $-\frac{7}{9} \div \left(-\frac{7}{4}\right)$

**Solution**

$$1$$

---

34.  $-\frac{5}{6} \div \left(-\frac{5}{6}\right)$

35.  $\frac{3}{4} \div \frac{x}{11}$

**Solution**

$$\frac{33}{4x}$$

---

$$36. \frac{2}{5} \div \frac{y}{9}$$

---

$$37. \frac{5}{18} \div \left(-\frac{15}{24}\right)$$

**Solution**

$$-\frac{4}{9}$$

---

$$38. \frac{7}{18} \div \left(-\frac{14}{27}\right)$$

---

$$39. \frac{8u}{15} \div \frac{12v}{25}$$

**Solution**

$$\frac{10u}{9v}$$

---

$$40. \frac{12r}{25} \div \frac{18s}{35}$$

---

$$41. -5 \div \frac{1}{2}$$

**Solution**

$$-10$$

---

$$42. -3 \div \frac{1}{4}$$

---

$$43. \frac{3}{4} \div (-12)$$

**Solution**

$$-\frac{1}{16}$$

---

$$44. -15 \div \left(-\frac{5}{3}\right)$$

---

### Exercises: Simplify by Dividing

Instructions: For questions 45-50, simplify.

$$45. \frac{\frac{8}{21}}{\frac{12}{35}}$$

**Solution**

$$-\frac{10}{9}$$

---

$$46. \frac{\frac{9}{16}}{\frac{33}{40}}$$

---

$$47. \frac{\frac{4}{5}}{2}$$

**Solution**

$$-\frac{2}{5}$$

---

$$48. \frac{\frac{5}{3}}{\frac{3}{10}}$$

---

$$49. \frac{\frac{\frac{m}{3}}{n}}{\frac{2}{2}}$$

**Solution**

$$\frac{2m}{3n}$$

---

$$50. \frac{\frac{\frac{3}{8}}{y}}{\frac{12}{12}}$$

---

## Exercises: Simplify Expressions Written with a Fraction Bar

Instructions: For questions 51-70, simplify.

51.  $\frac{22 + 3}{10}$

**Solution**

$$\frac{5}{2}$$

---

52.  $\frac{19 - 4}{6}$

53.  $\frac{48}{24 - 15}$

**Solution**

$$\frac{16}{3}$$

---

54.  $\frac{46}{4 + 4}$

55.  $\frac{-6 + 6}{8 + 4}$

**Solution**0

---

56.  $\frac{-6 + 3}{17 - 8}$ 

---

57.  $\frac{4 \cdot 3}{6 \cdot 6}$

**Solution**

$\frac{1}{3}$ 

---

58.  $\frac{6 \cdot 6}{9 \cdot 2}$ 

---

59.  $\frac{4^2 - 1}{25}$

**Solution**

$\frac{3}{5}$ 

---

60.  $\frac{7^2 + 1}{60}$ 

---

$$61. \frac{8 \cdot 3 + 2 \cdot 9}{14 + 3}$$

**Solution**

$$2\frac{8}{17}$$

---

$$62. \frac{9 \cdot 6 - 4 \cdot 7}{22 + 3}$$

---

$$63. \frac{5 \cdot 6 - 3 \cdot 4}{4 \cdot 5 - 2 \cdot 3}$$

**Solution**

$$\frac{3}{5}$$

---

$$64. \frac{8 \cdot 9 - 7 \cdot 6}{5 \cdot 6 - 9 \cdot 2}$$

---

$$65. \frac{5^2 - 3^2}{3 - 5}$$

**Solution**

$$-8$$

---

$$66. \frac{6^2 - 4^2}{4 - 6}$$

---

$$67. \frac{7 \cdot 4 - 2(8 - 5)}{9 \cdot 3 - 3 \cdot 5}$$

**Solution**

$$\frac{11}{6}$$

---

$$68. \frac{9 \cdot 7 - 3(12 - 8)}{8 \cdot 7 - 6 \cdot 6}$$

---

$$69. \frac{9(8 - 2) - 3(15 - 7)}{6(7 - 1) - 3(17 - 9)}$$

**Solution**

$$\frac{5}{2}$$

---

$$70. \frac{8(9 - 2) - 4(14 - 9)}{7(8 - 3) - 3(16 - 9)}$$

---

## Exercises: Translate Phrases to Expressions with Fractions

Instructions: For questions 71-74, translate each English phrase into an algebraic expression.

**71. the quotient of  $r$  and the sum of  $s$  and 10**

**Solution**

$$\frac{r}{s + 10}$$

---

72. the quotient of  $A$  and the difference of 3 and  $B$

---

73. the quotient of the difference of  $x$  and  $y$ , and  $-3$

**Solution**

$$\frac{x - y}{-3}$$

---

74. the quotient of the sum of  $m$  and  $n$ , and  $4q$

## Exercises: Everyday Math

Instructions: For questions 75-78, answer the given everyday math word problems.

75. **Baking.** A recipe for chocolate chip cookies calls for  $\frac{3}{4}$  cup brown sugar. Imelda wants to double the recipe.

a. How much brown sugar will Imelda need? Show your calculation.

b. Measuring cups usually come in sets of  $\frac{1}{4}$ ,  $\frac{1}{3}$ ,  $\frac{1}{2}$ , and 1 cup. Draw a diagram to show two different ways that Imelda could measure the brown sugar needed to double the cookie recipe.

**Solution**

a.  $1\frac{1}{2}$  cups

b. Answers will vary

**76. Baking.** Nina is making 4 pans of fudge to serve after a music recital. For each pan, she needs  $\frac{2}{3}$  cup of condensed milk.

a. How much condensed milk will Nina need? Show your calculation.

b. Measuring cups usually come in sets of  $\frac{1}{4}$ ,  $\frac{1}{3}$ ,  $\frac{1}{2}$ , and 1 cup. Draw a diagram to show two different ways that Nina could measure the condensed milk needed for 4 pans of fudge.

**77. Portions.** Don purchased a bulk package of candy that weighs 5 pounds. He wants to sell the candy in little bags that hold  $\frac{1}{4}$  pound. How many little bags of candy can he fill from the bulk package?

**Solution**

20 bags

**78. Portions.** Kristen has  $\frac{3}{4}$  yards of ribbon that she wants to cut into 6 equal parts to make hair ribbons for her daughter's 6 dolls. How long will each doll's hair ribbon be?

## Exercises: Writing Exercises

Instructions: For questions 79-82, answer the given writing exercises.

**79. Rafael wanted to order half a medium pizza at a restaurant. The waiter told him that a medium pizza could be cut into 6 or 8 slices. Would he prefer 3 out of 6 slices or 4 out of 8 slices? Rafael replied that since he wasn't very hungry, he would prefer 3 out of 6 slices. Explain what is wrong with Rafael's reasoning.**

**Solution**

Answers may vary

---

**80. Give an example from everyday life that demonstrates how  $\frac{1}{2} \cdot \frac{2}{3}$  is  $\frac{1}{3}$ .**

---

**81. Explain how you find the reciprocal of a fraction.**

**Solution**

Answers may vary

---

**82. Explain how you find the reciprocal of a negative number.**

---

## Exercises: Add Fractions with a Common Denominator

Instructions: For questions 83-92, add.

**83.  $\frac{6}{13} + \frac{5}{13}$**

**Solution**

$$\frac{11}{13}$$

---

$$84. \frac{4}{15} + \frac{7}{15}$$

---

$$85. \frac{x}{4} + \frac{3}{4}$$

**Solution**

$$\frac{x+3}{4}$$

---

$$86. \frac{8}{q} + \frac{6}{q}$$

---

$$87. -\frac{3}{16} + \left(-\frac{7}{16}\right)$$

**Solution**

$$-\frac{5}{8}$$

---

$$88. -\frac{5}{16} + \left(-\frac{9}{16}\right)$$

---

$$89. -\frac{8}{17} + \frac{15}{17}$$

**Solution**

$$\frac{7}{17}$$

---

$$90. -\frac{9}{19} + \frac{17}{19}$$

**Solution**

$$-\frac{16}{19}$$

---

$$91. \frac{6}{13} + \left(-\frac{10}{13}\right) + \left(-\frac{12}{13}\right)$$

**Solution**

$$-\frac{16}{13}$$

---

$$92. \frac{5}{12} + \left(-\frac{7}{12}\right) + \left(-\frac{11}{12}\right)$$

---

## Exercises: Subtract Fractions with a Common Denominator

Instructions: For questions 93-106, subtract.

$$93. \frac{11}{15} - \frac{7}{15}$$

**Solution**

$$\frac{4}{15}$$

---

$$94. \frac{9}{13} - \frac{4}{13}$$

---

$$95. \frac{11}{12} - \frac{5}{12}$$

**Solution**

$$\frac{1}{2}$$

---

$$96. \frac{7}{12} - \frac{5}{12}$$

---

$$97. \frac{19}{21} - \frac{4}{21}$$

**Solution**

$$\frac{5}{7}$$

---

$$98. \frac{17}{21} - \frac{8}{21}$$

---

$$99. \frac{5y}{8} - \frac{7}{8}$$

**Solution**

$$\frac{5y - 7}{8}$$

---

$$100. \frac{11z}{13} - \frac{8}{13}$$

---

$$101. -\frac{23}{u} - \frac{15}{u}$$

**Solution**

$$-\frac{38}{u}$$

---

$$102. -\frac{29}{v} - \frac{26}{v}$$

---

$$103. -\frac{3}{5} - \left(-\frac{4}{5}\right)$$

**Solution**

$$\frac{1}{5}$$

---

$$104. -\frac{3}{7} - \left(-\frac{5}{7}\right)$$

---

$$105. -\frac{7}{9} - \left(-\frac{5}{9}\right)$$

**Solution**

$$-\frac{2}{9}$$

---

$$106. -\frac{8}{11} - \left(-\frac{5}{11}\right)$$

---

## Exercises: Mixed Practice

Instructions: For questions 107-114, simplify.

$$107. -\frac{5}{18} \cdot \frac{9}{10}$$

**Solution**

$$-\frac{1}{4}$$

---

$$108. -\frac{3}{14} \cdot \frac{7}{12}$$

---

$$109. \frac{n}{5} - \frac{4}{5}$$

**Solution**

$$\frac{n-4}{5}$$

---

$$110. \frac{6}{11} - \frac{s}{11}$$

---

$$111. -\frac{7}{24} + \frac{2}{24}$$

**Solution**

$$-\frac{5}{24}$$

---

$$112. -\frac{5}{18} + \frac{1}{18}$$

---

$$113. \frac{8}{15} \div \frac{12}{5}$$

**Solution**

$$\frac{2}{9}$$

---

$$114. \frac{7}{12} \div \frac{9}{28}$$

---

## Exercises: Add or Subtract Fractions with Different Denominators

Instructions: For questions 115-138, add or subtract.

115.  $\frac{1}{2} + \frac{1}{7}$

**Solution**

$$\frac{9}{14}$$

---

116.  $\frac{1}{3} + \frac{1}{8}$

117.  $\frac{1}{3} - \left(-\frac{1}{9}\right)$

**Solution**

$$\frac{4}{9}$$

---

118.  $\frac{1}{4} - \left(-\frac{1}{8}\right)$

119.  $\frac{7}{12} + \frac{5}{8}$

**Solution**

$$\frac{29}{24}$$

---

$$120. \frac{5}{12} + \frac{3}{8}$$

---

$$121. \frac{7}{12} - \frac{9}{16}$$

**Solution**

$$\frac{1}{48}$$

---

$$122. \frac{7}{16} - \frac{5}{12}$$

---

$$123. \frac{2}{3} - \frac{3}{8}$$

**Solution**

$$\frac{7}{24}$$

---

$$124. \frac{5}{6} - \frac{3}{4}$$

---

$$125. -\frac{11}{30} + \frac{27}{40}$$

**Solution**

$$\frac{37}{120}$$

---

$$126. -\frac{9}{20} + \frac{17}{30}$$

**Solution**

$$127. -\frac{13}{30} + \frac{25}{42}$$

**Solution**

$$\frac{17}{105}$$

---

$$128. -\frac{23}{30} + \frac{5}{48}$$

**Solution**

$$129. -\frac{39}{56} - \frac{22}{35}$$

**Solution**

$$-\frac{53}{40}$$

---

$$130. -\frac{33}{49} - \frac{18}{35}$$

**Solution**

$$131. -\frac{2}{3} - \left(-\frac{3}{4}\right)$$

**Solution**

$$\frac{1}{12}$$

---

$$132. -\frac{3}{4} - \left(-\frac{4}{5}\right)$$

---

$$133. 1 + \frac{7}{8}$$

**Solution**

$$\frac{15}{8}$$

---

$$134. 1 - \frac{3}{10}$$

---

$$135. \frac{x}{3} + \frac{1}{4}$$

**Solution**

$$\frac{4x + 3}{12}$$

---

$$136. \frac{y}{2} + \frac{2}{3}$$

---

137.  $\frac{y}{4} - \frac{3}{5}$

**Solution**

$$\frac{4y - 12}{20}$$

---

138.  $\frac{x}{5} - \frac{1}{4}$

---

## Exercises: Mixed Practice

Instructions: For questions 139-152, simplify.

139.

a.  $\frac{2}{3} + \frac{1}{6}$

b.  $\frac{2}{3} \div \frac{1}{6}$

**Solution**

a.  $\frac{5}{6}$

b. 4

---

140.

a.  $-\frac{2}{5} - \frac{1}{8}$

b.  $-\frac{2}{5} \cdot \frac{1}{8}$

---

**141.**

a.  $\frac{5n}{6} \div \frac{8}{15}$

b.  $\frac{5n}{6} - \frac{8}{15}$

**Solution**

a.  $\frac{25n}{16}$

b.  $\frac{25n - 16}{30}$ 

---

**142.**

a.  $\frac{3a}{8} \div \frac{7}{12}$

b.  $\frac{3a}{8} - \frac{7}{12}$ 

---

**143.**  $-\frac{3}{8} \div \left(-\frac{3}{10}\right)$

**Solution**

$\frac{5}{4}$ 

---

**144.**  $-\frac{5}{12} \div \left(-\frac{5}{9}\right)$ 

---

**145.**  $-\frac{3}{8} + \frac{5}{12}$

**Solution**

$$\frac{1}{24}$$

---

$$146. -\frac{1}{8} + \frac{7}{12}$$

---

$$147. \frac{5}{6} - \frac{1}{9}$$

**Solution**

$$\frac{13}{18}$$

---

$$148. \frac{5}{9} - \frac{1}{6}$$

---

$$149. -\frac{7}{15} - \frac{y}{4}$$

**Solution**

$$\frac{-28 - 15y}{60}$$

---

$$150. -\frac{3}{8} - \frac{x}{11}$$

---

$$151. \frac{11}{12a} \cdot \frac{9a}{16}$$

**Solution**

$$\frac{33}{64}$$

---

$$152. \frac{10y}{13} \cdot \frac{8}{15y}$$

---

### Exercises: Use the Order of Operations to Simplify Complex Fractions

Instructions: For questions 153-174, simplify.

$$153. \frac{2^3 + 4^2}{\left(\frac{2}{3}\right)^2}$$

**Solution**

$$54$$

---

$$154. \frac{3^3 - 3^2}{\left(\frac{3}{4}\right)^2}$$

---

$$155. \frac{\left(\frac{3}{5}\right)^2}{\left(\frac{3}{7}\right)^2}$$

**Solution**

$$\frac{49}{25}$$

---

$$156. \frac{\left(\frac{3}{4}\right)^2}{\left(\frac{5}{8}\right)^2}$$

$$157. \frac{2}{\frac{1}{3} + \frac{1}{5}}$$

**Solution**

$$\frac{15}{4}$$

---

$$158. \frac{5}{\frac{1}{4} + \frac{1}{3}}$$

$$159. \frac{\frac{7}{8} - \frac{2}{3}}{\frac{1}{2} + \frac{3}{8}}$$

**Solution**

$$\frac{5}{21}$$

---

$$160. \frac{\frac{3}{4} - \frac{3}{5}}{\frac{1}{4} + \frac{2}{5}}$$

---

$$161. \frac{1}{2} + \frac{2}{3} \cdot \frac{5}{12}$$

**Solution**

$$\frac{7}{9}$$

---

$$162. \frac{1}{3} + \frac{2}{5} \cdot \frac{3}{4}$$

---

$$163. 1 - \frac{3}{5} \div \frac{1}{10}$$

**Solution**

$$-5$$

---

$$164. 1 - \frac{5}{6} \div \frac{1}{12}$$

---

$$165. \frac{2}{3} + \frac{1}{6} + \frac{3}{4}$$

**Solution**

$$\frac{19}{12}$$

---

**166.**  $\frac{2}{3} + \frac{1}{4} + \frac{3}{5}$

---

**167.**  $\frac{3}{8} - \frac{1}{6} + \frac{3}{4}$

**Solution**

$$\frac{23}{24}$$

---

**168.**  $\frac{2}{5} + \frac{5}{8} - \frac{3}{4}$

---

**169.**  $12 \left( \frac{9}{20} - \frac{4}{15} \right)$

**Solution**

$$\frac{11}{5}$$

---

**170.**  $8 \left( \frac{15}{16} - \frac{5}{6} \right)$

---

**171.**  $\frac{\frac{5}{8} + \frac{1}{6}}{\frac{19}{24}}$

**Solution**

1

---

$$172. \frac{\frac{1}{6} + \frac{3}{10}}{\frac{14}{30}}$$

---

$$173. \left( \frac{5}{9} + \frac{1}{6} \right) \div \left( \frac{2}{3} - \frac{1}{2} \right)$$

**Solution**

$$\frac{13}{3}$$

---

$$174. \left( \frac{3}{4} + \frac{1}{6} \right) \div \left( \frac{5}{8} - \frac{1}{3} \right)$$

---

## Exercises: Evaluate Variable Expressions with Fractions

Instructions: For questions 175-184, evaluate.

$$175. x + \left( -\frac{5}{6} \right) \text{ when}$$

$$\text{a. } x = \frac{1}{3}$$

$$\text{b. } x = -\frac{1}{6}$$

**Solution**

$$\text{a. } -\frac{1}{2}$$

$$\text{b. } -1$$

---

176.  $x + \left(-\frac{11}{12}\right)$  when

a.  $x = \frac{11}{12}$

b.  $x = \frac{3}{4}$

---

177.  $x - \frac{2}{5}$  when

a.  $x = \frac{3}{5}$

b.  $x = -\frac{3}{5}$

**Solution**

a.  $\frac{1}{5}$

b.  $-1$

---

178.  $x - \frac{1}{3}$  when

a.  $x = \frac{2}{3}$

b.  $x = -\frac{2}{3}$

---

179.  $\frac{7}{10} - w$  when

a.  $w = \frac{1}{2}$

b.  $w = -\frac{1}{2}$

**Solution**

a.  $\frac{1}{5}$   
 b.  $\frac{6}{5}$

---

180.  $\frac{5}{12} - w$  when

a.  $w = \frac{1}{4}$

b.  $w = -\frac{1}{4}$

---

181.  $2x^2y^3$  when  $x = -\frac{2}{3}$  and  $y = -\frac{1}{2}$

**Solution**

$$-\frac{1}{9}$$

---

182.  $8u^2v^3$  when  $u = -\frac{3}{4}$  and  $v = -\frac{1}{2}$

---

183.  $\frac{a+b}{a-b}$  when  $a = -3, b = 8$

**Solution**

$$-\frac{5}{11}$$

---

184.  $\frac{r-s}{r+s}$  when  $r = 10$ ,  $s = -5$

## Exercises: Everyday Math

Instructions: For questions 185-186, answer the given everyday math word problems.

**185. Decorating.** Laronda is making covers for the throw pillows on her sofa. For each pillow cover, she needs  $\frac{1}{2}$  yard of print fabric and  $\frac{3}{8}$  yard of solid fabric. What is the total amount of fabric Laronda needs for each pillow cover?

**Solution**

$$\frac{7}{8} \text{ yard}$$

---

**186. Baking.** Vanessa is baking chocolate chip cookies and oatmeal cookies. She needs  $\frac{1}{2}$  cup of sugar for the chocolate chip cookies and  $\frac{1}{4}$  of sugar for the oatmeal cookies. How much sugar does she need altogether?

---

## Exercises: Writing Exercises

Instructions: For questions 187-188, answer the given writing exercises.

**187. Why do you need a common denominator to add or subtract fractions? Explain.**

**Solution**

Answers may vary

---

**188. How do you find the LCD of 2 fractions?**

# EXERCISES: DECIMALS (1.5)

---

## Exercises: Name and Write Decimals

Instructions: For questions 1–8, write as a decimal.

**1. Twenty-nine and eighty-one hundredths**

**Solution**

29.81

---

**2. Sixty-one and seventy-four hundredths**

---

**3. Seven tenths**

**Solution**

0.7

---

**4. Six tenths**

---

**5. Twenty-nine thousandth**

**Solution**

0.029

---

**6. Thirty-five thousandths**

---

**7. Negative eleven and nine ten-thousandths**

**Solution**

−11.0009

---

**8. Negative fifty-nine and two ten-thousandths**

---

## Exercises: Name and Write Decimals

Instructions: For questions 9–16, name each decimal.

**9. 5.5**

**Solution**

five and five tenths

---

**10. 14.02**

---

**11. 8.71**

**Solution**

eight and seventy-one hundredths

---

**12. 2.64**

---

**13. 0.002**

**Solution**

two thousandths

---

**14. 0.479**

---

**15.  $-17.9$**

**Solution**

negative seventeen and nine tenths

---

**16.  $-31.4$**

---

## Exercises: Round Decimals

Instructions: For questions 17–20, round each number to the nearest tenth.

17. 0.67

**Solution**

0.7

---

18. 0.49

---

19. 2.84

**Solution**

2.8

---

20. 4.63

---

## Exercises: Round Decimals

Instructions: For questions 21–26, round each number to the nearest hundredth.

21. 0.845

**Solution**

0.85

---

22. 0.761

---

23. 0.299

**Solution**

0.30

---

24. 0.697

---

25. 4.098

**Solution**

4.10

---

26. 7.096

---

## Exercises: Round Decimals

Instructions: For questions 27–30, round each number to the nearest

- a. hundredth
- b. tenth
- c. whole number

27. 5.781

**Solution**

- a. 5.78
  - b. 5.8
  - c. 6
- 

28. 1.6381

---

29. 63.479

**Solution**

- a. 63.48
  - b. 63.5
  - c. 63
- 

30. 84.281

---

## Exercises: Add and Subtract Decimals

Instructions: For questions 31–48, add or subtract.

31.  $16.92 + 7.56$

**Solution**

24.48

---

32.  $248.25 - 91.29$

33.  $21.76 - 30.99$

**Solution**

−9.23

---

34.  $38.6 + 13.67$

35.  $-16.53 - 24.38$

**Solution**

−40.91

---

36.  $-19.47 - 32.58$

---

$$37. -38.69 + 31.47$$

**Solution**

$$-7.22$$

---

$$38. 29.83 + 19.76$$

---

$$39. 72.5 - 100$$

**Solution**

$$-27.5$$

---

$$40. 86.2 - 100$$

---

$$41. 15 + 0.73$$

**Solution**

$$15.73$$

---

$$42. 27 + 0.87$$

---

$$43. 91.95 - (-10.462)$$

**Solution**

$$102.212$$

---

**44.**  $94.69 - (-12.678)$

---

**45.**  $55.01 - 3.7$

**Solution**

51.31

---

**46.**  $59.08 - 4.6$

---

**47.**  $2.51 - 7.4$

**Solution**

-4.89

---

**48.**  $3.84 - 6.1$

---

## Exercises: Multiply and Divide Decimals

Instructions: For questions 49–62, multiply.

**49.**  $(0.24)(0.6)$

**Solution**

0.144

---

50.  $(0.81)(0.3)$

---

51.  $(5.9)(7.12)$

**Solution**

42.008

---

52.  $(2.3)(9.41)$

---

53.  $(-4.3)(2.71)$

**Solution**

-11.653

---

54.  $(-8.5)(1.69)$

---

55.  $(-5.18)(-65.23)$

**Solution**

337.8914

---

56.  $(-9.16)(-68.34)$

---

57.  $(0.06)(21.75)$

**Solution**

1.305

---

58.  $(0.08)(52.45)$

---

59.  $(9.24)(10)$

**Solution**

92.4

---

60.  $(6.531)(10)$

---

61.  $(55.2)(1000)$

**Solution**

55,200

---

62.  $(99.4)(1000)$

---

## Exercises: Multiply and Divide Decimals

Instructions: For questions 63–76, divide.

**63.**  $4.75 \div 25$

**Solution**

0.19

---

**64.**  $12.04 \div 43$

---

**65.**  $\$117.25 \div 48$

**Solution**

\$2.44

---

**66.**  $\$109.24 \div 36$

---

**67.**  $0.6 \div 0.2$

**Solution**

3

---

**68.**  $0.8 \div 0.4$

---

**69.**  $1.44 \div (-0.3)$

**Solution**

$-4.8$

---

**70.**  $1.25 \div (-0.5)$

**71.**  $-1.75 \div (-0.05)$

**Solution**

$35$

---

**72.**  $-1.15 \div (-0.05)$

**73.**  $5.2 \div 2.5$

**Solution**

$2.08$

---

**74.**  $6.5 \div 3.25$

**75.**  $11 \div 0.55$

**Solution**

$20$

---

$$76. 14 \div 0.35$$

---

## Exercises: Convert Decimals, Fractions and Percents

Instructions: For questions 77–98, write each decimal as a fraction.

$$77. 0.04$$

**Solution**

$$\frac{1}{25}$$

---

$$78. 0.19$$

---

$$79. 0.52$$

**Solution**

$$\frac{13}{25}$$

---

$$80. 0.78$$

---

$$81. 1.25$$

**Solution**

$$\frac{5}{4}$$

---

**82.** 1.35

---

**83.** 0.375

**Solution**

$$\frac{3}{8}$$

---

**84.** 0.464

---

**85.** 0.095

**Solution**

$$\frac{19}{200}$$

---

**86.** 0.085

---

## Exercises: Convert Decimals, Fractions and Percents

Instructions: For questions 87-98, convert each fraction to a decimal.

87.  $\frac{17}{20}$

**Solution**

0.85

---

88.  $\frac{13}{20}$

**Solution**

0.65

---

89.  $\frac{11}{4}$

**Solution**

2.75

---

90.  $\frac{17}{4}$

**Solution**

4.25

---

91.  $-\frac{310}{25}$

**Solution**

-12.4

---

$$92. -\frac{284}{25}$$

---

$$93. \frac{15}{11}$$

**Solution**

$$1.\overline{36}$$

---

$$94. \frac{18}{11}$$

---

$$95. \frac{15}{111}$$

**Solution**

$$0.\overline{135}$$

---

$$96. \frac{25}{111}$$

---

$$97. 2.4 + \frac{5}{8}$$

**Solution**

$$3.025$$

---

$$98.3.9 + \frac{9}{20}$$

---

## Exercises: Convert Decimals, Fractions and Percents

Instructions: For questions 99–108, convert each percent to a decimal.

99. 1%

**Solution**

0.01

---

100. 2%

---

101. 63%

**Solution**

0.63

---

102. 71%

---

203. 150%

**Solution**

1.5

---

104. 250%

---

105. 21.4%

**Solution**

0.214

---

106. 39.3%

---

107. 7.8%

**Solution**

0.078

---

108. 6.4%

---

## Exercises: Convert Decimals, Fractions and Percents

Instructions: For questions 109–118, convert each decimal to a percent.

**109. 0.01****Solution**

1%

---

**110. 0.03**

---

**111. 1.35****Solution**

135%

---

**112. 1.56**

---

**113. 3****Solution**

300%

---

**114. 4**

---

**115. 0.0875****Solution**

8.75%

---

**116.** 0.0625

---

**117.** 2.254

**Solution**

225.4%

---

**118.** 2.317

---

## Exercises: Everyday Math

Instructions: For questions 119–124, answer the given everyday math word problems.

**119. Salary Increase.** Danny got a raise and now makes \$58,965.95 a year. Round this number to the nearest

- a. dollar
- b. thousand dollars
- c. ten thousand dollars

**Solution**

- a. \$58,966
  - b. \$59,000
  - c. \$60,000
- 

**120. New Car Purchase.** Selena's new car cost \$23,795.95. Round this number to the nearest

- a. dollar

- b. thousand dollars
- c. ten thousand dollars

**121. Sales Tax.** Hyo Jin lives in San Diego. She bought a refrigerator for \$1,624.99 and when the clerk calculated the sales tax it came out to exactly \$142.186625. Round the sales tax to the nearest

- a. penny
- b. dollar

**Solution**

- a. \$142.19
- b. \$142

**122. Sales Tax.** Jennifer bought a \$1,038.99 dining room set for her home in Cincinnati. She calculated the sales tax to be exactly \$67.53435. Round the sales tax to the nearest

- a. penny
- b. dollar

**123. Paycheck.** Annie has two jobs. She gets paid \$14.04 per hour for tutoring at City College and \$8.75 per hour at a coffee shop. Last week she tutored for 8 hours and worked at the coffee shop for 15 hours.

- a. How much did she earn?
- b. If she had worked all 23 hours as a tutor instead of working both jobs, how much more would she have earned?

**Solution**

- a. \$243.57
- b. \$79.35

**124. Paycheck.** Jake has two jobs. He gets paid \$7.95 per hour at the college cafeteria and \$20.25 at the art gallery. Last week he worked 12 hours at the cafeteria and 5 hours at the art gallery.

- a. How much did he earn?
- b. If he had worked all 17 hours at the art gallery instead of working both jobs, how much more would he have earned?
- 

## Exercises: Writing Exercises

Instructions: For questions 119–124, answer the given writing exercises.

**125. How does knowing about US money help you learn about decimals?**

**Solution**

Answers may vary

---

**126. Explain how you write “three and nine hundredths” as a decimal.**

---

**127. Without solving the problem “44 is 80% of what number” think about what the solution might be. Should it be a number that is greater than 44 or less than 44? Explain your reasoning.**

**Solution**

Answers may vary

---

**128. When the Szetos sold their home, the selling price was 500% of what they had paid for the house 30 years ago. Explain what 500% means in this context.**

---

# EXERCISES: THE REAL NUMBERS (1.6)

---

## Exercises: Simplify Expressions with Square Roots

Instructions: For questions 1-12, simplify.

1.  $\sqrt{36}$

**Solution**

6

---

2.  $\sqrt{4}$

---

3.  $\sqrt{64}$

**Solution**

8

---

4.  $\sqrt{169}$

---

5.  $\sqrt{9}$

**Solution**

3

---

6.  $\sqrt{16}$ 

---

7.  $\sqrt{100}$

**Solution**10

---

8.  $\sqrt{144}$ 

---

9.  $-\sqrt{4}$

**Solution** $-2$ 

---

10.  $-\sqrt{100}$ 

---

11.  $-\sqrt{1}$

**Solution** $-1$ 

---

12.  $-\sqrt{121}$

---

### Exercises: Identify Integers, Rational Numbers, Irrational Numbers, and Real Numbers

Instructions: For questions 13-16, write as the ratio of two integers.

13.

a. 5

b. 3.19

**Solution**

a.  $\frac{5}{1}$

b.  $\frac{319}{100}$

---

14.

a. 8

b. 1.61

---

15.

a.  $-12$

b. 9.279

**Solution**

a.  $\frac{-12}{1}$

b.  $\frac{9297}{1000}$

---

16.

- a.  $-16$
- b.  $4.399$
- 

### Exercises: Identify Integers, Rational Numbers, Irrational Numbers, and Real Numbers

Instructions: For questions 17-20, list the

- a. rational numbers
- b. irrational numbers

17.  $0.75, 0.22\overline{3}, 1.39174\dots$ **Solution**

- a.  $0.75, 0.22\overline{3}$
- b.  $1.39174\dots$
- 

18.  $0.36, 0.94729\dots, 2.52\overline{8}$ 19.  $0.4\overline{5}, 1.919293\dots, 3.59$

**Solution**

a.  $0.4\overline{5}$ , 3.59

b. 1.919293...

20.  $0.1\overline{3}$ , 0.42982..., 1.875

### Exercises: Identify Integers, Rational Numbers, Irrational Numbers, and Real Numbers

Instructions: For questions 21-24, identify whether each number is rational or irrational.

21.

a.  $\sqrt{25}$

b.  $\sqrt{30}$

**Solution**

a. rational

b. irrational

22.

a.  $\sqrt{44}$

b.  $\sqrt{49}$

23.

a.  $\sqrt{164}$

b.  $\sqrt{169}$

**Solution**

a. irrational

b. rational

24.

a.  $\sqrt{225}$

b.  $\sqrt{216}$

### Exercises: Identify Integers, Rational Numbers, Irrational Numbers, and Real Numbers

Instructions: For questions 25-28, identify whether each number is a real number or not a real number.

25.

a.  $-\sqrt{81}$

b.  $\sqrt{-121}$

**Solution**

a. real number

b. not a real number

26.

- a.  $-\sqrt{64}$   
b.  $\sqrt{-9}$
- 

27.

- a.  $\sqrt{-36}$   
b.  $-\sqrt{144}$

**Solution**

- a. not a real number  
b. real number
- 

28.

- a.  $\sqrt{-49}$   
b.  $-\sqrt{144}$
- 

## Exercises: Identify Integers, Rational Numbers, Irrational Numbers, and Real Numbers

Instructions: For each set of numbers in questions 29-32, list the

- a. whole numbers
- b. integers
- c. rational numbers
- d. irrational numbers
- e. real numbers

29.  $-8, 0, 1.95286..., \frac{12}{5}, \sqrt{36}, 9$

**Solution**

a.  $0, \sqrt{36}, 9$

b.  $-8, 0, \sqrt{36}, 9$

c.  $-8, 0, \frac{12}{5}, \sqrt{36}, 9$

d.  $1.95286\dots$

e.  $-8, 0, 1.95286\dots, \frac{12}{5}, \sqrt{36}, 9$

30.  $-9, -3\frac{4}{9}, -\sqrt{9}, 0.40\overline{9}, \frac{11}{6}, 7$

31.  $-\sqrt{100}, -7, -\frac{8}{3}, -1, 0.77, 3\frac{1}{4}$

**Solution**

a. none

b.  $-\sqrt{100}, -7, -1$

c.  $-\sqrt{100}, -7, -\frac{8}{3}, -1, 0.77, 3\frac{1}{4}$

d. none

e.  $-\sqrt{100}, -7, -\frac{8}{3}, -1, 0.77, 3\frac{1}{4}$

32.  $-6, -\frac{5}{2}, 0, 0.\overline{714285}, 2\frac{1}{5}, \sqrt{14}$

## Exercises: Locate Fractions on the Number Line

Instructions: For questions 33-40, locate the numbers on a number line.

33.  $\frac{3}{5}, \frac{8}{5}, \frac{10}{3}$

**Solution**

Figure 1P.6.1

34.  $\frac{1}{4}, \frac{9}{5}, \frac{11}{3}$

35.  $\frac{3}{10}, \frac{7}{2}, \frac{11}{6}, 4$

**Solution**

Figure 1P.6.2

36.  $\frac{7}{10}, \frac{5}{2}, \frac{13}{8}, 3$

37.  $\frac{2}{5}, -\frac{2}{5}$

**Solution**

Figure 1P.6.3

38.  $\frac{3}{4}, -\frac{3}{4}$

39.  $\frac{3}{4}, -\frac{3}{4}, 1\frac{2}{3}, -1\frac{2}{3}, \frac{5}{2}, -\frac{5}{2}$

**Solution**

Figure 1P.6.4

40.  $\frac{2}{5}, -\frac{2}{5}, 1\frac{3}{4}, -1\frac{3}{4}, \frac{8}{3}, -\frac{8}{3}$

## Exercises: Order Pairs of Numbers

Instructions: For questions 41-48, order each of the pairs of numbers, using < or >.

41.  $-1$  \_\_\_  $-\frac{1}{4}$

**Solution**

<

---

42.  $-1$  \_\_\_  $-\frac{1}{3}$

43.  $-2\frac{1}{2}$  \_\_\_  $-3$

**Solution**

>

---

44.  $-1\frac{3}{4}$  \_\_\_  $-2$

45.  $-\frac{5}{12}$  \_\_\_  $-\frac{7}{12}$

**Solution**

>

---

46.  $-\frac{9}{10} \text{ — } -\frac{3}{10}$

---

47.  $-3 \text{ — } -\frac{13}{5}$

**Solution**

<

---

48.  $-4 \text{ — } -\frac{23}{6}$

---

## Exercises: Locate Decimals on the Number Line

Instructions: For questions 49-52, locate the number on the number line.

49. 0.8

**Solution**

Figure 1P.6.5

---

50.  $-0.9$

---

51.  $-1.6$

**Solution**

Figure 1P.6.6

52.  $3.1$

### Exercises: Order Pairs of Numbers

Instructions: For questions 53-60, order each of the pairs of numbers, using  $<$  or  $>$ .

53.  $0.37$  \_\_\_  $0.63$

**Solution**

$<$

54.  $0.86$  \_\_\_  $0.69$

55.  $0.91$  \_\_\_  $0.901$

**Solution**

$>$

56.  $0.415$  \_\_\_  $0.41$

---

57.  $-0.5$  \_\_\_  $-0.3$

**Solution**

$<$

---

58.  $-0.1$  \_\_\_  $-0.4$

---

59.  $-0.62$  \_\_\_  $-0.619$

**Solution**

$<$

---

60.  $-7.31$  \_\_\_  $-7.3$

---

## Exercises: Everyday Math

Instructions: For questions 61-62, answer the given everyday math word problems.

**61. Field Trip.** All the 5th graders at Lincoln Elementary School will go on a field trip to the science museum. Counting all the children, teachers, and chaperones, there will be 147 people. Each bus holds 44 people.

- a. How many buses will be needed?
- b. Why must the answer be a whole number?
- c. Why shouldn't you round the answer the usual way, by choosing the whole number closest to the exact answer?

**Solution**

- a. 4 buses
  - b. Answers may vary
  - c. Answers may vary
- 

**62. Child Care.** Serena wants to open a licensed child care center. Her state requires there be no more than 12 children for each teacher. She would like her child care center to serve 40 children.

- a. How many teachers will be needed?
  - b. Why must the answer be a whole number?
  - c. Why shouldn't you round the answer the usual way, by choosing the whole number closest to the exact answer?
- 

## Exercises: Writing Exercises

Instructions: For questions 63-64, answer the given writing exercises.

**63. In your own words, explain the difference between a rational number and an irrational number.**

**Solution**

Answers may vary

---

**64. Explain how the sets of numbers (counting, whole, integer, rational, irrationals, reals) are**

**related to each other.**

# EXERCISES: PROPERTIES OF REAL NUMBERS (1.7)

---

## Exercises: Use the Commutative and Associative Properties

Instructions: For questions 1–4, use the associative property to simplify.

1.  $3(4x)$

**Solution**

$$12x$$

---

2.  $4(7m)$

3.  $(y + 12) + 28$

**Solution**

$$y + 40$$

---

4.  $(n + 17) + 33$

---

## Exercises: Use the Commutative and Associative Properties

Instructions: For questions 5–26, simplify.

5.  $\frac{1}{2} + \frac{7}{8} + \left(-\frac{1}{2}\right)$

**Solution**

$$\frac{7}{8}$$

---

6.  $\frac{2}{5} + \frac{5}{12} + \left(-\frac{2}{5}\right)$

**Solution**

$$\frac{49}{12}$$

---

7.  $\frac{3}{20} \times \frac{49}{11} \times \frac{20}{3}$

**Solution**

$$\frac{49}{11}$$

---

8.  $\frac{13}{18} \times \frac{25}{7} \times \frac{18}{13}$

9.  $-24.7 \times \frac{3}{8}$

---

**Solution** $-63$ 

---

$$10. -36 \times 11 \times \frac{4}{9}$$

---

$$11. \left( \frac{5}{6} + \frac{8}{15} \right) + \frac{7}{15}$$

**Solution**

$$1\frac{5}{6}$$

---

$$12. \left( \frac{11}{12} + \frac{4}{9} \right) + \frac{5}{9}$$

---

$$13. 17(0.25)(4)$$

**Solution** $17$ 

---

$$14. 36(0.2)(5)$$

---

$$15. [2.48(12)] (0.5)$$

**Solution**

14.88

---

16.  $[9.731(4)](0.75)$

---

17.  $7(4a)$

**Solution**

$28a$

---

18.  $9(8w)$

---

19.  $-15(5m)$

**Solution**

$-75m$

---

20.  $-23(2n)$

---

21.  $12\left(\frac{5}{6}p\right)$

**Solution**

$10p$

---

$$22. 20 \left( \frac{3}{5}q \right)$$

---

$$23. 43m + (-12n) + (-16m) + (-9n)$$

**Solution**

$$27m + (-21n)$$

---

$$24. -22p + 17q + (-35p) + (-27q)$$

---

$$25. \frac{3}{8}g + \frac{1}{12}h + \frac{7}{8}g + \frac{5}{12}h$$

**Solution**

$$\frac{5}{4}g + \frac{1}{2}h$$

---

$$26. \frac{5}{6}a + \frac{3}{10}b + \frac{1}{6}a + \frac{9}{10}b$$

---

$$27. 6.8p + 9.14q + (-4.37p) + (-0.88q)$$

**Solution**

$$2.43p + 8.26q$$

---

$$28. 9.6m + 7.22n + (-2.19m) + (-0.65n)$$

---

## Exercises: Use the Identity and Inverse Properties of Addition and Multiplication

Instructions: For questions 29–32, find the additive inverse of each number.

29.

a.  $\frac{2}{5}$

b. 4.3

c.  $-8$

d.  $-\frac{10}{3}$

**Solution**

a.  $-\frac{2}{5}$

b.  $-4.3$

c. 8

d.  $\frac{10}{3}$

---

30.

a.  $\frac{5}{9}$

b. 2.1

c.  $-3$

d.  $-\frac{9}{5}$

---

31.

- a.  $-\frac{7}{6}$   
b.  $-0.075$   
c.  $23$   
d.  $\frac{1}{4}$

**Solution**

- a.  $\frac{7}{6}$   
b.  $0.075$   
c.  $-23$   
d.  $-\frac{1}{4}$
- 

32.

- a.  $-\frac{8}{3}$   
b.  $-0.019$   
c.  $52$   
d.  $\frac{5}{6}$
- 

### Exercises: Use the Identity and Inverse Properties of Addition and Multiplication

Instructions: For questions 33–36, find the multiplicative inverse of each number.

33.

- a.  $6$

b.  $-\frac{3}{4}$

c. 0.7

**Solution**

a.  $\frac{1}{6}$

b.  $-\frac{4}{3}$

c.  $\frac{10}{7}$

**34.**

a. 12

b.  $-\frac{9}{2}$

c. 0.13

**35.**

a.  $\frac{11}{12}$

b.  $-1.1$

c.  $-4$

**Solution**

a.  $\frac{12}{11}$

b.  $-\frac{10}{11}$

c.  $-\frac{1}{4}$

**36.**

- a.  $\frac{17}{20}$   
b.  $-1.5$   
c.  $-3$
- 

## Exercises: Use the Properties of Zero

Instructions: For questions 37–44, simplify.

37.  $\frac{0}{6}$

**Solution**

0

---

38.  $\frac{3}{0}$

---

39.  $0 \div \frac{11}{12}$

**Solution**

0

---

40.  $\frac{6}{0}$

---

41.  $\frac{0}{3}$

**Solution**

0

---

42.  $0 \times \frac{8}{15}$

**Solution**

0

---

44.  $\frac{\frac{1}{10}}{0}$

## Exercises: Mixed Practice

Instructions: For questions 45–58, simplify.

45.  $19a + 44 - 19a$

**Solution**

44

---

46.  $27c + 16 - 27c$

---

47.  $10(0.1d)$

**Solution**

$d$

---

48.  $100(0.01p)$

---

49.  $\frac{0}{u - 4.99}$ , where  $u \neq 4.99$

**Solution**

0

---

50.  $\frac{0}{v - 65.1}$ , where  $v \neq 65.1$

---

51.  $0 \div \left(x - \frac{1}{2}\right)$ , where  $x \neq \frac{1}{2}$

**Solution**

0

---

52.  $0 \div \left(y - \frac{1}{6}\right)$ , where  $x \neq \frac{1}{6}$

---

53.  $\frac{32 - 5a}{0}$ , where  $32 - 5a \neq 0$

**Solution**

undefined

---

54.  $\frac{28 - 9b}{0}$ , where  $28 - 9b \neq 0$

**Solution**

undefined

---

55.  $\left(\frac{3}{4} + \frac{9}{10}m\right) \div 0$  where  $\frac{3}{4} + \frac{9}{10}m \neq 0$

**Solution**

undefined

---

56.  $\left(\frac{5}{16}n - \frac{3}{7}\right) \div 0$  where  $\frac{5}{16}n - \frac{3}{7} \neq 0$

57.  $15 \times \frac{3}{5}(4d + 10)$

**Solution**

$36d + 90$

---

58.  $18 \times \frac{5}{6}(15h + 24)$

---

## Exercises: Simplify Expressions Using the Distributive Property

Instructions: For questions 59–94, simplify using the distributive property.

59.  $8(4y + 9)$

**Solution**

$$32y + 72$$

---

60.  $9(3w + 7)$

---

61.  $6(c - 13)$

**Solution**

$$6c - 78$$

---

62.  $7(y - 13)$

---

63.  $\frac{1}{4}(3q + 12)$

**Solution**

$$\frac{3}{4}q + 3$$

---

64.  $\frac{1}{5}(4m + 20)$

---

65.  $9\left(\frac{5}{9}y - \frac{1}{3}\right)$

**Solution**

$5y - 3$

---

66.  $10\left(\frac{3}{10}x - \frac{2}{5}\right)$

---

67.  $12\left(\frac{1}{4} + \frac{2}{3}r\right)$

**Solution**

$3 + 8r$

---

68.  $12\left(\frac{1}{6} + \frac{3}{4}s\right)$

---

69.  $r(s - 18)$

**Solution**

$rs - 18r$

---

70.  $u(v - 10)$

---

71.  $(y + 4)p$

**Solution**

$yp + 4p$

---

72.  $(a + 7)x$

---

73.  $-7(4p + 1)$

**Solution**

$-28p - 7$

---

74.  $-9(9a + 4)$

---

75.  $-3(x - 6)$

**Solution**

$-3x + 18$

---

76.  $-4(q - 7)$

---

77.  $-(3x - 7)$

**Solution**

$-3x + 7$ 

---

78.  $-(5p - 4)$ 

---

79.  $16 - 3(y + 8)$

**Solution**

$-3y - 8$ 

---

80.  $18 - 4(x + 2)$ 

---

81.  $4 - 11(3c - 2)$

**Solution**

$-33c + 26$ 

---

82.  $9 - 6(7n - 5)$ 

---

83.  $22 - (a + 3)$

**Solution**

$-a + 19$ 

---

84.  $8 - (r - 7)$

---

85.  $(5m - 3) - (m + 7)$

**Solution**

$4m - 10$

---

86.  $(4y - 1) - (y - 2)$

---

87.  $5(2n + 9) + 12(n - 3)$

**Solution**

$22n + 9$

---

88.  $9(5u + 8) + 2(u - 6)$

---

89.  $9(8x - 3) - (-2)$

**Solution**

$72x - 25$

---

90.  $4(6x - 1) - (-8)$

---

91.  $14(c - 1) - 8(c - 6)$

**Solution**

$$6c + 34$$

---

92.  $11(n - 7) - 5(n - 1)$

---

93.  $6(7y + 8) - (30y - 15)$

**Solution**

$$12y + 63$$

---

94.  $7(3n + 9) - (4n - 13)$

## Exercises: Everyday Math

Instructions: For questions 95–98, answer the given everyday math word problems.

**95. Insurance co-payment.** Carrie had to have 5 fillings done. Each filling cost \$80. Her dental insurance required her to pay 20% of the cost as a copay. Calculate Carrie's copay:

- First, by multiplying 0.20 by 80 to find her copay for each filling and then multiplying your answer by 5 to find her total copay for 5 fillings.
- Next, by multiplying  $[5(0.20)] (80)$
- Which of the properties of real numbers says that your answers to parts (a), where you multiplied  $5 [(0.20)(80)]$  and (b), where you multiplied  $[5(0.20)] (80)$ , should be equal?

**Solution**

- a. \$80
  - b. \$80
  - c. Answers will vary
- 

**96. Cooking time.** Helen bought a 24-pound turkey for her family's Thanksgiving dinner and wants to know what time to put the turkey in to the oven. She wants to allow 20 minutes per pound cooking time. Calculate the length of time needed to roast the turkey:

- a. First, by multiplying  $24 \times 20$  to find the total number of minutes and then multiplying the answer by  $\frac{1}{60}$  to convert minutes into hours.
  - b. Next, by multiplying  $24 \left( 20 \times \frac{1}{60} \right)$ .
  - c. Which of the properties of real numbers says that your answers to parts (a), where you multiplied  $(24 \times 20) \frac{1}{60}$ , and (b), where you multiplied  $24 \left( 20 \times \frac{1}{60} \right)$ , should be equal?
- 

**97. Buying by the case.** Trader Joe's grocery stores sold a bottle of wine they called "Two Buck Chuck" for \$1.99. They sold a case of 12 bottles for \$23.88. To find the cost of 12 bottles at \$1.99, notice that 1.99 is  $2 - 0.01$ .

- a. Multiply  $12(1.99)$  by using the distributive property to multiply  $12(2 - 0.01)$ .
- b. Was it a bargain to buy "Two Buck Chuck" by the case?

**Solution**

- a. \$23.88
  - b. no, the price is the same
- 

**98. Multi-pack purchase.** Adele's shampoo sells for \$3.99 per bottle at the grocery store. At the warehouse store, the same shampoo is sold as a 3 pack for \$10.49. To find the cost of 3 bottles at \$3.99, notice that 3.99 is  $4 - 0.01$ .

- a. Multiply  $3(3.99)$  by using the distributive property to multiply  $3(4 - 0.01)$ .

**b. How much would Adele save by buying 3 bottles at the warehouse store instead of at the grocery store?**

---

## Exercises: Writing Exercises

Instructions: For questions 99–102, answer the given writing exercises.

**99. In your own words, state the commutative property of addition.**

**Solution**

Answers may vary

---

**100. What is the difference between the additive inverse and the multiplicative inverse of a number?**

---

**101. Simplify  $8 \left( x - \frac{1}{4} \right)$  using the distributive property and explain each step.**

**Solution**

Answers may vary

---

**102. Explain how you can multiply  $4(\$5.97)$  without paper or calculator by thinking of  $\$5.97$  as  $6 - 0.03$  and then using the distributive property.**

---

# EXERCISES: SYSTEMS OF MEASUREMENT (2.1)

---

## Exercises: Make Unit Conversions in the Metric System

Instructions: For questions 1–15, convert the units.

**1. Convert each of the following measurements:**

- a.  $439 \text{ mm} = (?) \text{ m}$
  - b.  $48.3 \text{ mm} = (?) \text{ m}$
  - c.  $7230 \text{ mL} = (?) \text{ kL}$
  - d.  $52 \text{ cm} = (?) \text{ mm}$
- 

**2. Ghalib ran 5 kilometres. Convert the length to meters.**

**Solution**

5,000 meters

---

**3. Kitaka hiked 8 kilometres. Convert the length to meters.**

---

**4. Estrella is 1.55 meters tall. Convert her height to centimetres.**

**Solution**

155 centimetres

---

**5. The width of the wading pool is 2.45 meters. Convert the width to centimetres.**

---

**6. Mount Whitney is 3,072 meters tall. Convert the height to kilometres.**

**Solution**

3.072 kilometres

---

**7. The depth of the Mariana Trench is 10,911 meters. Convert the depth to kilometres.**

---

**8. June's multivitamin contains 1,500 milligrams of calcium. Convert this to grams.**

**Solution**

1.5 grams

---

**9. A typical ruby-throated hummingbird weighs 3 grams. Convert this to milligrams.**

---

**10. One stick of butter contains 91.6 grams of fat. Convert this to milligrams.**

**Solution**

91,600 milligrams

---

**11. One serving of gourmet ice cream has 25 grams of fat. Convert this to milligrams.**

---

**12. The maximum mass of an airmail letter is 2 kilograms. Convert this to grams.**

**Solution**

2,000 grams

---

**13. Dimitri's daughter weighed 3.8 kilograms at birth. Convert this to grams.**

---

**14. A bottle of wine contained 750 millilitres. Convert this to litres.**

**Solution**

0.75 litres

---

**15. A bottle of medicine contained 300 millilitres. Convert this to litres.**

---

## Exercises: Use Mixed Units of Measurement in the Metric System

Instructions: For questions 16–25, solve.

**16. Matthias is 1.8 metres tall. His son is 89 centimetres tall. How much taller is Matthias than his son?**

**Solution**

91 centimetres

---

**17. Stavros is 1.6 metres tall. His sister is 95 centimetres tall. How much taller is Stavros than his sister?**

---

**18. A typical dove weighs 345 grams. A typical duck weighs 1.2 kilograms. What is the difference, in grams, of the weights of a duck and a dove?**

**Solution**

855 grams

---

**19. Concetta had a 2-kilogram bag of flour. She used 180 grams of flour to make biscotti. How many kilograms of flour are left in the bag?**

---

**20. Harry mailed 5 packages that weighed 420 grams each. What was the total weight of the packages in kilograms?**

**Solution**

2.1 kilograms

---

**21. One glass of orange juice provides 560 milligrams of potassium. Linda drinks one glass of orange juice every morning. How many grams of potassium does Linda get from her orange juice in 30 days?**

---

**22. Jonas drinks 200 millilitres of water 8 times a day. How many litres of water does Jonas drink in a day?**

**Solution**

1.6 litres

---

23. One serving of whole grain sandwich bread provides 6 grams of protein. How many milligrams of protein are provided by 7 servings of whole grain sandwich bread?

---

24. Combine:

a.  $7\text{ m} - 3000\text{ mm} = (?)\text{ mm}$

b.  $63\text{ kg} + 6\text{ g} = (?)\text{ g}$

**Solution**

a. 4,000 mm

b. 63,006 g

---

25. Complete:

a.  $38\text{ cm}^3 = (?)\text{ g}$

b.  $5\text{ L} = (?)\text{ cm}^3$

c. 18 L of water has a volume of \_\_\_\_  $\text{cm}^3$ .

d. A water tank measures 45 cm by 35 cm by 25 cm. How many kilolitres of water will it hold?

---

## Exercises: Make Unit Conversions in the U.S. System

Instructions: For questions 26–51, convert the units.

26. A park bench is 6 feet long. Convert the length to inches.

**Solution**

72 inches

---

**27. A floor tile is 2 feet wide. Convert the width to inches.**

---

**28. A ribbon is 18 inches long. Convert the length to feet.**

**Solution**

1.5 feet

---

**29. Carson is 45 inches tall. Convert his height to feet.**

---

**30. A football field is 160 feet wide. Convert the width to yards.**

**Solution**

$53\frac{1}{3}$  yards

---

**31. On a baseball diamond, the distance from home plate to first base is 30 yards. Convert the distance to feet.**

---

**32. Ulises lives 1.5 miles from school. Convert the distance to feet.**

**Solution**

7,920 feet

---

**33. Denver, Colorado, is 5,183 feet above sea level. Convert the height to miles.**

---

**34. A killer whale weighs 4.6 tons. Convert the weight to pounds.**

**Solution**

9,200 pounds

---

**35. Blue whales can weigh as much as 150 tons. Convert the weight to pounds.**

---

**36. An empty bus weighs 35,000 pounds. Convert the weight to tons.**

**Solution**

$17\frac{1}{2}$  tons

---

**37. At take-off, an airplane weighs 220,000 pounds. Convert the weight to tons.**

---

**38. Rocco waited  $1\frac{1}{2}$  hours for his appointment. Convert the time to seconds.**

**Solution**

5,400 s

---

**39. Misty's surgery lasted  $2\frac{1}{4}$  hours. Convert the time to seconds.**

---

**40. How many teaspoons are in a pint?**

**Solution**

96 teaspoons

---

**41. How many tablespoons are in a gallon?**

---

**42. JJ's cat, Posy, weighs 14 pounds. Convert her weight to ounces.**

**Solution**

224 ounces

---

**43. April's dog, Beans, weighs 8 pounds. Convert his weight to ounces.**

---

**44. Crista will serve 20 cups of juice at her son's party. Convert the volume to gallons.**

**Solution**

$1\frac{1}{4}$  gallons

---

**45. Lance needs 50 cups of water for the runners in a race. Convert the volume to gallons.**

---

**46. Jon is 6 feet 4 inches tall. Convert his height to inches.**

**Solution**

26 in.

---

47. Faye is 4 feet 10 inches tall. Convert her height to inches.

---

48. The voyage of the *Mayflower* took 2 months and 5 days. Convert the time to days.

**Solution**

65 days

---

49. Lynn's cruise lasted 6 days and 18 hours. Convert the time to hours.

---

50. Baby Preston weighed 7 pounds 3 ounces at birth. Convert his weight to ounces.

**Solution**

115 ounces

---

51. Baby Audrey weighed 6 pounds 15 ounces at birth. Convert her weight to ounces.

---

## Exercises: Use Mixed Units of Measurement in the U.S. System

Instructions: For questions 52–59, solve.

52. Eli caught three fish. The weights of the fish were 2 pounds 4 ounces, 1 pound 11 ounces, and 4 pounds 14 ounces. What was the total weight of the three fish?

**Solution**

8 lbs. 13 oz.

---

**53. Judy bought 1 pound 6 ounces of almonds, 2 pounds 3 ounces of walnuts, and 8 ounces of cashews. How many pounds of nuts did Judy buy?**

---

**54. One day Anya kept track of the number of minutes she spent driving. She recorded 45, 10, 8, 65, 20, and 35. How many hours did Anya spend driving?**

**Solution**

3.05 hours

---

**55. Last year Eric went on 6 business trips. The number of days of each was 5, 2, 8, 12, 6, and 3. How many weeks did Eric spend on business trips last year?**

---

**56. Renee attached a 6 feet 6 inch extension cord to her computer's 3 feet 8 inch power cord. What was the total length of the cords?**

**Solution**

10 ft. 2 in.

---

**57. Fawzi's SUV is 6 feet 4 inches tall. If he puts a 2 feet 10 inch box on top of his SUV, what is the total height of the SUV and the box?**

---

**58. Leilani wants to make 8 placemats. For each placemat she needs 18 inches of fabric. How many yards of fabric will she need for the 8 placemats?**

**Solution**

4 yards

---

**59. Mireille needs to cut 24 inches of ribbon for each of the 12 girls in her dance class. How many yards of ribbon will she need altogether?**

---

## Exercises: Convert Between the U.S. and the Metric Systems of Measurement

Instructions: For questions 60–71, make the unit conversions. Round to the nearest tenth.

**60. Bill is 75 inches tall. Convert his height to centimetres.**

**Solution**

190.5 centimetres

---

**61. Frankie is 42 inches tall. Convert his height to centimetres.**

---

**62. Marcus passed a football 24 yards. Convert the pass length to metres**

**Solution**

21.9 meters

---

**63. Connie bought 9 yards of fabric to make drapes. Convert the fabric length to metres.**

---

**64. Each American throws out an average of 1,650 pounds of garbage per year. Convert this weight to kilograms.**

**Solution**

742.5 kilograms

---

**65. An average American will throw away 90,000 pounds of trash over his or her lifetime. Convert this weight to kilograms.**

---

**66. A 5K run is 5 kilometres long. Convert this length to miles.**

**Solution**

3.1 miles

---

**67. Kathryn is 1.6 metres tall. Convert her height to feet.**

---

**68. Dawn's suitcase weighed 20 kilograms. Convert the weight to pounds.**

**Solution**

44 pounds

---

**69. Jackson's backpack weighed 15 kilograms. Convert the weight to pounds.**

---

**70. Ozzie put 14 gallons of gas in his truck. Convert the volume to litres.**

**Solution**

53.2 litres

---

71. Bernard bought 8 gallons of paint. Convert the volume to litres.

---

## Exercises: Convert between Fahrenheit and Celsius Temperatures

Instructions: For questions 72–79, convert the Fahrenheit temperatures to degrees Celsius.  
Round to the nearest tenth.

72.  $86^{\circ}$  Fahrenheit

**Solution**

$30^{\circ}\text{C}$

---

73.  $77^{\circ}$  Fahrenheit

---

74.  $104^{\circ}$  Fahrenheit

**Solution**

$40^{\circ}\text{C}$

---

75.  $14^{\circ}$  Fahrenheit

---

**76.  $72^{\circ}$  Fahrenheit**

**Solution**

$22.2^{\circ}\text{C}$

---

**77.  $4^{\circ}$  Fahrenheit**

---

**78.  $0^{\circ}$  Fahrenheit**

**Solution**

$-17.8^{\circ}\text{C}$

---

**79.  $120^{\circ}$  Fahrenheit**

---

## Exercises: Convert between Fahrenheit and Celsius Temperatures

Instructions: For questions 80–87, convert the Celsius temperatures to degrees Fahrenheit. Round to the nearest tenth.

**80.  $5^{\circ}$  Celsius**

**Solution**

$41^{\circ}\text{F}$

---

**81.  $25^{\circ}$  Celsius**

---

**82.  $-10^{\circ}$  Celsius**

**Solution**

$14^{\circ}\text{F}$

---

**83.  $-15^{\circ}$  Celsius**

---

**84.  $22^{\circ}$  Celsius**

**Solution**

$71.6^{\circ}\text{F}$

---

**85.  $8^{\circ}$  Celsius**

---

**86.  $43^{\circ}$  Celsius**

**Solution**

$109.4^{\circ}\text{F}$

---

**87.  $16^{\circ}$  Celsius**

---

## Exercises: Everyday Math

Instructions: For questions 88–89, answer the given everyday math word problem.

**88. Nutrition.** Julian drinks one can of soda every day. Each can of soda contains 40 grams of sugar. How many kilograms of sugar does Julian get from soda in 1 year?

**Solution**

14.6 kilograms

---

**89. Reflectors.** The reflectors in each lane-marking stripe on a highway are spaced 16 yards apart. How many reflectors are needed for a one mile long lane-marking stripe?

---

## Exercises: Writing Exercises

Instructions: For questions 90–91, answer the given writing exercises.

**90. Some people think that  $65^{\circ}$  to  $75^{\circ}$  Fahrenheit is the ideal temperature range.**

**a. What is your ideal temperature range? Why do you think so?**

**b. Convert your ideal temperatures from Fahrenheit to Celsius.**

**Solution**

Answers may vary.

---

**91. Read the prompts and answer accordingly.**

- a. Did you grow up using the U.S. or the metric system of measurement?**
  - b. Describe two examples in your life when you had to convert between the two systems of measurement.**
-

# EXERCISES: ACCURACY, PRECISION, AND ROUNDING RULES (2.2)

---

## Exercises: Significant Figures and Proper Units

Instructions: For questions 1–18, express your answer to problems in this section to the correct number of significant figures and proper units.

**1. Suppose that your bathroom scale reads your mass as 65 kg with a 3% uncertainty. What is the uncertainty in your mass (in kilograms)?**

**Solution**

2 kg

---

**2. A good-quality measuring tape can be off by 0.50 cm over a distance of 20 m. What is its percent uncertainty?**

---

**3. A car speedometer has a 5.0% uncertainty.**

**a. What is the range of possible speeds when it reads 90 km/h?**

**b. Convert this range to miles per hour.**

**Solution**

(1 km = 0.6214 mi)

a. 85.5 to 94.5 km/h

b. 53.1 to 58.7 mi/h

---

4. An infant's pulse rate is measured to be  $130 \pm 5$  beats/min. What is the percent uncertainty in this measurement?

---

5. Suppose that a person has an average heart rate of 72.0 beats/min.

a. How many beats does he or she have in 2.0 y?

b. In 2.00 y?

c. In 2.000 y?

**Solution**

a.  $7.6 \times 10^6$  beats

b.  $7.57 \times 10^7$  beats

c.  $7.57 \times 10^7$  beats

---

6. A can contains 375 mL of soda. How much is left after 308 mL is removed?

---

7. State how many significant figures are proper in the results of the following calculations:

a.  $(106.7)(98.2)/(46.210)(1.01)$

b.  $(18.7)^2$

c.  $(1.60 \times 10^{-19})(3712)$

**Solution**

a. 3

b. 3

c. 3

---

8.

a. How many significant figures are in the numbers 99 and 100?

b. If the uncertainty in each number is 1, what is the percent uncertainty in each?

c. Which is a more meaningful way to express the accuracy of these two numbers, significant figures or percent uncertainties?

---

9.

a. If your speedometer has an uncertainty of 2.0 km/h at a speed of 90 km/h, what is the percent uncertainty?

b. If it has the same percent uncertainty when it reads 60 km/h, what is the range of speeds you could be going?

**Solution**

a. 2.2%

b. 59 to 61 km/h

---

10.

a. A person's blood pressure is measured to be  $120 \pm 2$  mm Hg. What is its percent uncertainty?

b. Assuming the same percent uncertainty, what is the uncertainty in a blood pressure measurement of 80 mm Hg?

---

11. A person measures his or her heart rate by counting the number of beats in 30 s. If  $40 \pm 1$  beats are counted in  $30.0 \pm 0.5$  s, what is the heart rate and its uncertainty in beats per minute?

**Solution**

$80 \pm 3$  beats/min

---

12. What is the area of a circle 3.102 cm in diameter?

---

13. If a marathon runner averages 9.5 mi/h, how long does it take him or her to run a 26.22-mi marathon?

**Solution**

2.8 h

---

14. A marathon runner completes a 42.188-km course in 2 h, 30 min, and 12 s. There is an uncertainty of 25 m in the distance travelled and an uncertainty of 1 s in the elapsed time.

- Calculate the percent uncertainty in the distance.
  - Calculate the uncertainty in the elapsed time.
  - What is the average speed in meters per second?
  - What is the uncertainty in the average speed?
- 

15. The sides of a small rectangular box are measured to be  $1.80 \pm 0.01$  cm,  $2.05 \pm 0.02$  cm, and  $3.1 \pm 0.1$  cm long. Calculate its volume and uncertainty in cubic centimetres.

**Solution**

$11.4 \pm 0.5$  cm<sup>3</sup>

---

16. When non-metric units were used in the United Kingdom, a unit of mass called the *pound-mass* (lbm) was employed, where 1 lbm = 0.4539 kg.

- If there is an uncertainty of 0.0001 kg in the pound-mass unit, what is its percent uncertainty?
  - Based on that percent uncertainty, what mass in pound-mass has an uncertainty of 1 kg when converted to kilograms?
- 

17. The length and width of a rectangular room are measured to be  $3.955 \pm 0.005$  m and  $3.050 \pm 0.005$  m. Calculate the area of the room and its uncertainty in square meters.

**Solution**

$$12.06 \pm 0.04 \text{ m}^2$$

---

18. A car engine moves a piston with a circular cross section of  $7.500 \pm 0.002 \text{ cm}$  diameter a distance of  $3.250 \pm 0.001 \text{ cm}$  to compress the gas in the cylinder.

- By what amount is the gas decreased in volume in cubic centimetres?
  - Find the uncertainty in this volume.
- 

## Exercises: Significant Figures

Instructions: For questions 19–34, express each measurement to the correct number of significant figures.

19. Express each measurement to the correct number of significant figures.

a.

**Figure 2P.2.1.** Pressure gauge in units of pounds per square inch

b.

**Figure 2P.2.2.** A measuring ruler

**Solution**

a. 375 psi

b. 1.30 cm

---

20. Express each measurement to the correct number of significant figures.

a.

**Figure 2P.2.3.** Pressure gauge in units of pounds per square inch

b.

**Figure 2P.2.4.** A measuring ruler

---

**21. How many significant figures do these numbers have?**

- a. 23
- b. 23.0
- c. 0.00023
- d. 0.0002302

**Solution**

- a. Two
- b. Three
- c. Two
- d. Four

---

**22. How many significant figures do these numbers have?**

- a.  $5.44 \times 10^8$
- b.  $1.008 \times 10^{-5}$
- c. 43.09
- d. 0.0000001381

---

**23. How many significant figures do these numbers have?**

- a. 765,890
- b. 765,890.0
- c.  $1.2000 \times 10^5$
- d. 0.0005060

**Solution**

- a. Five
  - b. Seven
  - c. Five
  - d. Four
- 

**24. How many significant figures do these numbers have?**

- a. 0.009
  - b. 0.0000009
  - c. 65,444
  - d. 65,040
- 

**25. Compute and express each answer with the proper number of significant figures, rounding as necessary.**

- a.  $56.0 + 3.44 = ?$
- b.  $0.00665 + 1.004 = ?$
- c.  $45.99 - 32.8 = ?$
- d.  $45.99 - 32.8 + 75.02 = ?$

**Solution**

- a. 59.4
  - b. 1.011
  - c. 13.2
  - d. 88.2
- 

**26. Compute and express each answer with the proper number of significant figures, rounding as necessary.**

- a.  $1.005 + 17.88 = ?$
  - b.  $56,700 - 324 = ?$
  - c.  $405,007 - 123.3 = ?$
  - d.  $55.5 + 66.66 - 77.777 = ?$
- 

**27. Compute and express each answer with the proper number of significant figures, rounding as necessary.**

- a.  $56.7 \times 66.99 = ?$
- b.  $1.000/77 = ?$
- c.  $1.000/77.0 = ?$
- d.  $6.022 \times 1.89 = ?$

**Solution**

- a.  $3.80 \times 10^3$
  - b. 0.013
  - c. 0.0130
  - d. 11.4
- 

**28. Compute and express each answer with the proper number of significant figures, rounding as necessary.**

- a.  $0.000440 \times 17.22 = ?$
  - b.  $203,000/0.044 = ?$
  - c.  $67 \times 85.0 \times 0.0028 = ?$
  - d.  $999,999/3,310 = ?$
- 

**29. Write the number 87,449 in scientific notation with four significant figures.**

**Solution**

$$8.745 \times 10^4$$

---

30. Write the number 306,000,000 in scientific notation to the proper number of significant figures.

---

31. Write the number 0.000066600 in scientific notation with five significant figures.

**Solution**

$$6.6600 \times 10^{-5}$$

---

32. Write the number 0.0000558 in scientific notation with two significant figures.

---

33. Perform each calculation and limit each answer to three significant figures.

a.  $67,883 \times 0.004321 = ?$

b.  $(9.67 \times 10^3) \times 0.0055087 = ?$

**Solution**

a. 293

b. 53.3

---

34. Perform each calculation and limit each answer to four significant figures.

a.  $18,900 \times 76.33 / 0.00336 = ?$

b.  $0.77604 / 76,003 \times 8.888 = ?$

---

# EXERCISES: SCIENTIFIC NOTATION (2.3)

---

## Exercises: Convert from Decimal Notation to Scientific Notation

Instructions: For questions 1–8, write each number in scientific notation.

1. 57,000

---

2. 340,000

**Solution**

$3.4 \times 10^5$

---

3. 8,750,000

---

4. 1,290,000

**Solution**

$1.29 \times 10^6$

---

5. 0.026

---

6. 0.041

**Solution**

$$4.1 \times 10^{-2}$$

---

7. 0.00000871

---

8. 0.00000103

**Solution**

$$1.03 \times 10^{-6}$$

---

### Exercises: Convert Scientific Notation to Decimal Form

Instructions: For questions 9–16, convert each number to decimal form.

9.  $5.2 \times 10^2$

---

10.  $8.3 \times 10^2$

**Solution**

830

---

11.  $7.5 \times 10^6$

---

12.  $1.6 \times 10^{10}$

**Solution**

16,000,000,000

13.  $2.5 \times 10^{-2}$

14.  $3.8 \times 10^{-2}$

**Solution**

0.038

15.  $4.13 \times 10^{-5}$

16.  $1.93 \times 10^{-5}$

**Solution**

0.0000193

### Exercises: Multiply and Divide Using Scientific Notation

Instructions: For questions 17–20, multiply. Write your answer in decimal form.

17.  $(3 \times 10^{-5})(3 \times 10^9)$

18.  $(2 \times 10^2) (1 \times 10^{-4})$

**Solution**

0.02

---

19.  $(7.1 \times 10^{-2}) (2.4 \times 10^{-4})$

---

20.  $(3.5 \times 10^{-4}) (1.6 \times 10^{-2})$

**Solution**

$5.6 \times 10^{-6}$

---

### Exercises: Multiply and Divide Using Scientific Notation

Instructions: For questions 21–24, divide. Write your answer in decimal form.

21.  $\frac{7 \times 10^{-3}}{1 \times 10^{-7}}$

---

22.  $\frac{5 \times 10^{-2}}{1 \times 10^{-10}}$

**Solution**

500,000,000

---

23.  $\frac{6 \times 10^4}{3 \times 10^{-2}}$

---

24.  $\frac{8 \times 10^6}{4 \times 10^{-1}}$

**Solution**

20,000,000

---

## Exercises: Everyday Math

Instructions: For questions 25–36, answer the given everyday math word problem.

**25. The population of the United States on July 4, 2010 was almost 310,000,000. Write the number in scientific notation.**

---

**26. The population of the world on July 4, 2010 was more than 6,850,000,000. Write the number in scientific notation**

**Solution**

$6.85 \times 10^9$ .

---

**27. The average width of a human hair is 0.0018 centimetres. Write the number in scientific notation.**

---

**28. The probability of winning the 2010 Megamillions lottery was about 0.0000000057. Write the number in scientific notation.**

**Solution**

$$5.7 \times 10^{-9}$$

---

**29. In 2010, the number of Facebook users each day who changed their status to 'engaged' was  $2 \times 10^4$ . Convert this number to decimal form.**

---

**30. At the start of 2012, the US federal budget had a deficit of more than  $\$1.5 \times 10^{13}$ . Convert this number to decimal form.**

**Solution**

15,000,000,000,000

---

**31. The concentration of carbon dioxide in the atmosphere is  $3.9 \times 10^{-4}$ . Convert this number to decimal form.**

---

**32. The width of a proton is  $1 \times 10^{-5}$  of the width of an atom. Convert this number to decimal form.**

**Solution**

0.00001

---

**33. Health care costs. The Centres for Medicare and Medicaid projects that consumers will spend more than \$4 trillion on health care by 2017.**

**a. Write 4 trillion in decimal notation.**

**b. Write 4 trillion in scientific notation.**

---

**34. Coin production.** In 1942, the U.S. Mint produced 154,500,000 nickels. Write 154,500,000 in scientific notation.

**Solution**

$$1.545 \times 10^8$$

---

**35. Distance.** The distance between Earth and one of the brightest stars in the night sky is 33.7 light years. One light year is about 6,000,000,000,000 (6 trillion), miles.

- a. Write the number of miles in one light year in scientific notation.
  - b. Use scientific notation to find the distance between Earth and the star in miles. Write the answer in scientific notation.
- 

**36. Debt.** At the end of fiscal year 2015 the gross United States federal government debt was estimated to be approximately \$18,600,000,000,000 (\$18.6 trillion), according to the Federal Budget. The population of the United States was approximately 300,000,000 people at the end of fiscal year 2015.

- a. Write the debt in scientific notation.
- b. Write the population in scientific notation.
- c. Find the amount of debt per person by using scientific notation to divide the debt by the population. Write the answer in scientific notation.

**Solution**

a.  $1.86 \times 10^{13}$

b.  $3 \times 10^8$

c.  $6.2 \times 10^4$

---

## Exercises: Writing Exercises

Instructions: For question 37, answer the given writing exercise.

**37. When you convert a number from decimal notation to scientific notation, how do you know if the exponent will be positive or negative?**

**Solution**

Answers will vary

---

# EXERCISES: MORE UNIT CONVERSIONS AND ROUNDING RULES (2.4)

---

## Exercises: Significant Figures

Instructions: For questions 1–22, ensure that your answers have the appropriate number of significant figures according to our rules for precision and accuracy.

**1. Write the two conversion factors that exist between the two given units.**

- a. millilitres and litres
- b. microseconds and seconds
- c. kilometres and meters

**Solution**

- a.  $1,000 \text{ mL}/1 \text{ L}$  and  $1 \text{ L}/1,000 \text{ mL}$
  - b.  $1,000,000 \mu\text{s}/1 \text{ s}$  and  $1 \text{ s}/1,000,000 \mu\text{s}$
  - c.  $1,000 \text{ m}/1 \text{ km}$  and  $1 \text{ km}/1,000 \text{ m}$
- 

**2. Write the two conversion factors that exist between the two given units.**

- a. kilograms and grams
  - b. milliseconds and seconds
  - c. centimetres and meters
- 

**3. Perform the following conversions.**

- a. 5.4 km to meters

**b. 0.665 m to millimetres**

**c. 0.665 m to kilometres**

**Solution**

a. 5,400 m

b. 665 mm

c.  $6.65 \times 10^{-4}$  km

---

**4. Perform the following conversions.**

**a. 90.6 mL to litres**

**b. 0.00066 mL to litres**

**c. 750 L to kilolitres**

---

**5. Perform the following conversions.**

**a. 17.8  $\mu$ g to grams**

**b.  $7.22 \times 10^2$  kg to grams**

**c. 0.00118 g to nanograms**

**Solution**

a.  $1.78 \times 10^{-5}$  g

b.  $7.22 \times 10^5$  g

c.  $1.18 \times 10^6$  ng

---

**6. Perform the following conversions.**

**a. 833 ns to seconds**

**b. 5.809 s to milliseconds**

**c.  $2.77 \times 10^6$  s to megaseconds**

---

**7. Perform the following conversions.**

a.  $9.44 \text{ m}^2$  to square centimetres

b.  $3.44 \times 10^8 \text{ mm}^3$  to cubic meters

**Solution**

a.  $94,400 \text{ cm}^2$

b.  $0.344 \text{ m}^3$

---

**8. Perform the following conversions.**

a.  $0.00444 \text{ cm}^3$  to cubic meters

b.  $8.11 \times 10^2 \text{ m}^2$  to square nanometres

---

**9. Why would it be inappropriate to convert square centimetres to cubic meters?**

**Solution**

One is a unit of area, and the other is a unit of volume.

---

**10. Why would it be inappropriate to convert from cubic meters to cubic seconds?**

---

**11. Perform the following conversions.**

a.  $45.0 \text{ m/min}$  to meters/second

b.  $0.000444 \text{ m/s}$  to micrometers/second

c.  $60.0 \text{ km/h}$  to kilometres/second

**Solution**

a.  $0.75 \text{ m/s}$

b.  $444 \text{ }\mu\text{m/s}$

c.  $1.666 \times 10^{-2} \text{ km/s}$

---

**12. Perform the following conversions.**

- a.  $3.4 \times 10^2$  cm/s to centimetres/minute
  - b. 26.6 mm/s to millimetres/hour
  - c. 13.7 kg/L to kilograms/millilitres
- 

**13. Perform the following conversions.**

- a. 0.674 kL to millilitres
- b.  $2.81 \times 10^{12}$  mm to kilometres
- c. 94.5 kg to milligrams

**Solution**

- a. 674,000 mL
  - b.  $2.81 \times 10^6$  km
  - c.  $9.45 \times 10^7$  mg
- 

**14. Perform the following conversions.**

- a.  $6.79 \times 10^{-6}$  kg to micrograms
  - b. 1.22 mL to kilolitres
  - c.  $9.508 \times 10^{-9}$  ks to milliseconds
- 

**15. Perform the following conversions.**

- a.  $6.77 \times 10^{14}$  ms to kiloseconds
- b. 34,550,000 cm to kilometres

**Solution**

- a.  $6.77 \times 10^8$  ks
  - b. 345.5 km
- 

**16. Perform the following conversions.**

- a.  $4.701 \times 10^{15}$  mL to kilolitres  
 b.  $8.022 \times 10^{-11}$  ks to microseconds
- 

**17. Perform the following conversions. Note that you will have to convert units in both the numerator and the denominator.**

- a. 88 ft/s to miles/hour (Hint: use  $5,280 \text{ ft} = 1 \text{ mi.}$ )  
 b. 0.00667 km/h to meters/second

**Solution**

- a.  $6.0 \times 10^1$  mi/h  
 b. 0.00185 m/s
- 

**18. Perform the following conversions. Note that you will have to convert units in both the numerator and the denominator.**

- a.  $3.88 \times 10^2$  mm/s to kilometres/hour  
 b. 1.004 kg/L to grams/millilitre
- 

**19. What is the area in square millimetres of a rectangle whose sides are  $2.44 \text{ cm} \times 6.077 \text{ cm}$ ? Express the answer to the proper number of significant figures.**

**Solution**

$$1.48 \times 103 \text{ mm}^2$$

---

**20. What is the volume in cubic centimetres of a cube with sides of 0.774 m? Express the answer to the proper number of significant figures.**

---

**21. The formula for the area of a triangle is  $\frac{1}{2} \times \text{base} \times \text{height}$ . What is the area of a triangle in**

square centimetres if its base is 1.007 m and its height is 0.665 m? Express the answer to the proper number of significant figures.

**Solution**

$$3.35 \times 10^3 \text{ cm}^2$$

---

22. The formula for the area of a triangle is  $\frac{1}{2} \times \text{base} \times \text{height}$ . What is the area of a triangle in square meters if its base is 166 mm and its height is 930.0 mm? Express the answer to the proper number of significant figures.

---

# EXERCISES: SOLVE EQUATIONS USING THE SUBTRACTION AND ADDITION PROPERTIES OF EQUALITY (3.1)

---

## Exercises: Verify a Solution of an Equation

Instructions: For questions 1-4, determine whether the given value is a solution to the equation.

1. Is  $y = \frac{5}{3}$  a solution of  $6y + 10 = 12y$ ?

**Solution**

Yes

---

2. Is  $x = \frac{9}{4}$  a solution of  $4x + 9 = 8x$ ?

3. Is  $u = -\frac{1}{2}$  a solution of  $8u - 1 = 6u$ ?

**Solution**

No

---

4. Is  $v = -\frac{1}{3}$  a solution of  $9v - 2 = 3v$ ?

---

## Exercises: Solve Equations using the Subtraction and Addition Properties of Equality

Instructions: For questions 5-28, solve each equation using the Subtraction and Addition Properties of Equality.

5.  $x + 24 = 35$

**Solution**

$$x = 11$$

---

6.  $x + 17 = 22$

---

7.  $y + 45 = -66$

**Solution**

$$y = -111$$

---

8.  $y + 39 = -83$

---

$$9. b + \frac{1}{4} = \frac{3}{4}$$

**Solution**

$$b = \frac{1}{2}$$

---

$$10. a + \frac{2}{5} = \frac{4}{5}$$

---

$$11. p + 2.4 = -9.3$$

**Solution**

$$p = -11.7$$

---

$$12. m + 7.9 = 11.6$$

---

$$13. a - 45 = 76$$

**Solution**

$$a = 121$$

---

$$14. a - 30 = 57$$

---

$$15. m - 18 = -200$$

**Solution**

$$m = -182$$

---

$$16. m - 12 = -12$$

---

$$17. x - \frac{1}{3} = 2$$

**Solution**

$$x = \frac{7}{3}$$

---

$$18. x - \frac{1}{5} = 4$$

---

$$19. y - 3.8 = 10$$

**Solution**

$$y = 13.8$$

---

$$20. y - 7.2 = 5$$

---

$$21. x - 165 = -420$$

**Solution**

$$x = -255$$

---

$$22. z - 101 = -314$$

---

$$23. z + 0.52 = -8.5$$

**Solution**

$$z = -9.02$$

---

$$24. x + 0.93 = -4.1$$

---

$$25. q + \frac{3}{4} = \frac{1}{2}$$

**Solution**

$$q = -\frac{1}{4}$$

---

$$26. p + \frac{1}{3} = \frac{5}{6}$$

---

$$27. p - \frac{2}{5} = \frac{2}{3}$$

**Solution**

$$p = \frac{16}{15}$$

---

$$28. y - \frac{3}{4} = \frac{3}{5}$$

---

## Exercises: Solve Equations that Require Simplification

Instructions: For questions 29-50, solve each equation.

$$29. c + 31 - 10 = 46$$

**Solution**

$$c = 25$$

---

$$30. m + 16 - 28 = 5$$

---

$$31. 9x + 5 - 8x + 14 = 20$$

**Solution**

$$x = 1$$

---

$$32. 6x + 8 - 5x + 16 = 32$$

---

$$33. -6x - 11 + 7x - 5 = -16$$

**Solution**

$$x = 0$$

---

$$34. -8n - 17 + 9n - 4 = -41$$

---

$$35. 5(y - 6) - 4y = -6$$

**Solution**

$$y = 24$$

---

$$36. 9(y - 2) - 8y = -16$$

---

$$37. 8(u + 1.5) - 7u = 4.9$$

**Solution**

$$u = -7.1$$

---

$$38. 5(w + 2.2) - 4w = 9.3$$

---

$$39. 6a - 5(a - 2) + 9 = -11$$

**Solution**

$$a = -30$$

---

$$40. 8c - 7(c - 3) + 4 = -16$$

---

$$41. 6(y - 2) - 5y = 4(y + 3) - 4(y - 1)$$

**Solution**

$$y = 28$$

---

$$42. 9(x - 1) - 8x = -3(x + 5) + 3(x - 5)$$

---

$$43. 3(5n - 1) - 14n + 9 = 10(n - 4) - 6n - 4(n + 1)$$

**Solution**

$$n = -50$$

---

$$44. 2(8m + 3) - 15m - 4 = 9(m + 6) - 2(m - 1) - 7m$$

---

$$45. -(j + 2) + 2j - 1 = 5$$

**Solution**

$$j = 8$$

---

$$46. -(k + 7) + 2k + 8 = 7$$

---

$$47. -\left(\frac{1}{4}a - \frac{3}{4}\right) + \frac{5}{4}a = -2$$

**Solution**

$$a = -\frac{11}{4}$$

---

$$48. -\left(\frac{2}{3}d - \frac{1}{3}\right) + \frac{5}{3}d = -4$$

---

$$49. 8(4x + 5) - 5(6x) - x = 53 - 6(x + 1) + 3(2x + 2)$$

**Solution**

$$x = 13$$

---

$$50. 6(9y - 1) - 10(5y) - 3y = 22 - 4(2y - 12) + 8(y - 6)$$

---

## Exercises: Translate to an Equation and Solve

Instructions: For questions 51-62, translate to an equation and then solve it.

**51. Nine more than  $x$  is equal to 52.**

**Solution**

$$\begin{aligned} x + 9 &= 52 \\ x &= 43 \end{aligned}$$

---

**52. The sum of  $x$  and  $-15$  is 23.**

**53. Ten less than  $m$  is  $-14$ .**

**Solution**

$$m - 10 = -14$$

$$m = -4$$

---

**54. Three less than  $y$  is  $-19$ .**

---

**55. The sum of  $y$  and  $-30$  is  $40$ .**

**Solution**

$$y + (-30) = 40$$

$$y = 70$$

---

**56. Twelve more than  $p$  is equal to  $67$ .**

---

**57. The difference of  $9x$  and  $8x$  is  $107$ .**

**Solution**

$$9x - 8x = 107$$

$$x = 107$$

---

**58. The difference of  $5c$  and  $4c$  is  $602$ .**

---

59. The difference of  $n$  and  $\frac{1}{6}$  is  $\frac{1}{2}$ .

**Solution**

$$\begin{aligned} n - \frac{1}{6} &= \frac{1}{2} \\ n &= \frac{2}{3} \end{aligned}$$

---

60. The difference of  $f$  and  $\frac{1}{3}$  is  $\frac{1}{12}$ .

---

61. The sum of  $-4n$  and  $5n$  is  $-82$ .

**Solution**

$$\begin{aligned} -4n + 5n &= -82 \\ n &= -82 \end{aligned}$$

---

62. The sum of  $-9m$  and  $10m$  is  $-95$ .

---

## Exercises: Translate and Solve Applications

Instructions: For questions 63-72, translate into an equation and solve.

63. **Distance.** Avril rode her bike a total of 18 miles, from home to the library and then to the beach. The distance from Avril's house to the library is 7 miles. What is the distance from the library to the beach?

**Solution**

11 miles

---

**64. Reading.** Jeff read a total of 54 pages in his History and Sociology textbooks. He read 41 pages in his History textbook. How many pages did he read in his Sociology textbook?

---

**65. Age.** Eva's daughter is 15 years younger than her son. Eva's son is 22 years old. How old is her daughter?

**Solution**

7 years old

---

**66. Age.** Pablo's father is 3 years older than his mother. Pablo's mother is 42 years old. How old is his father?

---

**67. Groceries.** For a family birthday dinner, Celeste bought a turkey that weighed 5 pounds less than the one she bought for Thanksgiving. The birthday turkey weighed 16 pounds. How much did the Thanksgiving turkey weigh?

**Solution**

21 pounds

---

**68. Weight.** Allie weighs 8 pounds less than her twin sister Lorrie. Allie weighs 124 pounds. How much does Lorrie weigh?

---

**69. Health.** Connor's temperature was 0.7 degrees higher this morning than it had been last night. His temperature this morning was 101.2 degrees. What was his temperature last night?

**Solution**

100.5 degrees

---

**70. Health.** The nurse reported that Tricia's daughter had gained 4.2 pounds since her last checkup and now weighs 31.6 pounds. How much did Tricia's daughter weigh at her last checkup?

---

**71. Salary.** Ron's paycheck this week was \$17.43 less than his paycheck last week. His paycheck this week was \$103.76. How much was Ron's paycheck last week?

**Solution**

\$121.19

---

**72. Textbooks.** Melissa's math book cost \$22.85 less than her art book cost. Her math book cost \$93.75. How much did her art book cost?

## Exercises: Everyday Math

Instructions: For questions 73-74, answer the given everyday math word problems.

**73. Construction.** Miguel wants to drill a hole for a  $\frac{5}{8}$  inch screw. The hole should be  $\frac{1}{12}$  inch smaller than the screw. Let  $d$  equal the size of the hole he should drill. Solve the equation

$d - \frac{1}{12} = \frac{5}{8}$  to see what size the hole should be.

**Solution**

$$d = \frac{17}{24} \text{ inch}$$

---

74. **Baking.** Kelsey needs  $\frac{2}{3}$  cup of sugar for the cookie recipe she wants to make. She only has  $\frac{3}{8}$  cup of sugar and will borrow the rest from her neighbor. Let  $s$  equal the amount of sugar she will borrow. Solve the equation  $\frac{3}{8} + s = \frac{2}{3}$  to find the amount of sugar she should ask to borrow.

---

## Exercises: Writing Exercises

Instructions: For questions 75-76, answer the given writing exercises.

75. Is  $-8$  a solution to the equation  $3x = 16 - 5x$ ? How do you know?

**Solution**

No. Justifications will vary.

---

76. What is the first step in your solution to the equation  $10x + 2 = 4x + 26$ ?

# EXERCISES: SOLVE EQUATIONS USING THE DIVISION AND MULTIPLICATION PROPERTIES OF EQUALITY (3.2)

---

## Exercises: Solve Equations Using the Division and Multiplication Properties of Equality

Instructions: For questions 1-36, solve each equation using the Division and Multiplication Properties of Equality and check the solution.

1.  $8x = 56$

**Solution**

$$x = 7$$

---

2.  $7p = 63$

---

3.  $-5c = 55$

**Solution**

$$c = -11$$

---

4.  $-9x = -27$

---

5.  $-809 = 15y$

**Solution**

$$y = -\frac{809}{15}$$

---

6.  $-731 = 19y$

---

7.  $-37p = -541$

**Solution**

$$p = -\frac{541}{37}$$

---

8.  $-19m = -586$

---

9.  $0.25z = 3.25$

**Solution**

$$z = 13$$

---

10.  $0.75a = 11.25$

---

11.  $-13x = 0$

**Solution**

$$x = 0$$

---

12.  $24x = 0$

---

13.  $\frac{x}{4} = 35$

**Solution**

$x = 140$

---

14.  $\frac{z}{2} = 54$

---

15.  $-20 = \frac{q}{-5}$

**Solution**

$q = 100$

---

16.  $\frac{c}{-3} = -12$

---

17.  $\frac{y}{9} = -16$

**Solution**

$y = -144$

---

18.  $\frac{q}{6} = -38$

---

$$19. \frac{m}{-12} = 45$$

**Solution**

$$m = -540$$

---

$$20. -24 = \frac{p}{-20}$$

---

$$21. -y = 6$$

**Solution**

$$y = -6$$

---

$$22. -u = 15$$

---

$$23. -v = -72$$

**Solution**

$$v = 72$$

---

$$24. -x = -39$$

---

$$25. \frac{2}{3}y = 48$$

**Solution**

$$y = 72$$

---

$$26. \frac{3}{5}r = 75$$

---

$$27. -\frac{5}{8}w = 40$$

**Solution**

$$w = -64$$

---

$$28. 24 = -\frac{3}{4}x$$

---

$$29. -\frac{2}{5} = \frac{1}{10}a$$

**Solution**

$$a = -4$$

---

$$30. -\frac{1}{3}q = -\frac{5}{6}$$

---

$$31. -\frac{7}{10}x = -\frac{14}{3}$$

**Solution**

$$x = \frac{20}{3}$$

---

$$32. \frac{3}{8}y = -\frac{1}{4}$$

---

$$33. \frac{7}{12} = -\frac{3}{4}p$$

**Solution**

$$p = -\frac{7}{9}$$

---

$$34. \frac{11}{18} = -\frac{5}{6}q$$

---

$$35. -\frac{5}{18} = -\frac{10}{9}u$$

**Solution**

$$u = \frac{1}{4}$$

---

$$36. -\frac{7}{20} = -\frac{7}{4}v$$

---

## Exercises: Solve Equations that Require Simplification

Instructions: For questions 37-46, solve each equation requiring simplification.

37.  $100 - 16 = 4p - 10p - p$

**Solution**

$$p = -12$$

---

38.  $-18 - 7 = 5t - 9t - 6t$

---

39.  $\frac{7}{8}n - \frac{3}{4}n = 9 + 2$

**Solution**

$$n = 88$$

---

40.  $\frac{5}{12}q + \frac{1}{2}q = 25 - 3$

---

41.  $0.25d + 0.10d = 6 - 0.75$

**Solution**

$$d = 15$$

---

42.  $0.05p - 0.01p = 2 + 0.24$

---

43.  $-10(q - 4) - 57 = 93$

**Solution**

$q = -11$

---

44.  $-12(d - 5) - 29 = 43$

---

45.  $-10(x + 4) - 19 = 85$

**Solution**

$x = -\frac{72}{5}$

---

46.  $-15(z + 9) - 11 = 75$

---

## Exercises: Mixed Practice

Instructions: For questions 47-65, solve each equation.

47.  $\frac{9}{10}x = 90$

**Solution**

$$x = 100$$

---

$$48. \frac{5}{12}y = 60$$

---

$$49. y + 46 = 55$$

**Solution**

$$y = 9$$

---

$$50. x + 33 = 41$$

---

$$51. \frac{w}{-2} = 99$$

**Solution**

$$w = -198$$

---

$$52. \frac{s}{-3} = -60$$

---

$$53. 27 = 6a$$

**Solution**

$$a = \frac{9}{2}$$

---

54.  $-a = 7$

---

55.  $-x = 2$

**Solution**

$x = -2$

---

56.  $z - 16 = -59$

---

57.  $m - 41 = -14$

**Solution**

$m = 27$

---

58.  $0.04r = 52.60$

---

59.  $63.90 = 0.03p$

**Solution**

$p = 2130$

---

60.  $-15x = -120$

---

61.  $84 = -12z$

**Solution**

$$y = -7$$

---

**62.**  $19.36 = x - 0.2x$ 

---

**63.**  $c - 0.3c = 35.70$

**Solution**

$$c = 51$$

---

**64.**  $-y = -9$ 

---

**65.**  $-x = -8$

**Solution**

$$x = 8$$

---

## Exercises: Translate to an Equation and Solve

Instructions: For questions 66-85, translate to an equation and then solve.

**66.** 187 is the product of  $-17$  and  $m$ .

---

**67. 133 is the product of  $-19$  and  $n$ .**

**Solution**

$$133 = -19n$$

$$n = -7$$

---

**68.  $-184$  is the product of  $23$  and  $p$ .**

---

**69.  $-152$  is the product of  $8$  and  $q$ .**

**Solution**

$$-152 = 8q$$

$$q = -19$$

---

**70.  $u$  divided by  $7$  is equal to  $-49$ .**

---

**71.  $r$  divided by  $12$  is equal to  $-48$ .**

**Solution**

$$\frac{r}{12} = -48$$

$$r = -576$$

---

**72.  $h$  divided by  $-13$  is equal to  $-65$ .**

---

**73.  $j$  divided by  $-20$  is equal to  $-80$ .**

**Solution**

$$\frac{j}{-20} = -80$$
$$j = 1,600$$

---

**74. The quotient  $c$  and  $-19$  is  $38$ .**

---

**75. The quotient of  $b$  and  $-6$  is  $18$ .**

**Solution**

$$\frac{b}{-6} = 18$$
$$b = -108$$

---

**76. The quotient of  $h$  and  $26$  is  $-52$ .**

---

**77. The quotient  $k$  and  $22$  is  $-66$ .**

**Solution**

$$\frac{k}{22} = -66; k = -1,452$$

---

**78. Five-sixths of  $y$  is  $15$ .**

---

**79. Three-tenths of  $x$  is  $15$ .**

**Solution**

$$\begin{aligned}\frac{3}{10}x &= 15 \\ x &= 50\end{aligned}$$

---

**80. Four-thirds of  $w$  is 36.**

---

**81. Five-halves of  $v$  is 50.**

**Solution**

$$\begin{aligned}\frac{5}{2}v &= 50 \\ v &= 20\end{aligned}$$

---

**82. The sum of nine-tenths and  $g$  is two-thirds.**

---

**83. The sum of two-fifths and  $f$  is one-half.**

**Solution**

$$\begin{aligned}\frac{2}{5} + f &= \frac{1}{2} \\ f &= \frac{1}{10}\end{aligned}$$

---

**84. The difference of  $p$  and one-sixth is two-thirds.**

---

**85. The difference of  $q$  and one-eighth is three-fourths.**

**Solution**

$$q - \frac{1}{8} = \frac{3}{4}$$
$$q = \frac{7}{8}$$

---

## Exercises: Translate and Solve Applications

Instructions: For questions 86-93, translate into an equation and solve.

**86. Kindergarten.** Connie's kindergarten class has 24 children. She wants them to get into 4 equal groups. How many children will she put in each group?

---

**87. Balloons.** Ramona bought 18 balloons for a party. She wants to make 3 equal bunches. How many balloons did she use in each bunch?

**Solution**

6 balloons

---

**88. Tickets.** Mollie paid \$36.25 for 5 movie tickets. What was the price of each ticket?

---

**89. Shopping.** Serena paid \$12.96 for a pack of 12 pairs of sport socks. What was the price of pair of sport socks?

**Solution**

\$1.08

---

**90. Sewing.** Nancy used 14 yards of fabric to make flags for one-third of the drill team. How much fabric, would Nancy need to make flags for the whole team?

---

**91. MPG.** John's SUV gets 18 miles per gallon (mpg). This is half as many mpg as his wife's hybrid car. How many miles per gallon does the hybrid car get?

**Solution**

36 mpg

---

**92. Height.** Aiden is 27 inches tall. He is  $\frac{3}{8}$  as tall as his father. How tall is his father?

---

**93. Real estate.** Bea earned \$11,700 commission for selling a house, calculated as  $\frac{6}{100}$  of the selling price. What was the selling price of the house?

**Solution**

\$195,000

---

## Exercises: Everyday Math

Instructions: For questions 94-95, solve the given everyday math word problems.

**94. Commission.** Every week Perry gets paid \$150 plus 12% of his total sales amount. Solve the equation  $840 = 150 + 0.12(a - 1250)$  for  $a$ , to find the total amount Perry must sell in order to be paid \$840 one week.

---

**95. Stamps.** Travis bought \$9.45 worth of 49-cent stamps and 21-cent stamps. The number of 21-cent stamps was 5 less than the number of 49-cent stamps. Solve the equation  $0.49s + 0.21(s - 5) = 9.45$  for  $s$ , to find the number of 49-cent stamps Travis bought.

**Solution**

15 49-cent stamps

---

## Exercises: Writing Exercises

Instructions: For questions 96-97, answer the given writing exercises.

**96. Frida started to solve the equation  $-3x = 36$  by adding 3 to both sides. Explain why Frida's method will not solve the equation.**

---

**97. Emiliano thinks  $x = 40$  is the solution to the equation  $\frac{1}{2}x = 80$ . Explain why he is wrong.**

**Solution**

Answers will vary.

# EXERCISES: SOLVE EQUATIONS WITH VARIABLES AND CONSTANTS ON BOTH SIDES (3.3)

---

## Exercises: Solve Equations with Constants on Both Sides

Instructions: For questions 1-12, solve the following equations with constants on both sides.

1.  $9x - 3 = 60$

---

2.  $12x - 8 = 64$

**Solution**

$$x = 6$$

---

3.  $14w + 5 = 117$

---

4.  $15y + 7 = 97$

**Solution**

$$y = 6$$

---

5.  $2a + 8 = -28$

---

6.  $3m + 9 = -15$

**Solution**

$m = -8$

---

7.  $-62 = 8n - 6$

---

8.  $-77 = 9b - 5$

**Solution**

$b = -8$

---

9.  $35 = -13y + 9$

---

10.  $60 = -21x - 24$

**Solution**

$x = -4$

---

11.  $-12p - 9 = 9$

---

12.  $-14q - 2 = 16$

**Solution**

$$q = -\frac{9}{7}$$

## Exercises: Solve Equations with Variables on Both Sides

Instructions: For questions 13-24, solve the following equations with variables on both sides.

13.  $19z = 18z - 7$

---

14.  $21k = 20k - 11$

**Solution**

$$k = -11$$

---

15.  $9x + 36 = 15x$

---

16.  $8x + 27 = 11x$

**Solution**

$$x = 9$$

---

17.  $c = -3c - 20$

---

**18.**  $b = -4b - 15$

**Solution**

$$b = -3$$

---

**19.**  $9q = 44 - 2q$ 

---

**20.**  $5z = 39 - 8z$

**Solution**

$$z = 3$$

---

**21.**  $6y + \frac{1}{2} = 5y$ 

---

**22.**  $4x + \frac{3}{4} = 3x$

**Solution**

$$x = -\frac{3}{4}$$

---

**23.**  $-18a - 8 = -22a$ 

---

**24.**  $-11r - 8 = -7r$

**Solution**

$$r = -2$$

## Exercises: Solve Equations with Variables and Constants on Both Sides

Instructions: For questions 25-52, solve the equations with variables and constants on both sides.

$$25. 8x - 15 = 7x + 3$$

---

$$26. 6x - 17 = 5x + 2$$

**Solution**

$$x = 19$$

---

$$27. 26 + 13d = 14d + 11$$

---

$$28. 21 + 18f = 19f + 14$$

**Solution**

$$f = 7$$

---

$$29. 2p - 1 = 4p - 33$$

---

**30.**  $12q - 5 = 9q - 20$

**Solution**

$$q = -5$$

---

**31.**  $4a + 5 = -a - 40$ 

---

**32.**  $8c + 7 = -3c - 37$

**Solution**

$$c = -4$$

---

**33.**  $5y - 30 = -5y + 30$ 

---

**34.**  $7x - 17 = -8x + 13$

**Solution**

$$x = 2$$

---

**35.**  $7s + 12 = 5 + 4s$ 

---

**36.**  $9p + 14 = 6 + 4p$

**Solution**

$$p = -\frac{8}{5}$$

---

$$37. 2z - 6 = 23 - z$$

---

$$38. 3y - 4 = 12 - y$$

**Solution**

$$y = 4$$

---

$$39. \frac{5}{3}c - 3 = \frac{2}{3}c - 16$$

---

$$40. \frac{7}{4}m - 7 = \frac{3}{4}m - 13$$

**Solution**

$$m = -6$$

---

$$41. 8 - \frac{2}{5}q = \frac{3}{5}q + 6$$

---

$$42. 11 - \frac{1}{5}a = \frac{4}{5}a + 4$$

**Solution**

$$a = 7$$

---

$$43. \frac{4}{3}n + 9 = \frac{1}{3}n - 9$$

---

$$44. \frac{5}{4}a + 15 = \frac{3}{4}a - 5$$

**Solution**

$$a = -40$$

---

$$45. \frac{1}{4}y + 7 = \frac{3}{4}y - 3$$

---

$$46. \frac{3}{5}p + 2 = \frac{4}{5}p - 1$$

**Solution**

$$p = 15$$

---

$$47. 14n + 8.25 = 9n + 19.60$$

---

$$48. 13z + 6.45 = 8z + 23.75$$

**Solution**

$$z = 3.46$$

---

$$49. 2.4w - 100 = 0.8w + 28$$

---

$$50. 2.7w - 80 = 1.2w + 10$$

**Solution**

$$w = 60$$

---

$$51. 5.6r + 13.1 = 3.5r + 57.2$$

---

$$52. 6.6x - 18.9 = 3.4x + 54.7$$

**Solution**

$$x = 23$$

## Exercises: Everyday Math

Instructions: For questions 25-46, answer the given everyday math word problems.

**53. Concert tickets.** At a school concert the total value of tickets sold was \$1506. Student tickets sold for \$6 and adult tickets sold for 9. The number of adult tickets sold was 5 less than 3 times the number of student tickets. Find the number of student tickets sold,  $s$ , by solving the equation  $6s + 27s - 45 = 1506$ .

---

**54. Making a fence.** Jovani has 150 feet of fencing to make a rectangular garden in his backyard. He wants the length to be 15 feet more than the width. Find the width,  $w$ , by solving the equation  $150 = 2w + 30 + 2w$ .

**Solution**

30 feet

## Exercises: Writing Exercises

Instructions: For questions 55-58, answer the given writing exercises.

**55. Solve the equation  $\frac{6}{5}y - 8 = \frac{1}{5}y + 7$  explaining all the steps of your solution as in the examples in this section.**

---

**56. Solve the equation  $10x + 14 = -2x + 38$  explaining all the steps of your solution as in the examples in this section.**

**Solution**

$x = 2$  (Justifications will vary.)

---

**57. When solving an equation with variables on both sides, why is it usually better to choose the side with the larger coefficient of  $x$  to be the “variable” side?**

---

**58. Is  $x = -2$  a solution to the equation  $5 - 2x = -4x + 1$ ? How do you know?**

**Solution**

Yes. Justifications will vary.

# EXERCISES: USE A GENERAL STRATEGY TO SOLVE LINEAR EQUATIONS (3.4)

---

## Exercises: Solve Equations Using the General Strategy for Solving Linear Equations

Instructions: For questions 1-60, solve each linear equation.

1.  $15(y - 9) = -60$

---

2.  $21(y - 5) = -42$

**Solution**

$$y = 3$$

---

3.  $-9(2n + 1) = 36$

---

4.  $-16(3n + 4) = 32$

**Solution**

$$n = -2$$

---

5.  $8(22 + 11r) = 0$

---

6.  $5(8 + 6p) = 0$

**Solution**

$$p = -\frac{4}{3}$$

---

7.  $-(w - 12) = 30$

---

8.  $-(t - 19) = 28$

**Solution**

$$t = -9$$

---

9.  $9(6a + 8) + 9 = 81$

---

10.  $8(9b - 4) - 12 = 100$

**Solution**

$$b = 2$$

---

11.  $32 + 3(z + 4) = 41$

---

12.  $21 + 2(m - 4) = 25$

**Solution**

$$m = 6$$

---

13.  $51 + 5(4 - q) = 56$

---

14.  $-6 + 6(5 - k) = 15$

**Solution**

$$k = \frac{3}{2}$$

---

15.  $2(9s - 6) - 62 = 16$

---

16.  $8(6t - 5) - 35 = -27$

**Solution**

$$t = 1$$

---

17.  $3(10 - 2x) + 54 = 0$

---

18.  $-2(11 - 7x) + 54 = 4$

**Solution**

$$x = -2$$

---

$$19. \frac{2}{3}(9c - 3) = 22$$

---

$$20. \frac{3}{5}(10x - 5) = 27$$

**Solution**

$$x = 5$$

---

$$21. \frac{1}{5}(15c + 10) = c + 7$$

---

$$22. \frac{1}{4}(20d + 12) = d + 7$$

**Solution**

$$d = 1$$

---

$$23. 18 - (9r + 7) = -16$$

---

$$24. 15 - (3r + 8) = 28$$

**Solution**

$$r = -7$$

---

$$25. 5 - (n - 1) = 19$$

---

26.  $-3 - (m - 1) = 13$

**Solution**

$$m = -15$$

---

27.  $11 - 4(y - 8) = 43$

---

28.  $18 - 2(y - 3) = 32$

**Solution**

$$y = -4$$

---

29.  $24 - 8(3v + 6) = 0$

---

30.  $35 - 5(2w + 8) = -10$

**Solution**

$$w = \frac{1}{2}$$

---

31.  $4(a - 12) = 3(a + 5)$

---

32.  $-2(a - 6) = 4(a - 3)$

**Solution**

$$a = 4$$

---

$$33. 2(5 - u) = -3(2u + 6)$$

---

$$34. 5(8 - r) = -2(2r - 16)$$

**Solution**

$$r = 8$$

---

$$35. 3(4n - 1) - 2 = 8n + 3$$

---

$$36. 9(2m - 3) - 8 = 4m + 7$$

**Solution**

$$m = 3$$

---

$$37. 12 + 2(5 - 3y) = -9(y - 1) - 2$$

---

$$38. -15 + 4(2 - 5y) = -7(y - 4) + 4$$

**Solution**

$$y = -3$$

---

$$39. 8(x - 4) - 7x = 14$$

---

**40.**  $5(x - 4) - 4x = 14$

**Solution**

$x = 34$ 

---

**41.**  $5 + 6(3s - 5) = -3 + 2(8s - 1)$ 

---

**42.**  $-12 + 8(x - 5) = -4 + 3(5x - 2)$

**Solution**

$x = -6$ 

---

**43.**  $4(u - 1) - 8 = 6(3u - 2) - 7$ 

---

**44.**  $7(2n - 5) = 8(4n - 1) - 9$

**Solution**

$n = -1$ 

---

**45.**  $4(p - 4) - (p + 7) = 5(p - 3)$ 

---

**46.**  $3(a - 2) - (a + 6) = 4(a - 1)$

**Solution**

$a = -4$ 

---

$$47. -(9y + 5) - (3y - 7) = 16 - (4y - 2)$$

---

$$48. -(7m + 4) - (2m - 5) = 14 - (5m - 3)$$

**Solution**

$$m = -4$$

---

$$49. 4[5 - 8(4c - 3)] = 12(1 - 13c) - 8$$

---

$$50. 5[9 - 2(6d - 1)] = 11(4 - 10d) - 139$$

**Solution**

$$d = -3$$

---

$$51. 3[-9 + 8(4h - 3)] = 2(5 - 12h) - 19$$

---

$$52. 3[-14 + 2(15k - 6)] = 8(3 - 5k) - 24$$

**Solution**

$$k = \frac{3}{5}$$

---

$$53. 5[2(m + 4) + 8(m - 7)] = 2[3(5 + m) - (21 - 3m)]$$

---

54.  $10 [5(n + 1) + 4(n - 1)] = 11 [7(5 + n) - (25 - 3n)]$

**Solution**

$$n = -5$$

---

55.  $5(1.2u - 4.8) = -12$

---

56.  $4(2.5v - 0.6) = 7.6$

**Solution**

$$v = 1$$

---

57.  $0.25(q - 6) = 0.1(q + 18)$

---

58.  $0.2(p - 6) = 0.4(p + 14)$

**Solution**

$$p = -34$$

---

59.  $0.2(30n + 50) = 28$

---

60.  $0.5(16m + 34) = -15$

**Solution**

$$m = -4$$

## Exercises: Classify Equations

Instructions: For questions 61-80, classify each equation as a conditional equation, an identity, or a contradiction and then state the solution.

61.  $23z + 19 = 3(5z - 9) + 8z + 46$

---

62.  $15y + 32 = 2(10y - 7) - 5y + 46$

**Solution**

identity; all real numbers

---

63.  $5(b - 9) + 4(3b + 9) = 6(4b - 5) - 7b + 21$

---

64.  $9(a - 4) + 3(2a + 5) = 7(3a - 4) - 6a + 7$

**Solution**

identity; all real numbers

---

65.  $18(5j - 1) + 29 = 47$

---

66.  $24(3d - 4) + 100 = 52$

**Solution**

conditional equation;  $d = \frac{2}{3}$

---

67.  $22(3m - 4) = 8(2m + 9)$

---

68.  $30(2n - 1) = 5(10n + 8)$

**Solution**

conditional equation;  $n = 7$

---

69.  $7v + 42 = 11(3v + 8) - 2(13v - 1)$

---

70.  $18u - 51 = 9(4u + 5) - 6(3u - 10)$

**Solution**

contradiction; no solution

---

71.  $3(6q - 9) + 7(q + 4) = 5(6q + 8) - 5(q + 1)$

---

72.  $5(p + 4) + 8(2p - 1) = 9(3p - 5) - 6(p - 2)$

**Solution**

contradiction; no solution

---

73.  $12(6h - 1) = 8(8h + 5) - 4$

---

74.  $9(4k - 7) = 11(3k + 1) + 4$

**Solution**

conditional equation;  $k = 26$

---

75.  $45(3y - 2) = 9(15y - 6)$

---

76.  $60(2x - 1) = 15(8x + 5)$

**Solution**

contradiction; no solution

---

77.  $16(6n + 15) = 48(2n + 5)$

---

78.  $36(4m + 5) = 12(12m + 15)$

**Solution**

identity; all real numbers

---

79.  $9(14d + 9) + 4d = 13(10d + 6) + 3$

---

$$80. 11(8c + 5) - 8c = 2(40c + 25) + 5$$

**Solution**

identity; all real numbers

## Exercises: Everyday Math

Instructions: For questions 81-82, answer the given everyday math word problems.

**81. Fencing.** Micah has 44 feet of fencing to make a dog run in his yard. He wants the length to be 2.5 feet more than the width. Find the length,  $L$ , by solving the equation  $2L + 2(L - 2.5) = 44$ .

---

**89. Coins.** Rhonda has \$1.90 in nickels and dimes. The number of dimes is one less than twice the number of nickels. Find the number of nickels,  $n$ , by solving the equation  $0.05n + 0.10(2n - 1) = 1.90$ .

**Solution**

8 nickels

## Exercises: Writing Exercises

Instructions: For questions 90-93, answer the given writing exercises.

**90. Using your own words, list the steps in the general strategy for solving linear equations.**

---

**91. Explain why you should simplify both sides of an equation as much as possible before collecting the variable terms to one side and the constant terms to the other side.**

**Solution**

Answers will vary.

---

**92. What is the first step you take when solving the equation  $3 - 7(y - 4) = 38$ ? Why is this your first step?**

---

**93. Solve the equation  $\frac{1}{4}(8x + 20) = 3x - 4$  explaining all the steps of your solution as in the examples in this section.**

**Solution**

Answers will vary.

# EXERCISES: SOLVE EQUATIONS WITH FRACTIONS OR DECIMALS (3.5)

---

## Exercises: Solve Equations with Fraction Coefficients

Instructions: For questions 1-36, solve each equation with fraction coefficients.

1.  $\frac{1}{4}x - \frac{1}{2} = -\frac{3}{4}$

---

2.  $\frac{3}{4}x - \frac{1}{2} = \frac{1}{4}$

**Solution**

$$x = 1$$

---

3.  $\frac{5}{6}y - \frac{2}{3} = -\frac{3}{2}$

---

4.  $\frac{5}{6}y - \frac{1}{3} = -\frac{7}{6}$

**Solution**

$$y = -1$$

---

$$5. \frac{1}{2}a + \frac{3}{8} = \frac{3}{4}$$

---

$$6. \frac{5}{8}b + \frac{1}{2} = -\frac{3}{4}$$

**Solution**

$$b = -2$$

---

$$7. 2 = \frac{1}{3}x - \frac{1}{2}x + \frac{2}{3}x$$

---

$$8. 2 = \frac{3}{5}x - \frac{1}{3}x + \frac{2}{5}x$$

**Solution**

$$x = 3$$

---

$$9. \frac{1}{4}m - \frac{4}{5}m + \frac{1}{2}m = -1$$

---

$$10. \frac{5}{6}n - \frac{1}{4}n - \frac{1}{2}n = -2$$

**Solution**

$$n = -24$$

---

$$11. x + \frac{1}{2} = \frac{2}{3}x - \frac{1}{2}$$

---

$$12. x + \frac{3}{4} = \frac{1}{2}x - \frac{5}{4}$$

**Solution**

$$x = -4$$

---

$$13. \frac{1}{3}w + \frac{5}{4} = w - \frac{1}{4}$$

---

$$14. \frac{3}{2}z + \frac{1}{3} = z - \frac{2}{3}$$

**Solution**

$$z = -2$$

---

$$15. \frac{1}{2}x - \frac{1}{4} = \frac{1}{12}x + \frac{1}{6}$$

---

$$16. \frac{1}{2}a - \frac{1}{4} = \frac{1}{6}a + \frac{1}{12}$$

**Solution**

$$a = 1$$

---

$$17. \frac{1}{3}b + \frac{1}{5} = \frac{2}{5}b - \frac{3}{5}$$

---

$$18. \frac{1}{3}x + \frac{2}{5} = \frac{1}{5}x - \frac{2}{5}$$

**Solution**

$$x = -6$$

---

$$19. 1 = \frac{1}{6}(12x - 6)$$

---

$$20. 1 = \frac{1}{5}(15x - 10)$$

**Solution**

$$x = 1$$

---

$$21. \frac{1}{4}(p - 7) = \frac{1}{3}(p + 5)$$

---

$$22. \frac{1}{5}(q + 3) = \frac{1}{2}(q - 3)$$

**Solution**

$$q = 7$$

---

$$23. \frac{1}{2}(x + 4) = \frac{3}{4}$$

---

$$24. \frac{1}{3}(x + 5) = \frac{5}{6}$$

**Solution**

$$x = -\frac{5}{2}$$

---

$$25. \frac{5q - 8}{5} = \frac{2q}{10}$$

---

$$26. \frac{4m + 2}{6} = \frac{m}{3}$$

**Solution**

$$m = -1$$

---

$$27. \frac{4n + 8}{4} = \frac{n}{3}$$

---

$$28. \frac{3p + 6}{3} = \frac{p}{2}$$

**Solution**

$$p = -4$$

---

$$29. \frac{u}{3} - 4 = \frac{u}{2} - 3$$

---

$$30. \frac{v}{10} + 1 = \frac{v}{4} - 2$$

**Solution**

$$v = 20$$

---

$$31. \frac{c}{15} + 1 = \frac{c}{10} - 1$$

---

$$32. \frac{d}{6} + 3 = \frac{d}{8} + 2$$

**Solution**

$$d = -24$$

---

$$33. \frac{3x + 4}{2} + 1 = \frac{5x + 10}{8}$$

---

$$34. \frac{10y - 2}{3} + 3 = \frac{10y + 1}{9}$$

**Solution**

$$y = -1$$

---

$$35. \frac{7u - 1}{4} - 1 = \frac{4u + 8}{5}$$

---

$$36. \frac{3v - 6}{2} + 5 = \frac{11v - 4}{5}$$

**Solution**

$$v = 4$$

### Exercises: Solve Equations with Decimal Coefficients

Instructions: For questions 37-52, solve each equation with decimal coefficients.

$$37. 0.6y + 3 = 9$$

---

$$38. 0.4y - 4 = 2$$

**Solution**

$$y = 15$$

---

$$39. 3.6j - 2 = 5.2$$

---

$$40. 2.1k + 3 = 7.2$$

**Solution**

$$k = 2$$

---

**41.**  $0.4x + 0.6 = 0.5x - 1.2$ 

---

**42.**  $0.7x + 0.4 = 0.6x + 2.4$

**Solution**

$x = 20$ 

---

**43.**  $0.23x + 1.47 = 0.37x - 1.05$ 

---

**44.**  $0.48x + 1.56 = 0.58x - 0.64$

**Solution**

$x = 22$ 

---

**45.**  $0.9x - 1.25 = 0.75x + 1.75$ 

---

**46.**  $1.2x - 0.91 = 0.8x + 2.29$

**Solution**

$x = 8$ 

---

**47.**  $0.05n + 0.10(n + 8) = 2.15$ 

---

**48.**  $0.05n + 0.10(n + 7) = 3.55$

**Solution**

$$n = 19$$

---

$$49. 0.10d + 0.25(d + 5) = 4.05$$

---

$$50. 0.10d + 0.25(d + 7) = 5.25$$

**Solution**

$$d = 10$$

---

$$51. 0.05(q - 5) + 0.25q = 3.05$$

---

$$52. 0.05(q - 8) + 0.25q = 4.10$$

**Solution**

$$q = 15$$

### Exercises: Everyday Math

Instructions: For questions 53-54, answer the given everyday math word problems.

**53. Coins.** Taylor has \$2.00 in dimes and pennies. The number of pennies is 2 more than the number of dimes. Solve the equation  $0.10d + 0.01(d + 2) = 2$  for  $d$ , the number of dimes.

---

**54. Stamps.** Paula bought \$22.82 worth of 49-cent stamps and 21-cent stamps. The number of 21-cent stamps was 8 less than the number of 49-cent stamps. Solve the equation  $0.49s + 0.21(s - 8) = 22.82$  for  $s$ , to find the number of 49-cent stamps Paula bought.

**Solution**

$$s = 35$$

## Exercises: Writing Exercises

Instructions: For questions 55-58, answer the given writing exercises.

**55. Explain how you find the least common denominator of  $\frac{3}{8}$ ,  $\frac{1}{6}$ , and  $\frac{2}{3}$ .**

---

**56. If an equation has several fractions, how does multiplying both sides by the LCD make it easier to solve?**

**Solution**

Answers will vary.

---

**57. If an equation has fractions only on one side, why do you have to multiply both sides of the equation by the LCD?**

---

**58. In the equation  $0.35x + 2.1 = 3.85$  what is the LCD? How do you know?**

**Solution**

100. Justifications will vary.

# EXERCISES: SOLVE A FORMULA FOR A SPECIFIC VARIABLE (3.6)

---

## Exercises: Use the Distance, Rate, and Time Formula

Instructions: For questions 1-12, solve.

1. Steve drove for  $8\frac{1}{2}$  hours at 72 miles per hour. How much distance did he travel?
- 

2. Socorro drove for  $4\frac{5}{6}$  hours at 60 miles per hour. How much distance did she travel?

**Solution**

290 miles

---

3. Yuki walked for  $1\frac{3}{4}$  hours at 4 miles per hour. How far did she walk?
- 

4. Francie rode her bike for  $2\frac{1}{2}$  hours at 12 miles per hour. How far did she ride?

**Solution**

30 miles

---

**5. Connor wants to drive from Tucson to the Grand Canyon, a distance of 338 miles. If he drives at a steady rate of 52 miles per hour, how many hours will the trip take?**

---

**6. Megan is taking the bus from New York City to Montreal. The distance is 380 miles and the bus travels at a steady rate of 76 miles per hour. How long will the bus ride be?**

**Solution**

5 hours

---

**7. Aurelia is driving from Miami to Orlando at a rate of 65 miles per hour. The distance is 235 miles. To the nearest tenth of an hour, how long will the trip take?**

---

**8. Kareem wants to ride his bike from St. Louis to Champaign, Illinois. The distance is 180 miles. If he rides at a steady rate of 16 miles per hour, how many hours will the trip take?**

**Solution**

11.25 hours

---

**9. Javier is driving to Bangor, 240 miles away. If he needs to be in Bangor in 4 hours, at what rate does he need to drive?**

---

**10. Alejandra is driving to Cincinnati, 450 miles away. If she wants to be there in 6 hours, at what rate does she need to drive?**

**Solution**

75 mph

---

11. Aisha took the train from Spokane to Seattle. The distance is 280 miles and the trip took 3.5 hours. What was the speed of the train?

---

12. Philip got a ride with a friend from Denver to Las Vegas, a distance of 750 miles. If the trip took 10 hours, how fast was the friend driving?

**Solution**

75 mph

### Exercises: Solve a Formula for a Specific Variable

Instructions: For questions 13-20, use the formula  $d = rt$ .

13. Solve for  $t$

a. when  $d = 350$  and  $r = 70$

b. in general

---

14. Solve for  $t$

a. when  $d = 240$  and  $r = 60$

b. in general

**Solution**

a.  $t = 4$

b.  $t = \frac{d}{r}$

---

15. Solve for  $t$

- a. when  $d = 510$  and  $r = 60$   
b. in general
- 

16. Solve for  $t$

- a. when  $d = 175$  and  $r = 50$   
b. in general

**Solution**

- a.  $t = 3.5$   
b.  $t = \frac{d}{r}$
- 

17. Solve for  $r$

- a. when  $d = 204$  and  $t = 3$   
b. in general
- 

18. Solve for  $r$

- a. when  $d = 420$  and  $t = 6$   
b. in general

**Solution**

- a.  $r = 70$   
b.  $r = \frac{d}{t}$
- 

19. Solve for  $r$

- a. when  $d = 160$  and  $t = 2.5$   
b. in general
-

20. Solve for  $r$

a. when  $d = 180$  and  $t = 4.5$

b. in general

**Solution**

a.  $r = 40$

b.  $r = \frac{d}{t}$

### Exercises: Use the Area of a Triangle Formula (Area, Base, and Height)

Instructions: For questions 21-24, use the formula  $A = \frac{1}{2}bh$ .

21. Solve for  $b$

a. when  $A = 126$  and  $h = 18$

b. in general

22. Solve for  $h$

a. when  $A = 176$  and  $b = 22$

b. in general

**Solution**

a.  $h = 16$

b.  $h = \frac{2A}{b}$

23. Solve for  $h$

- a. when  $A = 375$  and  $b = 25$   
 b. in general
- 

24. Solve for  $b$

- a. when  $A = 65$  and  $h = 13$   
 b. in general

**Solution**

- a.  $b = 10$   
 b.  $b = \frac{2A}{h}$

## Exercises: Use the Interest, Principal, Rate, and Time Formula

Instructions: For questions 25-28, use the formula  $I = Prt$

25. Solve for the principal,  $P$  for

- a.  $I = \$5,480$ ,  $r = 4\%$ ,  $t = 7$  years  
 b. in general
- 

26. Solve for the principal,  $P$  for

- a.  $I = \$3,950$ ,  $r = 6\%$ ,  $t = 5$  years  
 b. in general

**Solution**

- a.  $P = \$13,166.67$   
 b.  $P = \frac{I}{rt}$

27. Solve for the time,  $t$  for

a.  $I = \$2,376, P = \$9,000, r = 4.4\%$

b. in general

---

28. Solve for the time,  $t$  for

a.  $I = \$624, P = \$6,000, r = 5.2\%$

b. in general

**Solution**

a.  $t = 2$  years

b.  $t = \frac{I}{Pr}$

## Exercises: Solve a Formula for a Specific Variable

Instructions: For questions 29-50, solve.

29. Solve the formula  $2x + 3y = 12$  for  $y$

a. when  $x = 3$

b. in general

---

30. Solve the formula  $5x + 2y = 10$  for  $y$

a. when  $x = 4$

b. in general

**Solution**

a.  $y = -5$

b.  $y = \frac{10 - 5x}{2}$

---

**31. Solve the formula  $3x - y = 7$  for  $y$**

**a. when  $x = -2$**

**b. in general**

---

**32. Solve the formula  $4x + y = 5$  for  $y$**

**a. when  $x = -3$**

**b. in general**

**Solution**

a.  $y = 17$

b.  $y = 5 - 4x$

---

**33. Solve  $a + b = 90$  for  $b$ .**

---

**34. Solve  $a + b = 90$  for  $a$ .**

**Solution**

$$a = 90 - b$$

---

**35. Solve  $180 = a + b + c$  for  $a$ .**

---

**36. Solve  $180 = a + b + c$  for  $c$ .**

**Solution**

$$c = 180 - a - b$$

---

37. Solve the formula  $8x + y = 15$  for  $y$ .

---

38. Solve the formula  $9x + y = 13$  for  $y$ .

**Solution**

$$y = 13 - 9x$$

---

39. Solve the formula  $-4x + y = -6$  for  $y$ .

---

40. Solve the formula  $-5x + y = -1$  for  $y$ .

**Solution**

$$y = -1 + 5x$$

---

41. Solve the formula  $4x + 3y = 7$  for  $y$ .

---

42. Solve the formula  $3x + 2y = 11$  for  $y$ .

**Solution**

$$y = \frac{11 - 3x}{2}$$

---

43. Solve the formula  $x - y = -4$  for  $y$ .

---

**44. Solve the formula  $x - y = -3$  for  $y$ .**

**Solution**

$$y = 3 + x$$

---

**45. Solve the formula  $P = 2L + 2W$  for  $L$ .**

---

**46. Solve the formula  $P = 2L + 2W$  for  $W$ .**

**Solution**

$$W = \frac{P - 2L}{2}$$

---

**47. Solve the formula  $C = \pi d$  for  $d$ .**

---

**48. Solve the formula  $C = \pi d$  for  $\pi$ .**

**Solution**

$$\pi = \frac{C}{d}$$

---

**49. Solve the formula  $V = LWH$  for  $L$ .**

---

**50. Solve the formula  $V = LWH$  for  $H$ .**

**Solution**

$$H = \frac{V}{LW}$$

## Exercises: Everyday Math

Instructions: For questions 51-52, answer the given everyday math word problems.

**51. Converting temperature.** While on a tour in Greece, Tatyana saw that the temperature was  $40^\circ$  Celsius. Solve for  $F$  in the formula  $C = \frac{5}{9}(F - 32)$  to find the Fahrenheit temperature.

**52. Converting temperature.** Yon was visiting the United States and he saw that the temperature in Seattle one day was  $50^\circ$  Fahrenheit. Solve for  $C$  in the formula  $F = \frac{9}{5}C + 32$  to find the Celsius temperature.

**Solution**

$10^\circ \text{ C}$

## Exercises: Writing Exercises

Instructions: For questions 53-54, answer the given writing exercises.

**53. Solve the equation  $2x + 3y = 6$  for  $y$**

- when  $x = -3$
- in general
- Which solution is easier for you, a. or b.? Why?

**54. Solve the equation  $5x - 2y = 10$  for  $x$**

**a. when  $y = 10$**

**b. in general**

**c. Which solution is easier for you, a. or b.? Why?**

**Solution**

Answers will vary.

# EXERCISES: USE A PROBLEM-SOLVING STRATEGY AND APPLICATIONS (3.7)

---

## Exercises: Use the Approach Word Problems with a Positive Attitude

Instructions: For questions 1-2, prepare the lists described.

**1. List five positive thoughts you can say to yourself that will help you approach word problems with a positive attitude. You may want to copy them on a sheet of paper and put it in the front of your notebook, where you can read them often.**

**Solution**

Answers will vary

---

**2. List five negative thoughts that you have said to yourself in the past that will hinder your progress on word problems. You may want to write each one on a small piece of paper and rip it up to symbolically destroy the negative thoughts.**

---

## Exercises: Use a Problem-Solving Strategy for Word Problems

Instructions: For questions 3-14, solve using the problem solving strategy for word problems. Remember to write a complete sentence to answer each question.

**3. Two-thirds of the children in the fourth-grade class are girls. If there are 20 girls, what is the total number of children in the class?**

**Solution**

30 children

---

**4. Three-fifths of the members of the school choir are women. If there are 24 women, what is the total number of choir members?**

---

**5. Zachary has 25 country music CDs, which is one-fifth of his CD collection. How many CDs does Zachary have?**

**Solution**

125 CDs

---

**6. One-fourth of the candies in a bag of M&M's are red. If there are 23 red candies, how many candies are in the bag?**

---

**7. There are 16 girls in a school club. The number of girls is four more than twice the number of boys. Find the number of boys.**

**Solution**

6 boys

---

**8. There are 18 Cub Scouts in Pack 645. The number of scouts is three more than five times the number of adult leaders. Find the number of adult leaders.**

---

**9. Huong is organizing paperback and hardback books for her club's used book sale. The number of paperbacks is 12 less than three times the number of hardbacks. Huong had 162 paperbacks. How many hardback books were there?**

**Solution**

58 books

---

**10. Jeff is lining up children's and adult bicycles at the bike shop where he works. The number of children's bicycles is nine less than three times the number of adult bicycles. There are 42 adult bicycles. How many children's bicycles are there?**

---

**11. Philip pays \$1,620 in rent every month. This amount is \$120 more than twice what his brother Paul pays for rent. How much does Paul pay for rent?**

**Solution**

\$750

---

**12. Marc just bought an SUV for \$54,000. This is \$7,400 less than twice what his wife paid for her car last year. How much did his wife pay for her car?**

---

**13. Laurie has \$46,000 invested in stocks and bonds. The amount invested in stocks is \$8,000 less than three times the amount invested in bonds. How much does Laurie have invested in bonds?**

**Solution**

\$13,500

---

**14. Erica earned a total of \$50,450 last year from her two jobs. The amount she earned from her job at the store was \$1,250 more than three times the amount she earned from her job at the college. How much did she earn from her job at the college?**

---

## Exercises: Solve Number Problems

Instructions: For questions 15-56, solve each number word problem.

**15. The sum of a number and eight is 12. Find the number.**

**Solution**

4

---

**16. The sum of a number and nine is 17. Find the number.**

---

**17. The difference of a number and 12 is three. Find the number.**

**Solution**

15

---

**18. The difference of a number and eight is four. Find the number.**

---

**19. The sum of three times a number and eight is 23. Find the number.**

**Solution**

5

---

**20. The sum of twice a number and six is 14. Find the number.**

---

**21. The difference of twice a number and seven is 17. Find the number.**

**Solution**

12

---

**22. The difference of four times a number and seven is 21. Find the number.**

---

**23. Three times the sum of a number and nine is 12. Find the number.**

**Solution**

−5

---

**24. Six times the sum of a number and eight is 30. Find the number.**

---

**25. One number is six more than the other. Their sum is 42. Find the numbers.**

**Solution**

18, 24

---

**26. One number is five more than the other. Their sum is 33. Find the numbers.**

---

**27. The sum of two numbers is 20. One number is four less than the other. Find the numbers.**

**Solution**

8, 12

---

**28. The sum of two numbers is 27. One number is seven less than the other. Find the numbers.**

---

**29. The sum of two numbers is  $-45$ . One number is nine more than the other. Find the numbers.**

**Solution**

$-18, -27$

---

**30. The sum of two numbers is  $-61$ . One number is 35 more than the other. Find the numbers.**

---

**31. The sum of two numbers is  $-316$ . One number is 94 less than the other. Find the numbers.**

**Solution**

$-111, -205$

---

**32. The sum of two numbers is  $-284$ . One number is 62 less than the other. Find the numbers.**

---

**33. One number is 14 less than another. If their sum is increased by seven, the result is 85. Find the numbers.**

**Solution**

32, 46

---

**34. One number is 11 less than another. If their sum is increased by eight, the result is 71. Find the numbers.**

---

**35. One number is five more than another. If their sum is increased by nine, the result is 60. Find the numbers.**

**Solution**

23, 28

---

**36. One number is eight more than another. If their sum is increased by 17, the result is 95. Find the numbers.**

---

**37. One number is one more than twice another. Their sum is  $-5$ . Find the numbers.**

**Solution**

$-2, -3$

---

**38. One number is six more than five times another. Their sum is six. Find the numbers.**

---

**39. The sum of two numbers is 14. One number is two less than three times the other. Find the numbers.**

**Solution**

4, 10

---

**40. The sum of two numbers is zero. One number is nine less than twice the other. Find the numbers.**

---

**41. The sum of two consecutive integers is 77. Find the integers.**

**Solution**

38, 39

---

**42. The sum of two consecutive integers is 89. Find the integers.**

---

**43. The sum of two consecutive integers is  $-23$ . Find the integers.**

**Solution**

$-11, -12$

---

**44. The sum of two consecutive integers is  $-37$ . Find the integers.**

---

**45. The sum of three consecutive integers is 78. Find the integers.**

**Solution**

25, 26, 27

---

**46. The sum of three consecutive integers is 60. Find the integers.**

---

**47. Find three consecutive integers whose sum is  $-36$ .**

**Solution**

$-11, -12, -13$

---

**48. Find three consecutive integers whose sum is  $-3$ .**

---

**49. Find three consecutive even integers whose sum is 258.**

**Solution**

84, 86, 88

---

**50. Find three consecutive even integers whose sum is 222.**

---

**51. Find three consecutive odd integers whose sum is 171.**

**Solution**

55, 57, 59

---

**52. Find three consecutive odd integers whose sum is 291.**

---

**53. Find three consecutive even integers whose sum is  $-36$ .**

**Solution**

$-10, -12, -14$

---

**54. Find three consecutive even integers whose sum is  $-84$ .**

---

**55. Find three consecutive odd integers whose sum is  $-213$ .**

**Solution**

$-69, -71, -73$

---

**56. Find three consecutive odd integers whose sum is  $-267$ .**

---

## Exercises: Translate and Solve Basic Percent Equations

Instructions: For questions 57-80, translate and solve.

**57. What number is 45% of 120?**

**Solution**

54

---

**58. What number is 65% of 100?**

---

**59. What number is 24% of 112?**

**Solution**

26.88

---

**60. What number is 36% of 124?**

**Solution**

48.64

---

**61. 250% of 65 is what number?**

**Solution**

162.5

---

**62. 150% of 90 is what number?**

**Solution**

135

---

**63. 800% of 2250 is what number?**

**Solution**

18,000

---

**64. 600% of 1740 is what number?**

**Solution**

10,440

---

**65. 28 is 25% of what number?**

**Solution**

112

---

**66. 36 is 25% of what number?**

---

**67. 81 is 75% of what number?**

**Solution**

108

---

**68. 93 is 75% of what number?**

---

**69. 8.2% of what number is \$2.87?**

**Solution**

\$35

---

**70. 6.4% of what number is \$2.88?**

---

**71. 11.5% of what number is \$108.10?**

**Solution**

\$940

---

**72. 12.3% of what number is \$92.25?**

---

**73. What percent of 260 is 78?**

**Solution**

30%

---

**74. What percent of 215 is 86?**

---

**75. What percent of 1500 is 540?**

**Solution**

36%

---

**76. What percent of 1800 is 846?**

---

**77. 30 is what percent of 20?**

**Solution**

150%

---

**78. 50 is what percent of 40?**

---

**79. 840 is what percent of 480?**

**Solution**

175%

---

**80. 790 is what percent of 395?**

---

## Exercises: Solve Percent Applications

Instructions: For questions 81-98, solve.

**81. Geneva treated her parents to dinner at their favorite restaurant. The bill was \$74.25. Geneva wants to leave 16% of the total bill as a tip. How much should the tip be?**

**Solution**

\$11.88

---

**82. When Hiro and his co-workers had lunch at a restaurant near their work, the bill was \$90.50. They want to leave 18% of the total bill as a tip. How much should the tip be?**

---

**83. Trong has 12% of each paycheck automatically deposited to his savings account. His last paycheck was \$2165. How much money was deposited to Trong's savings account?**

**Solution**

\$259.80

---

**84. Cherise deposits 8% of each paycheck into her retirement account. Her last paycheck was \$1,485. How much did Cherise deposit into her retirement account?**

---

**85. One serving of oatmeal has eight grams of fiber, which is 33% of the recommended daily amount. What is the total recommended daily amount of fiber?**

**Solution**

24.2 g

---

**86. One serving of trail mix has 67 grams of carbohydrates, which is 22% of the recommended daily amount. What is the total recommended daily amount of carbohydrates?**

---

**87. A bacon cheeseburger at a popular fast food restaurant contains 2070 milligrams (mg) of sodium, which is 86% of the recommended daily amount. What is the total recommended daily amount of sodium?**

**Solution**

2407 mg

---

**88. A grilled chicken salad at a popular fast food restaurant contains 650 milligrams (mg) of sodium, which is 27% of the recommended daily amount. What is the total recommended daily amount of sodium?**

---

**89. After 3 months on a diet, Lisa had lost 12% of her original weight. She lost 21 pounds. What was Lisa's original weight?**

**Solution**

175 lb.

---

**90. Tricia got a 6% raise on her weekly salary. The raise was \$30 per week. What was her original salary?**

---

**91. Yuki bought a dress on sale for \$72. The sale price was 60% of the original price. What was the original price of the dress?**

**Solution**

\$120

---

**92. Kim bought a pair of shoes on sale for \$40.50. The sale price was 45% of the original price. What was the original price of the shoes?**

---

**93. Tim left a \$9 tip for a \$50 restaurant bill. What percent tip did he leave?**

**Solution**

18%

---

**94. Rashid left a \$15 tip for a \$75 restaurant bill. What percent tip did he leave?**

---

**95. The nutrition fact sheet at a fast food restaurant says the fish sandwich has 380 calories, and 171 calories are from fat. What percent of the total calories is from fat?**

**Solution**

45%

---

**96. The nutrition fact sheet at a fast food restaurant says a small portion of chicken nuggets has 190 calories, and 114 calories are from fat. What percent of the total calories is from fat?**

---

**97. Emma gets paid \$3,000 per month. She pays \$750 a month for rent. What percent of her**

**monthly pay goes to rent?**

**Solution**

25%

---

**98. Dimple gets paid 3,200 per month. She pays \$960 a month for rent. What percent of her monthly pay goes to rent?**

---

### **Exercises: Find Percent Increase and Percent Decrease**

Instructions: For questions 99-110, solve.

**99. Tamanika got a raise in her hourly pay, from \$15.50 to \$17.36. Find the percent increase.**

**Solution**

12%

---

**100. Ayodele got a raise in her hourly pay, from \$24.50 to \$25.48. Find the percent increase.**

---

**101. Annual student fees at the University of California rose from about \$4,000 in 2000 to about 12,000 in 2010. Find the percent increase.**

**Solution**

200%

---

**102. The price of a share of one stock rose from \$12.50 to \$50. Find the percent increase.**

---

**103. According to *Time* magazine annual global seafood consumption rose from 22 pounds per person in the 1960s to 38 pounds per person in 2011. Find the percent increase. (Round to the nearest tenth of a percent.)**

**Solution**

72.7%

---

**104. In one month, the median home price in the Northeast rose from \$225,400 to \$241,500. Find the percent increase. (Round to the nearest tenth of a percent.)**

---

**105. A grocery store reduced the price of a loaf of bread from \$2.80 to \$2.73. Find the percent decrease.**

**Solution**

2.5%

---

**106. The price of a share of one stock fell from \$8.75 to \$8.54. Find the percent decrease.**

---

**107. Hernando's salary was \$49,500 last year. This year his salary was cut to \$44,055. Find the percent decrease.**

**Solution**

11%

---

**108. In 10 years, the population of Detroit fell from 950,000 to about 712,500. Find the percent decrease.**

---

**109. In 1 month, the median home price in the West fell from \$203,400 to \$192,300. Find the percent decrease. (Round to the nearest tenth of a percent.)**

**Solution**

5.5%

---

**110. Sales of video games and consoles fell from \$1,150 million to \$1,030 million in 1 year. Find the percent decrease. (Round to the nearest tenth of a percent.)**

---

## Exercises: Solve Simple Interest Applications

Instructions: For questions 111-122, solve.

**111. Casey deposited \$1,450 in a bank account with interest rate 4%. How much interest was earned in two years?**

**Solution**

\$116

---

**112. Terrence deposited \$5,720 in a bank account with interest rate 6%. How much interest was earned in 4 years?**

---

**113. Robin deposited \$31,000 in a bank account with interest rate 5.2%. How much interest was earned in 3 years?**

**Solution**

\$4,836

---

**114. Carleen deposited \$16,400 in a bank account with interest rate 3.9%. How much interest was earned in 8 years?**

---

**115. Hilaria borrowed \$8,000 from her grandfather to pay for college. Five years later, she paid him back the \$8,000, plus \$1,200 interest. What was the rate of interest?**

**Solution**

3%

---

**116. Kenneth loaned his niece \$1,200 to buy a computer. Two years later, she paid him back the \$1,200, plus \$96 interest. What was the rate of interest?**

---

**117. Lebron loaned his daughter \$20,000 to help her buy a condominium. When she sold the condominium four years later, she paid him the \$20,000, plus \$3,000 interest. What was the rate of interest?**

**Solution**

3.75%

---

**118. Pablo borrowed \$50,000 to start a business. Three years later, he repaid the \$50,000, plus \$9,375 interest. What was the rate of interest?**

---

**119. In 10 years, a bank account that paid 5.25% earned \$18,375 interest. What was the principal of the account?**

**Solution**

\$35,000

---

**120. In 25 years, a bond that paid 4.75% earned \$2,375 interest. What was the principal of the bond?**

---

**121. Joshua's computer loan statement said he would pay \$1,244.34 in interest for a 3-year loan at 12.4%. How much did Joshua borrow to buy the computer?**

**Solution**

\$3,345

---

**122. Margaret's car loan statement said she would pay \$7,683.20 in interest for a 5-year loan at 9.8%. How much did Margaret borrow to buy the car?**

---

## Exercises: Solve Applications with Discount or Mark-up

Instructions: For questions 123-126, find the sale price.

**123. Perla bought a cell phone that was on sale for \$50 off. The original price of the cell phone was \$189.**

**Solution**

\$139

---

**124. Sophie saw a dress she liked on sale for \$15 off. The original price of the dress was \$96.**

---

**125. Rick wants to buy a tool set with original price \$165. Next week the tool set will be on sale for \$40 off.**

**Solution**

\$125

---

**126. Angelo's store is having a sale on televisions. One television, with original price \$859, is selling for \$125 off.**

---

## Exercises: Find Discount and Sales Price Amounts

Instructions: For questions 127-132, find

- a. the amount of discount
- b. the sale price.

**127. Janelle bought a beach chair on sale at 60% off. The original price was \$44.95.**

**Solution**

a. \$26.97

b. \$17.98

---

**128. Errol bought a skateboard helmet on sale at 40% off. The original price was \$49.95.**

---

**129. Kathy wants to buy a camera that lists for \$389. The camera is on sale with a 33% discount.**

**Solution**

a. \$128.37

b. \$260.63

---

**130. Colleen bought a suit that was discounted 25% from an original price of \$245.**

---

**131. Erys bought a treadmill on sale at 35% off. The original price was \$949.95 (round to the nearest cent.)**

**Solution**

a. \$332.48

b. \$617.47

---

**132. Jay bought a guitar on sale at 45% off. The original price was \$514.75 (round to the nearest cent.)**

---

## Exercises: Find Discount and Discount Rate Amounts

Instructions: For questions 133-138, find

- a. the amount of discount
- b. the discount rate (Round to the nearest tenth of a percent if needed)

**133. Larry and Donna bought a sofa at the sale price of \$1,344. The original price of the sofa was \$1,920.**

**Solution**

- a. \$576
  - b. 30%
- 

**134. Hiroshi bought a lawnmower at the sale price of \$240. The original price of the lawnmower is \$300.**

**135. Patty bought a baby stroller on sale for \$301.75. The original price of the stroller was \$355.**  
**Solution**

- a. \$53.25
  - b. 15%
- 

**136. Bill found a book he wanted on sale for \$20.80. The original price of the book was \$32.**

**137. Nikki bought a patio set on sale for \$480. The original price was \$850. To the nearest tenth of a percent, what was the rate of discount?**

**Solution**

- a. \$370
  - b. 43.5%
-

**138. Stella bought a dinette set on sale for \$725. The original price was \$1,299. To the nearest tenth of a percent, what was the rate of discount?**

---

## Exercises: Find Mark-up and List Price Amounts

Instructions: For questions 139-144, find

- a. the amount of the mark-up
- b. the list price.

**139. Daria bought a bracelet at original cost \$16 to sell in her handicraft store. She marked the price up 45%.**

**Solution**

- a. \$7.20
  - b. \$23.20
- 

**140. Regina bought a handmade quilt at original cost \$120 to sell in her quilt store. She marked the price up 55%.**

---

**141. Tom paid \$0.60 a pound for tomatoes to sell at his produce store. He added a 33% mark-up.**

**Solution**

- a. \$0.20
  - b. \$0.80
-

**142. Flora paid her supplier \$0.74 a stem for roses to sell at her flower shop. She added an 85% mark-up.**

---

**143. Alan bought a used bicycle for \$115. After re-conditioning it, he added 225% mark-up and then advertised it for sale.**

**Solution**

a. \$258.75

b. \$373.75

---

**144. Michael bought a classic car for \$8,500. He restored it, then added 150% mark-up before advertising it for sale.**

---

## Exercises: Everyday Math

Instructions: For questions 149-152, answer the given everyday math word problems.

**145. Sale Price.** Patty paid \$35 for a purse on sale for \$10 off the original price. What was the original price of the purse?

**Solution**

\$45

---

**146. Sale Price.** Travis bought a pair of boots on sale for \$25 off the original price. He paid \$60 for the boots. What was the original price of the boots?

---

**147. Buying in Bulk.** Minh spent \$6.25 on five sticker books to give his nephews. Find the cost of each sticker book.

**Solution**

\$1.25

---

**148. Buying in Bulk.** Alicia bought a package of eight peaches for \$3.20. Find the cost of each peach.

---

**149. Price before Sales Tax.** Tom paid 1,166.40 for a new refrigerator, including \$86.40 tax. What was the price of the refrigerator?

**Solution**

\$1080

---

**150. Price before Sales Tax.** Kenji paid 2,279 for a new living room set, including \$129 tax. What was the price of the living room set?

---

**151. Leaving a Tip.** At the campus coffee cart, a medium coffee costs \$1.65. MaryAnne brings \$2.00 with her when she buys a cup of coffee and leaves the change as a tip. What percent tip does she leave?

**Solution**

21.2%

---

**152. Splitting a Bill.** Four friends went out to lunch and the bill came to \$53.75. They decided to add enough tip to make a total of \$64, so that they could easily split the bill evenly among themselves. What percent tip did they leave?

---

## Exercises: Writing Exercises

Instructions: For questions 153-160, answer the given writing exercises.

**153. What has been your past experience solving word problems?**

**Solution**

Answers will vary.

---

**154. When you start to solve a word problem, how do you decide what to let the variable represent?**

---

**155. What are consecutive odd integers? Name three consecutive odd integers between 50 and 60.**

**Solution**

Consecutive odd integers are odd numbers that immediately follow each other. An example of three consecutive odd integers between 50 and 60 would be 51, 53, and 55.

---

**156. What are consecutive even integers? Name three consecutive even integers between  $-50$  and  $-40$ .**

---

**157. Without solving the problem “44 is 80% of what number” think about what the solution might be. Should it be a number that is greater than 44 or less than 44? Explain your reasoning.**

**Solution**

The number should be greater than 44. Since 80% equals 0.8 in decimal form, 0.8 is less than one, and we must multiply the number by 0.8 to get 44, the number must be greater than 44.

---

**158. Without solving the problem “What is 20% of 300?” think about what the solution might be. Should it be a number that is greater than 300 or less than 300? Explain your reasoning.**

---

**159. After returning from vacation, Alex said he should have packed 50% fewer shorts and 200% more shirts. Explain what Alex meant.**

**Solution**

He meant that he should have packed half the shorts and twice the shirts.

---

**160. Because of road construction in one city, commuters were advised to plan that their Monday morning commute would take 150% of their usual commuting time. Explain what this means.**

# EXERCISES: SOLVE MIXTURE AND UNIFORM MOTION APPLICATIONS (3.8)

---

## Exercises: Solve Coin Word Problems

Instructions: For questions 1-18, solve each coin word problem.

**1. Jaime has \$2.60 in dimes and nickels. The number of dimes is 14 more than the number of nickels. How many of each coin does he have?**

**Solution**

8 nickels, 22 dimes

---

**2. Lee has \$1.75 in dimes and nickels. The number of nickels is 11 more than the number of dimes. How many of each coin does he have?**

---

**3. Ngo has a collection of dimes and quarters with a total value of \$3.50. The number of dimes is seven more than the number of quarters. How many of each coin does he have?**

**Solution**

15 dimes, 8 quarters

---

**4. Connor has a collection of dimes and quarters with a total value of \$6.30. The number of dimes is 14 more than the number of quarters. How many of each coin does he have?**

---

**5. A cash box of \$1 and \$5 bills is worth \$45. The number of \$1 bills is three more than the number of \$5 bills. How many of each bill does it contain?**

**Solution**

10 at \$1, 7 at \$5

---

**6. Joe's wallet contains \$1 and \$5 bills worth \$47. The number of \$1 bills is five more than the number of \$5 bills. How many of each bill does he have?**

---

**7. Rachelle has \$6.30 in nickels and quarters in her coin purse. The number of nickels is twice the number of quarters. How many coins of each type does she have?**

**Solution**

18 quarters, 36 nickels

---

**8. Deloise has \$1.20 in pennies and nickels in a jar on her desk. The number of pennies is three times the number of nickels. How many coins of each type does she have?**

---

**9. Harrison has \$9.30 in his coin collection, all in pennies and dimes. The number of dimes is three times the number of pennies. How many coins of each type does he have?**

**Solution**

30 pennies, 90 dimes

---

**10. Ivan has \$8.75 in nickels and quarters in his desk drawer. The number of nickels is twice the number of quarters. How many coins of each type does he have?**

---

**11. In a cash drawer there is \$125 in \$5 and \$10 bills. The number of \$10 bills is twice the number of \$5 bills. How many of each are in the drawer?**

**Solution**

10 at \$10, 5 at \$5

---

**12. John has \$175 in \$5 and \$10 bills in his drawer. The number of \$5 bills is three times the number of \$10 bills. How many of each are in the drawer?**

---

**13. Carolyn has \$2.55 in her purse in nickels and dimes. The number of nickels is nine less than three times the number of dimes. Find the number of each type of coin.**

**Solution**

12 dimes and 27 nickels

---

**14. Julio has \$2.75 in his pocket in nickels and dimes. The number of dimes is 10 less than twice the number of nickels. Find the number of each type of coin.**

---

**15. Chi has \$11.30 in dimes and quarters. The number of dimes is three more than three times the number of quarters. How many of each are there?**

**Solution**

63 dimes, 20 quarters

---

**16. Tyler has \$9.70 in dimes and quarters. The number of quarters is eight more than four times the number of dimes. How many of each coin does he have?**

---

**17. Mukul has \$3.75 in quarters, dimes and nickels in his pocket. He has five more dimes than quarters and nine more nickels than quarters. How many of each coin are in his pocket?**

**Solution**

16 nickels, 12 dimes, 7 quarters

---

**18. Vina has \$4.70 in quarters, dimes and nickels in her purse. She has eight more dimes than quarters and six more nickels than quarters. How many of each coin are in her purse?**

---

## Exercises: Solve Ticket and Stamp Word Problems

Instructions: For questions 19-32, solve each ticket or stamp word problem.

**19. The school play sold \$550 in tickets one night. The number of \$8 adult tickets was 10 less than twice the number of \$5 child tickets. How many of each ticket were sold?**

**Solution**

30 child tickets, 50 adult tickets

---

**20. If the number of \$8 child tickets is seventeen less than three times the number of \$12 adult tickets and the theater took in \$584, how many of each ticket were sold?**

---

**21. The movie theater took in \$1,220 one Monday night. The number of \$7 child tickets was ten more than twice the number of \$9 adult tickets. How many of each were sold?**

**Solution**

110 child tickets, 50 adult tickets

---

**22. The ball game sold \$1,340 in tickets one Saturday. The number of \$12 adult tickets was 15 more than twice the number of \$5 child tickets. How many of each were sold?**

---

**23. The ice rink sold 95 tickets for the afternoon skating session, for a total of \$828. General admission tickets cost \$10 each and youth tickets cost \$8 each. How many general admission tickets and how many youth tickets were sold?**

**Solution**

34 general, 61 youth

---

**24. For the 7:30 show time, 140 movie tickets were sold. Receipts from the \$13 adult tickets and the \$10 senior tickets totaled 1,664. How many adult tickets and how many senior tickets were sold?**

---

**25. The box office sold 360 tickets to a concert at the college. The total receipts were \$4,170. General admission tickets cost \$15 and student tickets cost \$10. How many of each kind of ticket was sold?**

**Solution**

114 general, 246 student

---

**26. Last Saturday, the museum box office sold 281 tickets for a total of \$3,954. Adult tickets cost \$15 and student tickets cost \$12. How many of each kind of ticket was sold?**

---

**27. Julie went to the post office and bought both \$0.41 stamps and \$0.26 postcards. She spent \$51.40. The number of stamps was 20 more than twice the number of postcards. How many of each did she buy?**

**Solution**

40 postcards, 100 stamps

---

**28. Jason went to the post office and bought both \$0.41 stamps and \$0.26 postcards and spent \$10.28. The number of stamps was four more than twice the number of postcards. How many of each did he buy?**

---

**29. Maria spent \$12.50 at the post office. She bought three times as many \$0.41 stamps as \$0.02 stamps. How many of each did she buy?**

**Solution**

30 at \$0.41, 10 at \$0.02

---

**30. Hector spent \$33.20 at the post office. He bought four times as many \$0.41 stamps as \$0.02 stamps. How many of each did he buy?**

---

**31. Hilda has \$210 worth of \$10 and \$12 stock shares. The numbers of \$10 shares is five more than twice the number of \$12 shares. How many of each does she have?**

**Solution**

15 \$10 shares, 5 \$12 shares

---

**32. Mario invested \$475 in \$45 and \$25 stock shares. The number of \$25 shares was five less than three times the number of \$45 shares. How many of each type of share did he buy?**

---

## Exercises: Solve Mixture Word Problems

Instructions: For questions 33-44, solve each mixture word problem.

**33. Lauren is making 15 liters of mimosas for a brunch banquet. Orange juice costs her \$1.50 per liter and champagne costs her \$12 per liter. How many liters of orange juice and how many liters of champagne should she use for the mimosas to cost Lauren \$5 per liter?**

**Solution**

5 liters champagne, 10 liters orange juice

---

**34. Macario is making 12 pounds of nut mixture with macadamia nuts and almonds. Macadamia nuts cost \$9 per pound and almonds cost \$5.25 per pound. How many pounds of macadamia nuts and how many pounds of almonds should Macario use for the mixture to cost \$6.50 per pound to make?**

---

**35. Kaapo is mixing Kona beans and Maui beans to make 25 pounds of coffee blend. Kona beans cost Kaapo \$15 per pound and Maui beans cost \$24 per pound. How many pounds of each coffee bean should Kaapo use for his blend to cost him \$17.70 per pound?**

**Solution**

7.5 lbs Maui beans, 17.5 Kona beans

---

**36. Estelle is making 30 pounds of fruit salad from strawberries and blueberries. Strawberries cost \$1.80 per pound and blueberries cost \$4.50 per pound. If Estelle wants the fruit salad to cost her \$2.52 per pound, how many pounds of each berry should she use?**

---

**37. Carmen wants to tile the floor of his house. He will need 1000 square feet of tile. He will do most of the floor with a tile that costs \$1.50 per square foot, but also wants to use an accent tile that costs \$9.00 per square foot. How many square feet of each tile should he plan to use if he wants the overall cost to be \$3 per square foot?**

**Solution**

800 at \$1.50, 200 at \$9.00

---

**38. Riley is planning to plant a lawn in his yard. He will need nine pounds of grass seed. He wants to mix Bermuda seed that costs \$4.80 per pound with Fescue seed that costs \$3.50 per pound. How much of each seed should he buy so that the overall cost will be \$4.02 per pound?**

---

**39. Vartan was paid \$25,000 for a cell phone app that he wrote and wants to invest it to save for his son's education. He wants to put some of the money into a bond that pays 4% annual interest and the rest into stocks that pay 9% annual interest. If he wants to earn 7.4% annual interest on the total amount, how much money should he invest in each account?**

**Solution**

\$8,000 at 4%, \$17,000 at 9%

---

**40. Vern sold his 1964 Ford Mustang for \$55,000 and wants to invest the money to earn him 5.8% interest per year. He will put some of the money into Fund A that earns 3% per year and the rest in Fund B that earns 10% per year. How much should he invest into each fund if he wants to earn 5.8% interest per year on the total amount?**

---

**41. Stephanie inherited \$40,000. She wants to put some of the money in a certificate of deposit that pays 2.1% interest per year and the rest in a mutual fund account that pays 6.5% per year. How much should she invest in each account if she wants to earn 5.4% interest per year on the total amount?**

**Solution**

\$10,000 in CD, \$30,000 in mutual fund

---

**42. Avery and Caden have saved \$27,000 towards a down payment on a house. They want to keep some of the money in a bank account that pays 2.4% annual interest and the rest in a stock fund that pays 7.2% annual interest. How much should they put into each account so that they earn 6% interest per year?**

---

**43. Dominic pays 7% interest on his \$15,000 college loan and 12% interest on his \$11,000 car loan. What average interest rate does he pay on the total \$26,000 he owes? (Round your answer to the nearest tenth of a percent.)**

**Solution**

9.1%

---

**44. Liam borrowed a total of \$35,000 to pay for college. He pays his parents 3% interest on the \$8,000 he borrowed from them and pays the bank 6.8% on the rest. What average interest rate does he pay on the total \$35,000? (Round your answer to the nearest tenth of a percent.)**

---

## Exercises: Solve Uniform Motion Applications

Instructions: For questions 45-66, solve.

**45. Lilah is moving from Portland to Seattle. It takes her three hours to go by train. Mason leaves the train station in Portland and drives to the train station in Seattle with all Lilah's boxes in his car. It takes him 2.4 hours to get to Seattle, driving at 15 miles per hour faster than the speed of**

**the train. Find Mason's speed and the speed of the train.**

**Solution**

Mason 75 mph, train 60 mph

---

**46. Kathy and Cheryl are walking in a fundraiser. Kathy completes the course in 4.8 *hours* and Cheryl completes the course in 8 hours. Kathy walks two miles per hour faster than Cheryl. Find Kathy's speed and Cheryl's speed.**

---

**47. Two buses go from Sacramento for San Diego. The express bus makes the trip in 6.8 hours and the local bus takes 10.2 hours for the trip. The speed of the express bus is 25 mph faster than the speed of the local bus. Find the speed of both buses.**

**Solution**

express bus 75 mph, local 50 mph

---

**48. A commercial jet and a private airplane fly from Denver to Phoenix. It takes the commercial jet 1.1 hours for the flight, and it takes the private airplane 1.8 hours. The speed of the commercial jet is 210 miles per hour faster than the speed of the private airplane. Find the speed of both airplanes.**

---

**49. Saul drove his truck 3 hours from Dallas towards Kansas City and stopped at a truck stop to get dinner. At the truck stop he met Erwin, who had driven 4 hours from Kansas City towards Dallas. The distance between Dallas and Kansas City is 542 miles, and Erwin's speed was eight miles per hour slower than Saul's speed. Find the speed of the two truckers.**

**Solution**

Saul 82 mph, Erwin 74 mph

---

**50. Charlie and Violet met for lunch at a restaurant between Memphis and New Orleans. Charlie had left Memphis and drove 4.8 hours towards New Orleans. Violet had left New Orleans and drove 2 hours towards Memphis, at a speed 10 miles per hour faster than Charlie's speed. The distance between Memphis and New Orleans is 394 miles. Find the speed of the two drivers.**

---

**51. Sisters Helen and Anne live 332 miles apart. For Thanksgiving, they met at their other sister's house partway between their homes. Helen drove 3.2 hours and Anne drove 2.8 hours. Helen's average speed was four miles per hour faster than Anne's. Find Helen's average speed and Anne's average speed.**

**Solution**

Helen 60 mph, Anne 56 mph

---

**52. Ethan and Leo start riding their bikes at the opposite ends of a 65-mile bike path. After Ethan has ridden 1.5 hours and Leo has ridden 2 hours, they meet on the path. Ethan's speed is six miles per hour faster than Leo's speed. Find the speed of the two bikers.**

---

**53. Elvira and Aletheia live 3.1 miles apart on the same street. They are in a study group that meets at a coffee shop between their houses. It took Elvira half an hour and Aletheia two-thirds of an hour to walk to the coffee shop. Aletheia's speed is 0.6 miles per hour slower than Elvira's speed. Find both women's walking speeds.**

**Solution**

Aletheia 2.4 mph, Elvira 3 mph

---

**54. DaMarcus and Fabian live 23 miles apart and play soccer at a park between their homes. DaMarcus rode his bike for three-quarters of an hour and Fabian rode his bike for half an hour to get to the park. Fabian's speed was six miles per hour faster than DaMarcus' speed. Find the speed of both soccer players.**

---

**55. Cindy and Richard leave their dorm in Charleston at the same time. Cindy rides her bicycle north at a speed of 18 miles per hour. Richard rides his bicycle south at a speed of 14 miles per hour. How long will it take them to be 96 miles apart?**

**Solution**

3 hours

---

**56. Matt and Chris leave their uncle's house in Phoenix at the same time. Matt drives west on I-60 at a speed of 76 miles per hour. Chris drives east on I-60 at a speed of 82 miles per hour. How many hours will it take them to be 632 miles apart?**

---

**57. Two buses leave Billings at the same time. The Seattle bus heads west on I-90 at a speed of 73 miles per hour while the Chicago bus heads east at a speed of 79 miles an hour. How many hours will it take them to be 532 miles apart?**

**Solution**

3.5 hours

---

**58. Two boats leave the same dock in Cairo at the same time. One heads north on the Mississippi River while the other heads south. The northbound boat travels four miles per hour. The southbound boat goes eight miles per hour. How long will it take them to be 54 miles apart?**

---

**59. Lorena walks the path around the park in 30 minutes. If she jogs, it takes her 20 minutes. Her jogging speed is 1.5 miles per hour faster than her walking speed. Find Lorena's walking speed and jogging speed.**

**Solution**

walking 3 mph, jogging 4.5 mph

---

**60. Julian rides his bike uphill for 45 minutes, then turns around and rides back downhill. It takes him 15 minutes to get back to where he started. His uphill speed is 3.2 miles per hour slower than his downhill speed. Find Julian's uphill and downhill speed.**

---

**61. Cassius drives his boat upstream for 45 minutes. It takes him 30 minutes to return downstream. His speed going upstream is three miles per hour slower than his speed going downstream. Find his upstream and downstream speeds.**

**Solution**

upstream 6 mph, downstream 9 mph

---

**62. It takes Darline 20 minutes to drive to work in light traffic. To come home, when there is heavy traffic, it takes her 36 minutes. Her speed in light traffic is 24 miles per hour faster than her speed in heavy traffic. Find her speed in light traffic and in heavy traffic.**

---

**63. At 1:30, Marlon left his house to go to the beach, a distance of 7.6 miles. He rode his skateboard until 2:15, then walked the rest of the way. He arrived at the beach at 3:00. Marlon's speed on his skateboard is 2.5 times his walking speed. Find his speed when skateboarding and when walking.**

**Solution**

skateboarding 8 mph, walking 3.2 mph

---

**64. Aaron left at 9:15 to drive to his mountain cabin 108 miles away. He drove on the freeway until 10:45, and then he drove on the mountain road. He arrived at 11:05. His speed on the freeway was three times his speed on the mountain road. Find Aaron's speed on the freeway and on the mountain road.**

---

**65. Marisol left Los Angeles at 2:30 to drive to Santa Barbara, a distance of 95 miles. The traffic was heavy until 3:20. She drove the rest of the way in very light traffic and arrived at 4:20. Her speed in heavy traffic was 40 miles per hour slower than her speed in light traffic. Find her speed in heavy traffic and in light traffic.**

**Solution**

heavy traffic 30 mph, light traffic 70 mph

---

**66. Lizette is training for a marathon. At 7:00, she left her house and ran until 8:15, then she walked until 11:15. She covered a total distance of 19 miles. Her running speed was five miles per hour faster than her walking speed. Find her running and walking speeds.**

---

## Exercises: Everyday Math

Instructions: For questions 67-70, answer the given everyday math word problems.

**67. As the treasurer of her daughter's Girl Scout troop, Laney collected money for some girls and adults to go to a 3-day camp. Each girl paid \$75 and each adult paid \$30. The total amount of money collected for camp was \$765. If the number of girls is three times the number of adults, how many girls and how many adults paid for camp?**

**Solution**

9 girls, 3 adults

---

**68. Laurie was completing the treasurer's report for her son's Boy Scout troop at the end of the school year. She didn't remember how many boys had paid the \$15 full-year registration fee and how many had paid the \$10 partial-year fee. She knew that the number of boys who paid for a full-year was**

ten more than the number who paid for a partial-year. If \$250 was collected for all the registrations, how many boys had paid the full-year fee and how many had paid the partial-year fee?

---

69. John left his house in Irvine at 8:35 am to drive to a meeting in Los Angeles, 45 miles away. He arrived at the meeting at 9:50. At 3:30 pm, he left the meeting and drove home. He arrived home at 5:18.

- a. What was his average speed on the drive from Irvine to Los Angeles?
- b. What was his average speed on the drive from Los Angeles to Irvine?
- c. What was the total time he spent driving to and from this meeting?
- d. John drove a total of 90 miles roundtrip. Find his average speed. (Round to the nearest tenth.)

**Solution**

- a. 36 mph
  - b. 25 mph
  - c. 3.05 hours
  - d. 29.5 mph
- 

70. Sarah wants to arrive at her friend's wedding at 3:00. The distance from Sarah's house to the wedding is 95 miles. Based on usual traffic patterns, Sarah predicts she can drive the first 15 miles at 60 miles per hour, the next 10 miles at 30 miles per hour, and the remainder of the drive at 70 miles per hour.

- a. How long will it take Sarah to drive the first 15 miles?
  - b. How long will it take Sarah to drive the next 10 miles?
  - c. How long will it take Sarah to drive the rest of the trip?
  - d. What time should Sarah leave her house?
-

## Exercises: Writing Exercises

Instructions: For questions 71-76, answer the given writing exercises.

**71. Suppose you have six quarters, nine dimes, and four pennies. Explain how you find the total value of all the coins.**

**Solution**

Answers will vary.

---

**72. Do you find it helpful to use a table when solving coin problems? Why or why not?**

---

**73. In the table used to solve coin problems, one column is labeled “number” and another column is labeled “value.” What is the difference between the “number” and the “value?”**

**Solution**

Answers will vary.

---

**74. What similarities and differences did you see between solving the coin problems and the ticket and stamp problems?**

---

**75. When solving a uniform motion problem, how does drawing a diagram of the situation help you?**

**Solution**

Answers will vary.

---

**76. When solving a uniform motion problem, how does creating a table help you?**

# EXERCISES: GRAPH LINEAR EQUATIONS IN TWO VARIABLES (3.9)

## Exercises: Plot Points in a Rectangular Coordinate System

Instructions: For questions 1-8, plot each point in a rectangular coordinate system and identify the quadrant in which the point is located.

1.

- a.  $(-4, 2)$
- b.  $(-1, -2)$
- c.  $(3, -5)$
- d.  $(-3, 5)$
- e.  $\left(\frac{5}{3}, 2\right)$

**Solution**

Figure P3.9.1

2.

a.  $(-2, -3)$

b.  $(3, -3)$

c.  $(-4, 1)$

d.  $(4, -1)$

e.  $\left(\frac{3}{2}, 1\right)$

3.

a.  $(3, -1)$

b.  $(-3, 1)$

c.  $(-2, 2)$

d.  $(-4, -3)$

e.  $\left(1, \frac{14}{5}\right)$

**Solution**

Figure P3.9.2

4.

a.  $(-1, 1)$

b.  $(-2, -1)$

c.  $(2, 1)$

d.  $(1, -4)$

e.  $\left(3, \frac{7}{2}\right)$

5.

a.  $(-2, 0)$

b.  $(-3, 0)$

c.  $(0, 0)$

d.  $(0, 4)$

e.  $(0, 2)$

**Solution**

Figure 3P.9.3

6.

a.  $(0, 1)$

b.  $(0, -4)$

c.  $(-1, 0)$

d.  $(0, 0)$

e.  $(5, 0)$

7.

- a.  $(0, 0)$
- b.  $(0, -3)$
- c.  $(-4, 0)$
- d.  $(1, 0)$
- e.  $(0, -2)$

**Solution**

Figure 3P.9.4

8.

- a.  $(-3, 0)$
- b.  $(0, 5)$
- c.  $(0, -2)$
- d.  $(2, 0)$
- e.  $(0, 0)$

**Exercises: Name Ordered Pairs in a Rectangular**

## Coordinate System

Instructions: For questions 9-12, name the ordered pair of each point shown in the rectangular coordinate system.

9.

Figure 3P.9.5

### Solution

A:  $(-4, 1)$

B:  $(-3, -4)$

C:  $(1, -3)$

D:  $(4, 3)$

10.

Figure 3P.9.6

11.

Figure 3P.9.7

**Solution**A:  $(0, -2)$ B:  $(-2, 0)$ C:  $(0, 5)$ D:  $(5, 0)$ 

---

**12.**

Figure 3P.9.8

## Exercises: Verify Solutions to an Equation in Two Variables

Instructions: For questions 13-20, which ordered pairs are solutions to the given equations?

13.  $2x + y = 6$

a.  $(1, 4)$

b.  $(3, 0)$

c.  $(2, 3)$

**Solution**

a, b

14.  $x + 3y = 9$

a.  $(0, 3)$

b.  $(6, 1)$

c.  $(-3, -3)$

---

15.  $4x - 2y = 8$

a.  $(3, 2)$

b.  $(1, 4)$

c.  $(0, -4)$

**Solution**

a, c

---

16.  $3x - 2y = 12$

a.  $(4, 0)$

b.  $(2, -3)$

c.  $(1, 6)$

---

17.  $y = 4x + 3$

a.  $(4, 3)$

b.  $(-1, -1)$

c.  $\left(\frac{1}{2}, 5\right)$

**Solution**

b, c

---

18.  $y = 2x - 5$

a.  $(0, -5)$

**b.**  $(2, 1)$

**c.**  $\left(\frac{1}{2}, -4\right)$ 

---

**19.**  $y = \frac{1}{2}x - 1$

**a.**  $(2, 0)$

**b.**  $(-6, -4)$

**c.**  $(-4, -1)$

**Solution**a, b

---

**20.**  $y = \frac{1}{3}x + 1$

**a.**  $(-3, 0)$

**b.**  $(9, 4)$

**c.**  $(-6, -1)$ 

---

## Exercises: Complete a Table of Solutions to a Linear Equation

Instructions: For questions 21-32, complete the table to find solutions to each linear equation.

**21.**  $y = 2x - 4$

$x$	$y$	$(x, y)$
0		
2		
-1		

**Solution**

$x$	$y$	$(x, y)$
0	-4	$(0, -4)$
2	0	$(2, 0)$
-1	-6	$(-1, -6)$

---

22.  $y = 3x - 1$

$x$	$y$	$(x, y)$
0		
2		
-1		

---

23.  $y = -x + 5$

$x$	$y$	$(x, y)$
0		
3		
-2		

**Solution**

$x$	$y$	$(x, y)$
0	5	$(0, 5)$
3	2	$(3, 2)$
$-2$	7	$(-2, 7)$

---

24.  $y = -x + 2$

$x$	$y$	$(x, y)$
0		
3		
$-2$		

---

25.  $y = \frac{1}{3}x + 1$

$x$	$y$	$(x, y)$

	0	

**Solution**

$x$	$y$	$(x, y)$
0	2	(0, 2)
3	4	(3, 1)
6	0	(6, 0)

---

30.  $x + 2y = 8$

$x$	$y$	$(x, y)$
0		
4		
	0	

---

31.  $2x - 5y = 10$

$x$	$y$	$(x, y)$
0		
10		
	0	

**Solution**

$x$	$y$	$(x, y)$
0	-2	$(0, -2)$
10	2	$(10, 2)$
5	0	$(5, 0)$

32.  $3x - 4y = 12$

$x$	$y$	$(x, y)$
0		
8		
	0	

## Exercises: Find Solutions to a Linear Equation

Instructions: For questions 33-48, find three solutions to each linear equation.

33.  $y = 5x - 8$

**Solution**

Answers will vary.

---

34.  $y = 3x - 9$

---

35.  $y = -4x + 5$

**Solution**

Answers will vary.

---

36.  $y = -2x + 7$

---

37.  $x + y = 8$

**Solution**

Answers will vary.

---

38.  $x + y = 6$

---

39.  $x + y = -2$

**Solution**

Answers will vary.

---

40.  $x + y = -1$

---

41.  $3x + y = 5$

**Solution**

Answers will vary.

---

42.  $2x + y = 3$

---

43.  $4x - y = 8$

**Solution**

Answers will vary.

---

44.  $5x - y = 10$

---

45.  $2x + 4y = 8$

**Solution**

Answers will vary.

---

46.  $3x + 2y = 6$

---

47.  $5x - 2y = 10$

**Solution**

Answers will vary.

---

**48.**  $4x - 3y = 12$

---

### Exercises: Recognize the Relationship Between the Solutions of an Equation and its Graph

Instructions: For questions 49-52, for each ordered pair, decide:

- a. Is the ordered pair a solution to the equation?
- b. Is the point on the line?

**49.**  $y = x + 2$

- a.  $(0, 2)$
- b.  $(1, 2)$
- c.  $(-1, 1)$
- d.  $(-3, -1)$

Figure 3P.9.9

**Solution**

- a. yes; no
- b. no; no
- c. yes; yes
- d. yes; yes

- 
50.  $y = x - 4$
- a.  $(0, -4)$
  - b.  $(3, -1)$
  - c.  $(2, 2)$
  - d.  $(1, -5)$

Figure 3P.9.10

- 
51.  $y = \frac{1}{2}x - 3$
- a.  $(0, -3)$
  - b.  $(2, -2)$
  - c.  $(-2, -4)$
  - d.  $(4, 1)$

Figure 3P.9.11

**Solution**

- a. yes; yes
- b. yes; yes
- c. yes; yes
- d. no; no

---

52.  $y = \frac{1}{3}x + 2$

- a.  $(0, 2)$
- b.  $(3, 3)$
- c.  $(-3, 2)$
- d.  $(-6, 0)$

Figure 3P.9.12

## Exercises: Graph a Linear Equation by Plotting Points

Instructions: For questions 53-96, graph by plotting points.

53.  $y = 3x - 1$

**Solution**

Figure 3P.9.13

---

54.  $y = 2x + 3$

---

55.  $y = -2x + 2$

**Solution**

Figure 3P.9.14

---

56.  $y = -3x + 1$

---

57.  $y = x + 2$

**Solution**

Figure 3P.9.15

58.  $y = x - 3$

59.  $y = -x - 3$

**Solution**

Figure 3P.9.16

60.  $y = -x - 2$

---

61.  $y = 2x$

**Solution**

Figure 3P.9.17

---

62.  $y = 3x$

---

63.  $y = -4x$

**Solution**

Figure 3P.9.18

---

64.  $y = -2x$

---

65.  $y = \frac{1}{2}x + 2$

**Solution**

Figure 3P.9.19

66.  $y = \frac{1}{3}x - 1$

---

67.  $y = \frac{4}{3}x - 5$

**Solution**

Figure 3P.9.20

---

68.  $y = \frac{3}{2}x - 3$

---

69.  $y = -\frac{2}{5}x + 1$

**Solution**

Figure 3P.9.21

---

70.  $y = -\frac{4}{5}x - 1$

---

71.  $y = -\frac{3}{2}x + 2$

**Solution**

Figure 3P.9.22

72.  $y = -\frac{5}{3}x + 4$

---

73.  $x + y = 6$

**Solution**

Figure 3P.9.23

---

74.  $x + y = 4$

---

75.  $x + y = -3$

**Solution**

Figure 3P.9.24

---

76.  $x + y = -2$

---

77.  $x - y = 2$

**Solution**

Figure 3P.9.25

---

78.  $x - y = 1$

---

**79.**  $x - y = -1$

**Solution**

Figure 3P.9.26

**80.**  $x - y = -3$

**81.**  $3x + y = 7$

**Solution**

Figure 3P.9.27

**82.**  $5x + y = 6$

**83.**  $2x + y = -3$

**Solution**

Figure 3P.9.28

**84.**  $4x + y = -5$

**85.**  $\frac{1}{3}x + y = 2$

**Solution**

Figure 3P.9.29

---

86.  $\frac{1}{2}x + y = 3$

---

87.  $\frac{2}{5}x - y = 4$

**Solution**

Figure 3P.9.30

88.  $\frac{3}{4}x - y = 6$

---

89.  $2x + 3y = 12$

**Solution**

Figure 3P.9.31

---

90.  $4x + 2y = 12$

---

91.  $3x - 4y = 12$

**Solution**

Figure 3P.9.32

---

92.  $2x - 5y = 10$

---

93.  $x - 6y = 3$

**Solution**

Figure 3P.9.33

---

94.  $x - 4y = 2$

---

**95.**  $5x + 2y = 4$

**Solution**

Figure 3P.9.34

**96.**  $3x + 5y = 5$

## Exercises: Graph Vertical and Horizontal Lines

Instructions: For questions 97-108, graph each equation.

**97.**  $x = 4$

**Solution**

Figure 3P.9.35

---

98.  $x = 3$

---

99.  $x = -2$

**Solution**

Figure 3P.9.36

---

100.  $x = -5$

---

**101.**  $y = 3$

**Solution**

Figure 3P.9.37

**102.**  $y = 1$

**103.**  $y = -5$

**Solution**

Figure 3P.9.38

104.  $y = -2$

---

105.  $x = \frac{7}{3}$

**Solution**

Figure 3P.9.39

---

106.  $x = \frac{5}{4}$

---

107.  $y = -\frac{15}{4}$

**Solution**

Figure 3P.9.40

---

108.  $y = -\frac{5}{3}$

---

### Exercises: Graph a Pair of Equations in the Same Rectangular Coordinate System

Instructions: For questions 109-112, graph each pair of equations in the same rectangular coordinate system.

109.  $y = 2x$  and  $y = 2$

**Solution**

Figure 3P.9.41

---

**110.**  $y = 5x$  and  $y = 5$

---

**111.**  $y = -\frac{1}{2}x$  and  $y = -\frac{1}{2}$

**Solution**

Figure 3P.9.42

112.  $y = -\frac{1}{3}x$  and  $y = -\frac{1}{3}$

---

## Exercises: Mixed Practice

Instructions: For questions 113-128, graph each equation.

113.  $y = 4x$

**Solution**

Figure 3P.9.43

114.  $y = 2x$

---

115.  $y = -\frac{1}{2}x + 3$

**Solution**

Figure 3P.9.44

---

**116.**  $y = \frac{1}{4}x - 2$

---

**117.**  $y = -x$

**Solution**

Figure 3P.9.45

---

**118.**  $y = x$

---

**119.**  $x - y = 3$

**Solution**

Figure 3P.9.46

**120.**  $x + y = -5$

**121.**  $4x + y = 2$

**Solution**

Figure 3P.9.47

122.  $2x + y = 6$

---

123.  $y = -1$

**Solution**

Figure 3P.9.48

---

124.  $y = 5$

---

125.  $2x + 6y = 12$

**Solution**

Figure 3P.9.49

---

126.  $5x + 2y = 10$

---

127.  $x = 3$

**Solution**

Figure 3P.9.50

---

128.  $x = -4$

---

## Exercises: Identify the $x$ and $y$ -Intercepts on a Graph

Instructions: For questions 129-140, find the  $x$  and  $y$ -intercepts on each graph.

129.

Figure 3P.9.51

**Solution**

$(3, 0), (0, 3)$

---

130.

Figure 3P.9.52

131.

Figure 3P.9.53

**Solution**

$(5, 0)$ ,  $(0, -5)$

132.

Figure 3P.9.54

133.

Figure 3P.9.55

**Solution**

$(-2, 0), (0, -2)$

---

134.

Figure 3P.9.56

---

---

139.

Figure 3P.9.61

**Solution**

$(0, 0)$

---

**140.**

Figure 3P.9.62

---

### Exercises: Find the $x$ and $y$ -Intercepts from an Equation of a Line

Instructions: For questions 141-168, find the intercepts for each equation.

**141.**  $x + y = 4$

**Solution**

$(4, 0), (0, 4)$

**142.**  $x + y = 3$ 

---

**143.**  $x + y = -2$

**Solution**

$(-2, 0), (0, -2)$ 

---

**144.**  $x + y = -5$ 

---

**145.**  $x - y = 5$

**Solution**

$(5, 0), (0, -5)$ 

---

**146.**  $x - y = 1$ 

---

**147.**  $x - y = -3$

**Solution**

$(-3, 0), (0, 3)$ 

---

**148.**  $x - y = -4$ 

---

**149.**  $x + 2y = 8$

**Solution**

$(8, 0), (0, 4)$ 

---

**150.**  $x + 2y = 10$ 

---

**151.**  $3x + y = 6$

**Solution**

$(2, 0), (0, 6)$ 

---

**152.**  $3x + y = 9$ 

---

**153.**  $x - 3y = 12$

**Solution**

$(12, 0), (0, -4)$ 

---

**154.**  $x - 2y = 8$ 

---

**155.**  $4x - y = 8$

**Solution**

$(2, 0), (0, -8)$ 

---

**156.**  $5x - y = 5$ 

---

**157.**  $2x + 5y = 10$

**Solution**

$$(5, 0), (0, 2)$$

---

**158.**  $2x + 3y = 6$ 

---

**159.**  $3x - 2y = 12$

**Solution**

$$(4, 0), (0, -6)$$

---

**160.**  $3x - 5y = 30$ 

---

**161.**  $y = \frac{1}{3}x + 1$

**Solution**

$$(3, 0), (0, 1)$$

---

**162.**  $y = \frac{1}{4}x - 1$ 

---

**163.**  $y = \frac{1}{5}x + 2$

**Solution**

$$(-10, 0), (0, 2)$$

---

164.  $y = \frac{1}{3}x + 4$

---

165.  $y = 3x$

**Solution**

$(0, 0)$

---

166.  $y = -2x$

---

167.  $y = -4x$

**Solution**

$(0, 0)$

---

168.  $y = 5x$

---

## Exercises: Graph a Line Using the Intercepts

Instructions: For questions 169-194, graph using the intercepts.

169.  $-x + 5y = 10$

**Solution**

Figure 3P.9.63

---

**170.**  $-x + 4y = 8$

---

**171.**  $x + 2y = 4$

**Solution**

Figure 3P.9.64

---

**172.**  $x + 2y = 6$

---

**173.**  $x + y = 2$

**Solution**

Figure 3P.9.65

---

**174.**  $x + y = 5$

**175.**  $x + y = -3$

**Solution**

Figure 3P.9.66

176.  $x + y = -1$

---

177.  $x - y = 1$

**Solution**

Figure 3P.9.67

---

178.  $x - y = 2$

---

179.  $x - y = -4$

**Solution**

Figure 3P.9.68

---

**180.**  $x - y = -3$

---

**181.**  $4x + y = 4$

**Solution**

Figure 3P.9.69

---

**182.**  $3x + y = 3$

---

**183.**  $2x + 4y = 12$

**Solution**

Figure 3P.9.70

**184.**  $3x + 2y = 12$

**185.**  $3x - 2y = 6$

**Solution**

Figure 3P.9.71

**186.**  $5x - 2y = 10$ 

---

**187.**  $2x - 5y = -20$

**Solution**Figure 3P.9.72

---

**188.**  $3x - 4y = -12$ 

---

**189.**  $3x - y = -6$

**Solution**

Figure 3P.9.73

---

**190.**  $2x - y = -8$

---

**191.**  $y = -2x$

**Solution**

Figure 3P.9.74

---

**192.**  $y = -4x$

---

193.  $y = x$

**Solution**

Figure 3P.9.75

194.  $y = 3x$

## Exercises: Everyday Math

Instructions: For questions 195-200, answer the given everyday math word problems.

**195. Weight of a baby.** Mackenzie recorded her baby's weight every two months. The baby's age, in months, and weight, in pounds, are listed in the table below, and shown as an ordered pair in the third column.

a. Plot the points on a coordinate plane.

Figure 3P.9.76

**b. Why is only Quadrant I needed?**

Age $x$	Weight $y$	$(x, y)$
0	7	$(0, 7)$
2	11	$(2, 11)$
4	15	$(4, 15)$
6	16	$(6, 16)$
8	19	$(8, 19)$
10	20	$(10, 20)$
12	21	$(12, 21)$

**Solution**

a.

Figure 3P.9.77

b. Age and weight are only positive.

**196. Weight of a child.** Latresha recorded her son's height and weight every year. His height, in inches, and weight, in pounds, are listed in the table below, and shown as an ordered pair in the third column.

a. Plot the points on a coordinate plane.

Figure 3P.9.78

b. Why is only Quadrant I needed?

Height $x$	Weight $y$	$(x, y)$
28	22	$(28, 22)$
31	27	$(31, 27)$
33	33	$(33, 33)$
37	35	$(37, 35)$
40	41	$(40, 41)$
42	45	$(42, 45)$

**197. Motor home cost.** The Robinsons rented a motor home for one week to go on vacation. It cost them \$594 plus \$0.32 per mile to rent the motor home, so the linear equation  $y = 594 + 0.32x$  gives the cost,  $y$ , for driving  $x$  miles. Calculate the rental cost for driving 400, 800, and 1200 miles, and then graph the line.

**Solution**

\$722, \$850, \$978

Figure 3P.9.79

**198. Weekly earnings.** At the art gallery where he works, Salvador gets paid \$200 per week plus 15% of the sales he makes, so the equation  $y = 200 + 0.15x$  gives the amount,  $y$ , he earns for selling  $x$

dollars of artwork. Calculate the amount Salvador earns for selling \$900, \$1600, and \$2000, and then graph the line.

**199. Road trip.** Damien is driving from Chicago to Denver, a distance of 1000 miles. The  $x$ -axis on the graph below shows the time in hours since Damien left Chicago. The  $y$ -axis represents the distance he has left to drive.

Figure 3P.9.80

- Find the  $x$  and  $y$ -intercepts.
- Explain what the  $x$  and  $y$ -intercepts mean for Damien.

**Solution**

- $(0, 1000), (15, 0)$
- At  $(0, 1000)$ , he has been gone 0 hours and has 1000 miles left. At  $(15, 0)$ , he has been gone 15 hours and has 0 miles left to go.

**200. Road trip.** Ozzie filled up the gas tank of his truck and headed out on a road trip. The  $x$ -axis on the graph below shows the number of miles Ozzie drove since filling up. The  $y$ -axis represents the number of gallons of gas in the truck's gas tank.

Figure 3P.9.81

- a. Find the  $x$  and  $y$ -intercepts.
  - b. Explain what the  $x$  and  $y$ -intercepts mean for Ozzie.
- 

## Exercises: Writing Exercises

Instructions: For questions 201-210,

**201. Explain in words how you plot the point  $(4, -2)$  in a rectangular coordinate system.**

**Solution**

Answers will vary.

---

**202. How do you determine if an ordered pair is a solution to a given equation?**

---

**203. Is the point  $(-3, 0)$  on the  $x$ -axis or  $y$ -axis? How do you know?**

**Solution**

Answers will vary.

---

**204. Is the point  $(0, 8)$  on the  $x$ -axis or  $y$ -axis? How do you know?**

---

**205. Explain how you would choose three  $x$ -values to make a table to graph the line  $y = \frac{1}{5}x - 2$ .**

**Solution**

Answers will vary.

---

**206. What is the difference between the equations of a vertical and a horizontal line?**

---

**207. How do you find the  $x$ -intercept of the graph of  $3x - 2y = 6$ ?**

**Solution**

Answers will vary.

---

**208. Do you prefer to use the method of plotting points or the method using the intercepts to graph the equation  $4x + y = -4$ ? Why?**

---

**209. Do you prefer to use the method of plotting points or the method using the intercepts to graph the equation  $y = \frac{2}{3}x - 2$ ? Why?**

**Solution**

Answers will vary.

---

**210. Do you prefer to use the method of plotting points or the method using the intercepts to graph the equation  $y = 6$ ? Why?**

# EXERCISES: SLOPE OF A LINE (3.10)

---

## Exercises: Use \_\_\_\_\_ to find the Slope of a Line from its Graph

Instructions: For questions 1-16, find the slope of each line shown.

1.

Figure 3P.10.1

**Solution**

$$\frac{2}{5}$$

## Exercises: Find the Slope of Horizontal and Vertical Lines

Instructions: For questions 17-24, find the slope of each line.

17.  $y = 3$

**Solution**

0

---

18.  $y = 1$

---

19.  $x = 4$

**Solution**

undefined

---

20.  $x = 2$

---

21.  $y = -2$

**Solution**

0

---

22.  $y = -3$

---

23.  $x = -5$

**Solution**

undefined

---

24.  $x = -4$

---

**Exercises: Use the Slope Formula to find the Slope of a**

## Line between Two Points

Instructions: For questions 25-36, use the slope formula to find the slope of the line between each pair of points.

25.  $(1, 4)$  ,  $(3, 9)$

**Solution**

$$\frac{5}{2}$$

---

26.  $(2, 3)$  ,  $(5, 7)$

27.  $(0, 3)$  ,  $(4, 6)$

**Solution**

$$\frac{3}{4}$$

---

28.  $(0, 1)$  ,  $(5, 4)$

29.  $(2, 5)$  ,  $(4, 0)$

**Solution**

$$-\frac{5}{2}$$

---

30.  $(3, 6), (8, 0)$

---

31.  $(-3, 3), (4, -5)$

**Solution**

$$-\frac{8}{7}$$

---

32.  $(-2, 4), (3, -1)$

---

33.  $(-1, -2), (2, 5)$

**Solution**

$$\frac{7}{3}$$

---

34.  $(-2, -1), (6, 5)$

---

35.  $(4, -5), (1, -2)$

**Solution**

$$-1$$

---

36.  $(3, -6), (2, -2)$

---

## Exercises: Graph a Line Given a Point and the Slope

Instructions: For questions 37-52, graph each line with the given point and slope.

37.  $(1, -2); m = \frac{3}{4}$

**Solution**

Figure 3P.10.17

---

38.  $(1, -1); m = \frac{2}{3}$

---

39.  $(2, 5); m = -\frac{1}{3}$

**Solution**

Figure 3P.10.18

---

40.  $(1, 4); m = -\frac{1}{2}$

---

41.  $(-3, 4); m = -\frac{3}{2}$

**Solution**

Figure 3P.10.19

---

42.  $(-2, 5); m = -\frac{5}{4}$

---

43.  $(-1, -4); m = \frac{4}{3}$

**Solution**

Figure 3P.10.20

---

44.  $(-3, -5); m = \frac{3}{2}$

---

45.  $y$ -intercept 3;  $m = -\frac{2}{5}$

**Solution**

Figure 3P.10.21

---

46.  $y$ -intercept 5;  $m = -\frac{4}{3}$

---

47.  $x$ -intercept  $-2$ ;  $m = \frac{3}{4}$

**Solution**

Figure 3P.10.22

---

48.  $x$ -intercept  $-1$ ;  $m = \frac{1}{5}$

---

49.  $(-3, 3)$ ;  $m = 2$

**Solution**

Figure 3P.10.23

---

50.  $(-4, 2); m = 4$

---

51.  $(1, 5); m = -3$

**Solution**

Figure 3P.10.24

52.  $(2, 3); m = -1$

### Exercises: Recognize the Relation Between the Graph and the Slope–Intercept Form of an Equation of a Line

Instructions: For questions 53–58, use the graph to find the slope and  $y$ -intercept of each line. Compare the values to the equation  $y = mx + b$ .

53.  $y = 4x - 2$

Figure 3P.10.25

**Solution**

slope  $m = 4$  and  $y$ -intercept  $(0, -2)$

54.  $y = 3x - 5$

Figure 3P.10.26

55.  $y = -3x + 1$

Figure 3P.10.27

**Solution**

slope  $m = -3$  and  $y$ -intercept  $(0, 1)$

---

56.  $y = -x + 4$

Figure 3P.10.28

---

57.  $y = -\frac{2}{5}x + 3$

Figure 3P.10.29

**Solution**

slope  $m = -\frac{2}{5}$  and  $y$ -intercept  $(0, 3)$

---

58.  $y = -\frac{4}{3}x + 1$

Figure 3P.10.30

---

### Exercises: Identify the Slope and $y$ -Intercept From an Equation of a Line

Instructions: For questions 59-68, identify the slope and  $y$ -intercept of each line.

59.  $y = -9x + 7$

**Solution**

$-9; (0, 7)$

---

60.  $y = -7x + 3$

---

**61.**  $y = 4x - 10$

**Solution**

$4; (0, -10)$ 

---

**62.**  $y = 6x - 8$ 

---

**63.**  $4x + y = 8$

**Solution**

$-4; (0, 8)$ 

---

**64.**  $3x + y = 5$ 

---

**65.**  $8x + 3y = 12$

**Solution**

$-\frac{8}{3}; (0, 4)$ 

---

**66.**  $6x + 4y = 12$ 

---

**67.**  $7x - 3y = 9$

**Solution**

$\frac{7}{3}; (0, -3)$ 

---

**68.**  $5x - 2y = 6$

### Exercises: Graph a Line Using Its Slope and Intercept

Instructions: For questions 69-84, graph the line of each equation using its slope and y-intercept.

**69.**  $y = x + 4$

**Solution**

Figure 3P.10.31

**70.**  $y = x + 3$

**71.**  $y = 2x - 3$

**Solution**

Figure 3P.10.32

---

72.  $y = 3x - 1$

---

73.  $y = -x + 3$

**Solution**

Figure 3P.10.33

---

74.  $y = -x + 2$

---

75.  $y = -x - 2$

**Solution**

Figure 3P.10.34

---

76.  $y = -x - 4$

77.  $y = -\frac{2}{5}x - 3$

**Solution**

Figure 3P.10.35

---

$$78. y = -\frac{3}{4}x - 1$$

---

$$79. y = -\frac{2}{3}x + 1$$

**Solution**

Figure 3P.10.36

---

$$80. y = -\frac{3}{5}x + 2$$

---

$$81. 4x - 3y = 6$$

**Solution**

Figure 3P.10.37

---

82.  $3x - 4y = 8$

---

83.  $y = 0.3x + 25$

**Solution**

Figure 3P.10.38

---

84.  $y = 0.1x + 15$

---

## Exercises: Choose the Most Convenient Method to Graph a Line

Instructions: For questions 85-100, determine the most convenient method to graph each line.

**85.**  $y = 4$

**Solution**

horizontal line

---

**86.**  $x = 2$

---

**87.**  $x = -3$

**Solution**

vertical line

---

**88.**  $y = 5$

---

**89.**  $y = -5x + 2$

**Solution**

slope-intercept

---

90.  $y = -3x + 4$

---

91.  $x - y = 1$

**Solution**

intercepts

---

92.  $x - y = 5$

---

93.  $y = \frac{4}{5}x - 3$

**Solution**

slope-intercept

---

94.  $y = \frac{2}{3}x - 1$

---

95.  $y = -1$

**Solution**

horizontal line

---

96.  $y = -3$

---

$$97. 2x - 5y = -10$$

**Solution**

intercepts

---

$$98. 3x - 2y = -12$$

---

$$99. y = -\frac{1}{3}x + 5$$

**Solution**

slope-intercept

---

$$100. y = -\frac{1}{4}x + 3$$

---

## Exercises: Graph and Interpret Applications of Slope-Intercept

Instructions: For questions 101-108, graph and interpret each application of slope-intercept.

**101.** The equation  $P = 28 + 2.54w$  models the relation between the amount of Randy's monthly water bill payment,  $P$ , in dollars, and the number of units of water,  $w$ , used.

- a. Find the payment for a month when Randy used 0 units of water.
- b. Find the payment for a month when Randy used 15 units of water.

c. Interpret the slope and  $P$ -intercept of the equation.

d. Graph the equation.

**Solution**

a. \$28

b. \$66.10

c. The slope, 2.54, means that Randy's payment,  $P$ , increases by \$2.54 when the number of units of water he used,  $w$ , increases by 1. The  $P$ -intercept means that if the number units of water Randy used was 0, the payment would be \$28.

d.

Figure 3P.10.39

102. The equation  $P = 31 + 1.75w$  models the relation between the amount of Tuyen's monthly water bill payment,  $P$ , in dollars, and the number of units of water,  $w$ , used.

- Find Tuyen's payment for a month when 0 units of water are used.
- Find Tuyen's payment for a month when 12 units of water are used.
- Interpret the slope and  $P$ -intercept of the equation.
- Graph the equation.

103. Janelle is planning to rent a car while on vacation. The equation  $C = 0.32m + 15$  models the relation between the cost in dollars,  $C$ , per day and the number of miles,  $m$ , she drives in one day.

- Find the cost if Janelle drives the car 0 miles one day.
- Find the cost on a day when Janelle drives the car 400 miles.
- Interpret the slope and  $C$ -intercept of the equation.
- Graph the equation.

**Solution**

- \$15
- \$143
- The slope, 0.32, means that the cost,  $C$ , increases by \$0.32 when the number of miles driven,  $m$ , increases by 1. The  $C$ -intercept means that if Janelle drives 0 miles one day, the cost would be \$15.
- 

Figure 3P.10.40

- 
- 104. Bruce drives his car for his job. The equation  $R = 0.575m + 42$  models the relation between the amount in dollars,  $R$ , that he is reimbursed and the number of miles,  $m$ , he drives in one day.**
- Find the amount Bruce is reimbursed on a day when he drives 0 miles.
  - Find the amount Bruce is reimbursed on a day when he drives 220 miles.
  - Interpret the slope and  $R$ -intercept of the equation.
  - Graph the equation.
- 

- 105. Patel's weekly salary includes a base pay plus commission on his sales. The equation**

$S = 750 + 0.09c$  models the relation between his weekly salary,  $S$ , in dollars and the amount of his sales,  $c$ , in dollars.

- Find Patel's salary for a week when his sales were \$0.
- Find Patel's salary for a week when his sales were \$18,540.
- Interpret the slope and  $S$ -intercept of the equation.
- Graph the equation.

**Solution**

- \$750
- \$2418.60
- The slope, 0.09, means that Patel's salary,  $S$ , increases by \$0.09 for every \$1 increase in his sales. The  $S$ -intercept means that when his sales are \$0, his salary is \$750.
- 

Figure 3P.10.41

**106.** Cherie works in retail and her weekly salary includes commission for the amount she sells. The equation  $S = 400 + 0.15c$  models the relation between her weekly salary,  $S$ , in dollars and the amount of her sales,  $c$ , in dollars.

- Find Cherie's salary for a week when her sales were \$0.
- Find Cherie's salary for a week when her sales were \$3600.
- Interpret the slope and  $S$ -intercept of the equation.
- Graph the equation.

107. Margie is planning a dinner banquet. The equation  $C = 750 + 42g$  models the relation between the cost in dollars,  $C$ , of the banquet and the number of guests,  $g$ .

- Find the cost if the number of guests is 50.
- Find the cost if the number of guests is 100.
- Interpret the slope and  $C$ -intercept of the equation.
- Graph the equation.

**Solution**

- \$2850
- \$4950
- The slope, 42, means that the cost,  $C$ , increases by \$42 for when the number of guests increases by 1. The  $C$ -intercept means that when the number of guests is 0, the cost would be \$750.
- 

Figure 3P.10.42

---

108. Costa is planning a lunch banquet. The equation  $C = 450 + 28g$  models the relation between the cost in dollars,  $C$ , of the banquet and the number of guests,  $g$ .

- Find the cost if the number of guests is 40.
  - Find the cost if the number of guests is 80.
  - Interpret the slope and  $C$ -intercept of the equation.
  - Graph the equation.
-

## Exercises: Use Slopes to Identify Parallel Lines

Instructions: For questions 109-134, use slopes and  $y$ -intercepts to determine if the lines are parallel.

109.  $y = \frac{2}{3}x - 1$ ;  $2x - 3y = -2$

**Solution**

parallel

---

110.  $y = \frac{3}{4}x - 3$ ;  $3x - 4y = -2$

**Solution**

parallel

---

111.  $3x - 4y = -2$ ;  $y = \frac{3}{4}x - 3$

**Solution**

parallel

---

112.  $2x - 5y = -3$ ;  $y = \frac{2}{5}x + 1$

**Solution**

not parallel

---

113.  $6x - 3y = 9$ ;  $2x - y = 3$

114.  $2x - 4y = 6$ ;  $x - 2y = 3$

---

115.  $8x + 6y = 6$ ;  $12x + 9y = 12$

**Solution**

parallel

---

116.  $4x + 2y = 6$ ;  $6x + 3y = 3$

---

117.  $x = 7$ ;  $x = -8$

**Solution**

parallel

---

118.  $x = 5$ ;  $x = -6$

---

119.  $x = -3$ ;  $x = -2$

**Solution**

parallel

---

120.  $x = -4$ ;  $x = -1$

---

121.  $y = 5$ ;  $y = 1$

**Solution**

parallel

---

122.  $y = 2$ ;  $y = 6$

---

123.  $y = -1$ ;  $y = 2$

**Solution**

parallel

---

124.  $y = -4$ ;  $y = 3$

---

125.  $4x + 4y = 8$ ;  $x + y = 2$

**Solution**

not parallel

---

126.  $x - y = 2$ ;  $2x - 2y = 4$

---

127.  $5x - 2y = 11$ ;  $5x - y = 7$

**Solution**

not parallel

---

128.  $x - 3y = 6$ ;  $2x - 6y = 12$

---

129.  $4x - 8y = 16$ ;  $x - 2y = 4$

**Solution**

not parallel

---

130.  $3x - 6y = 12$ ;  $6x - 3y = 3$

---

131.  $x - 5y = 10$ ;  $5x - y = -10$

**Solution**

not parallel

---

132.  $9x - 3y = 6$ ;  $3x - y = 2$

---

133.  $9x - 5y = 4$ ;  $5x + 9y = -1$

**Solution**

not parallel

---

134.  $7x - 4y = 8$ ;  $4x + 7y = 14$

---

## Exercises: Use Slopes to Identify Perpendicular Lines

Instructions: For questions 135-146, use slopes and  $y$ -intercepts to determine if the lines are perpendicular.

**135.**  $x - 4y = 8$ ;  $4x + y = 2$

**Solution**

perpendicular

---

**136.**  $3x - 2y = 8$ ;  $2x + 3y = 6$

---

**137.**  $2x + 3y = 5$ ;  $3x - 2y = 7$

**Solution**

perpendicular

---

**138.**  $2x + 5y = 3$ ;  $5x - 2y = 6$

---

**139.**  $3x - 4y = 8$ ;  $4x - 3y = 6$

**Solution**

not perpendicular

---

**140.**  $3x - 2y = 1$ ;  $2x - 3y = 2$

---

**141.**  $2x + 4y = 3$ ;  $6x + 3y = 2$

**Solution**

not perpendicular

---

**142.**  $5x + 2y = 6$ ;  $2x + 5y = 8$

---

**143.**  $2x - 6y = 4$ ;  $12x + 4y = 9$

**Solution**

perpendicular

---

**144.**  $4x - 2y = 5$ ;  $3x + 6y = 8$

---

**145.**  $8x - 2y = 7$ ;  $3x + 12y = 9$

**Solution**

perpendicular

---

**146.**  $6x - 4y = 5$ ;  $8x + 12y = 3$

---

## Exercises: Everyday Math

Instructions: For questions 147-154, answer the given everyday math word problems.

**147. Slope of a roof.** An easy way to determine the slope of a roof is to set one end of a 12 inch level on the roof surface and hold it level. Then take a tape measure or ruler and measure from the other end of the level down to the roof surface. This will give you the slope of the roof. Builders, sometimes, refer to this as pitch and state it as an “ $x$  12 pitch” meaning  $\frac{x}{12}$ , where  $x$  is the measurement from the roof to the level—the rise. It is also sometimes stated as an “ $x$ -in-12 pitch”.

- What is the slope of the roof in this picture?
- What is the pitch in construction terms?

Figure 3P.10.43

### Solution

a.  $\frac{1}{3}$

b. 4 12 pitch or 4-in-12 pitch

**148.** The slope of the roof shown here is measured with a 12” level and a ruler. What is the slope of this roof?

Figure 3P.10.44

**149. Road grade.** A local road has a grade of 6%. The grade of a road is its slope expressed as a percent. Find the slope of the road as a fraction and then simplify. What rise and run would reflect this slope or grade?

**Solution**

$$\frac{3}{50}; \text{rise} = 3, \text{run} = 50$$

**150. Highway grade.** A local road rises 2 feet for every 50 feet of highway.

- What is the slope of the highway?
- The grade of a highway is its slope expressed as a percent. What is the grade of this highway?

**151. Wheelchair ramp.** The rules for wheelchair ramps require a maximum 1-inch rise for a 12-inch run.

- How long must the ramp be to accommodate a 24-inch rise to the door?
- Create a model of this ramp.

**Solution**

- 288 inches (24 feet)
- Models will vary.

**152. Wheelchair ramp.** A 1-inch rise for a 16-inch run makes it easier for the wheelchair rider to ascend a ramp.

- How long must a ramp be to easily accommodate a 24-inch rise to the door?
  - Create a model of this ramp.
- 

**153.** The equation  $n = 4T - 160$  is used to estimate the number of cricket chirps,  $n$ , in one minute based on the temperature in degrees Fahrenheit,  $T$ .

- Explain what the slope of the equation means.
- Explain what the  $n$ -intercept of the equation means. Is this a realistic situation?

**Solution**

- For every increase of one degree Fahrenheit, the number of chirps increases by four.
  - There would be  $-160$  chirps when the Fahrenheit temperature is  $0^\circ$ . (Notice that this does not make sense; this model cannot be used for all possible temperatures.)
- 

**154.** The equation  $C = \frac{5}{9}F - 17.8$  can be used to convert temperatures  $F$ , on the Fahrenheit scale to temperatures,  $C$ , on the Celsius scale.

- Explain what the slope of the equation means.
  - Explain what the  $C$ -intercept of the equation means.
- 

## Exercises: Writing Exercises

Instructions: For questions 155-158, answer the given writing exercises.

**155.** What does the sign of the slope tell you about a line?

**Solution**

When the slope is a positive number the line goes up from left to right. When the slope is a negative number the line goes down from left to right.

---

**156. How does the graph of a line with slope  $m = \frac{1}{2}$  differ from the graph of a line with slope  $m = 2$ ?**

---

**157. Why is the slope of a vertical line “undefined”?**

**Solution**

A vertical line has 0 run and since division by 0 is undefined the slope is undefined.

---

**158. Explain in your own words how to decide which method to use to graph a line.**

---

**159. Why are all horizontal lines parallel?**

**Solution**

Answers will vary.

# EXERCISES: FIND THE EQUATION OF A LINE (3.11)

---

## Exercises: Find an Equation of the Line Given the Slope and $y$ -Intercept

Instructions: For questions 1-16, find the equation of a line with given slope and  $y$ -intercept. Write the equation in slope-intercept form.

1. slope 3 and  $y$ -intercept  $(0, 5)$

---

2. slope 4 and  $y$ -intercept  $(0, 1)$

**Solution**

$$y = 4x + 1$$

---

3. slope 6 and  $y$ -intercept  $(0, -4)$

---

4. slope 8 and  $y$ -intercept  $(0, -6)$

**Solution**

$$y = 8x - 6$$

---

5. slope  $-1$  and  $y$ -intercept  $(0, 3)$

---

6. slope  $-1$  and  $y$ -intercept  $(0, 7)$

**Solution**

$$y = -x + 7$$

---

7. slope  $-2$  and  $y$ -intercept  $(0, -3)$

---

8. slope  $-3$  and  $y$ -intercept  $(0, -1)$

**Solution**

$$y = -3x - 1$$

---

9. slope  $\frac{3}{5}$  and  $y$ -intercept  $(0, -1)$

---

10. slope  $\frac{1}{5}$  and  $y$ -intercept  $(0, -5)$

**Solution**

$$y = \frac{1}{5}x - 5$$

---

11. slope  $-\frac{3}{4}$  and  $y$ -intercept  $(0, -2)$

---

**12. slope  $-\frac{2}{3}$  and  $y$ -intercept  $(0, -3)$**

**Solution**

$$y = -\frac{2}{3}x - 3$$

---

**13. slope 0 and  $y$ -intercept  $(0, -1)$**

---

**14. slope 0 and  $y$ -intercept  $(0, 2)$**

**Solution**

$$y = 2$$

---

**15. slope  $-3$  and  $y$ -intercept  $(0, 0)$**

---

**16. slope  $-4$  and  $y$ -intercept  $(0, 0)$**

**Solution**

$$y = -4x$$

---

## Exercises: Find the Equation of a Line Shown on a Graph

Instructions: For questions 17-24, find the equation of the line shown in each graph. Write the equation in slope-intercept form.

17.

Figure 3P.11.1

18.

Figure 3P.11.2

**Solution**

$$y = -2x + 4$$

---

**19.**

Figure 3P.11.3

20.

Figure 3P.11.4

**Solution**

$$y = \frac{3}{4}x + 2$$

---

**21.**

Figure 3P.11.5

**22.**

Figure 3P.11.6

**Solution**

$$y = -\frac{3}{2}x - 1$$

---

**23.**

Figure 3P.11.7

24.

Figure 3P.11.8

**Solution**

$$y = 6$$

---

### Exercises: Find an Equation of the Line Given the Slope and a Point

Instructions: For questions 25-42, find the equation of a line with given slope and containing the given point. Write the equation in slope-intercept form.

25.  $m = \frac{5}{8}$ , point  $(8, 3)$

---

26.  $m = \frac{3}{8}$ , point  $(8, 2)$

**Solution**

$$y = \frac{3}{8}x - 1$$

---

27.  $m = \frac{1}{6}$ , point  $(6, 1)$

---

28.  $m = \frac{5}{6}$ , point  $(6, 7)$

**Solution**

$$y = \frac{5}{6}x + 2$$

---

29.  $m = -\frac{3}{4}$ , point  $(8, -5)$

---

30.  $m = -\frac{3}{5}$ , point  $(10, -5)$

**Solution**

$$y = -\frac{3}{5}x + 1$$

---

31.  $m = -\frac{1}{4}$ , point  $(-12, -6)$

---

32.  $m = -\frac{1}{3}$ , point  $(-9, -8)$

**Solution**

$$y = -\frac{1}{3}x - 11$$

---

33. Horizontal line containing  $(-2, 5)$

---

34. Horizontal line containing  $(-1, 4)$

**Solution**

$$y = 4$$

---

**35. Horizontal line containing  $(-2, -3)$**

---

**36. Horizontal line containing  $(-1, -7)$**

**Solution**

$$y = -7$$

---

**37.  $m = -\frac{3}{2}$ , point  $(-4, -3)$**

---

**38.  $m = -\frac{5}{2}$ , point  $(-8, -2)$**

**Solution**

$$y = -\frac{5}{2}x - 22$$

---

**39.  $m = -7$ , point  $(-1, -3)$**

---

**40.  $m = -4$ , point  $(-2, -3)$**

**Solution**

$$y = -4x - 11$$

---

**41. Horizontal line containing  $(2, -3)$**

---

**42. Horizontal line containing  $(4, -8)$**

**Solution**

$$y = -8$$

---

### Exercises: Find an Equation of the Line Given Two Points

Instructions: For questions 43-68, find the equation of a line containing the given points. Write the equation in slope-intercept form.

**43.  $(2, 6)$  and  $(5, 3)$**

---

**44.  $(3, 1)$  and  $(2, 5)$**

**Solution**

$$y = -4x + 13$$

---

**45.  $(4, 3)$  and  $(8, 1)$**

---

**46.  $(2, 7)$  and  $(3, 8)$**

**Solution**

$$y = x + 5$$

---

47.  $(-3, -4)$  and  $(5, -2)$

---

48.  $(-5, -3)$  and  $(4, -6)$

**Solution**

$$y = -\frac{1}{3}x - \frac{14}{3}$$

---

49.  $(-1, 3)$  and  $(-6, -7)$

---

50.  $(-2, 8)$  and  $(-4, -6)$

**Solution**

$$y = 7x + 22$$

---

51.  $(6, -4)$  and  $(-2, 5)$

---

52.  $(3, -2)$  and  $(-4, 4)$

**Solution**

$$y = -\frac{6}{7}x + \frac{4}{7}$$

---

53.  $(0, 4)$  and  $(2, -3)$

---

54.  $(0, -2)$  and  $(-5, -3)$

**Solution**

$$y = \frac{1}{5}x - 2$$

---

55.  $(7, 2)$  and  $(7, -2)$

---

56.  $(4, 2)$  and  $(4, -3)$

**Solution**

$$x = 4$$

---

57.  $(-7, -1)$  and  $(-7, -4)$

---

58.  $(-2, 1)$  and  $(-2, -4)$

**Solution**

$$x = -2$$

---

59.  $(6, 1)$  and  $(0, 1)$

---

60.  $(6, 2)$  and  $(-3, 2)$

**Solution**

$$y = 2$$

---

61.  $(3, -4)$  and  $(5, -4)$

---

62.  $(-6, -3)$  and  $(-1, -3)$

**Solution**

$$y = -3$$

---

63.  $(4, 3)$  and  $(8, 0)$

---

64.  $(0, 0)$  and  $(1, 4)$

**Solution**

$$y = 4x$$

---

65.  $(-2, -3)$  and  $(-5, -6)$

---

66.  $(-3, 0)$  and  $(-7, -2)$

**Solution**

$$y = \frac{1}{2}x + \frac{3}{2}$$

---

67.  $(8, -1)$  and  $(8, -5)$

---

68.  $(3, 5)$  and  $(-7, 5)$

**Solution**

$$y = 5$$

---

### Exercises: Find an Equation of a Line Parallel to a Given Line

Instructions: For questions 69-84, find an equation of a line parallel to the given line and contains the given point. Write the equation in slope-intercept form.

69. line  $y = 4x + 2$ , point  $(1, 2)$

---

70. line  $y = 3x + 4$ , point  $(2, 5)$

**Solution**

$$y = 3x - 1$$

---

71. line  $y = -2x - 3$ , point  $(-1, 3)$

---

72. line  $y = -3x - 1$ , point  $(2, -3)$

**Solution**

$$y = -3x + 3$$

---

**73. line  $3x - y = 4$ , point  $(3, 1)$** 

---

**74. line  $2x - y = 6$ , point  $(3, 0)$** **Solution**

$$y = 2x - 6$$

---

**75. line  $4x + 3y = 6$ , point  $(0, -3)$** 

---

**76. line  $2x + 3y = 6$ , point  $(0, 5)$** **Solution**

$$y = -\frac{2}{3}x + 5$$

---

**77. line  $x = -3$ , point  $(-2, -1)$** 

---

**78. line  $x = -4$ , point  $(-3, -5)$** **Solution**

$$x = -3$$

---

**79. line  $x - 2 = 0$ , point  $(1, -2)$**

---

**80. line  $x - 6 = 0$ , point  $(4, -3)$**

**Solution**

$$x = 4$$

---

**81. line  $y = 5$ , point  $(2, -2)$**

---

**82. line  $y = 1$ , point  $(3, -4)$**

**Solution**

$$y = -4$$

---

**83. line  $y + 2 = 0$ , point  $(3, -3)$**

---

**84. line  $y + 7 = 0$ , point  $(1, -1)$**

**Solution**

$$y = -1$$

---

## Exercises: Find an Equation of a Line Perpendicular to a Given Line

Instructions: For questions 85-96, find an equation of a line perpendicular to the given line and contains the given point. Write the equation in slope-intercept form.

**85. line  $y = -2x + 3$ , point  $(2, 2)$**

---

**86. line  $y = -x + 5$ , point  $(3, 3)$**

**Solution**

$$y = x$$

---

**87. line  $y = \frac{3}{4}x - 2$ , point  $(-3, 4)$**

---

**88. line  $y = \frac{2}{3}x - 4$ , point  $(2, -4)$**

**Solution**

$$y = -\frac{3}{2}x - 1$$

---

**89. line  $2x - 3y = 8$ , point  $(4, -1)$**

---

**90. line  $4x - 3y = 5$ , point  $(-3, 2)$**

**Solution**

$$y = -\frac{3}{4}x - \frac{1}{4}$$

---

**91. line  $2x + 5y = 6$ , point  $(0, 0)$**

**92. line  $4x + 5y = -3$ , point  $(0, 0)$**

**Solution**

$$y = \frac{5}{4}x$$

---

**93. line  $y - 3 = 0$ , point  $(-2, -4)$**

**94. line  $y - 6 = 0$ , point  $(-5, -3)$**

**Solution**

$$x = -5$$

---

**95. line  $y$ -axis, point  $(3, 4)$**

**96. line  $y$ -axis, point  $(2, 1)$**

**Solution**

$$y = 1$$

---

## Exercises: Mixed Practice

Instructions: For questions 97-114, find the equation of each line. Write the equation in slope-intercept form.

97. Containing the points  $(4, 3)$  and  $(8, 1)$

---

98. Containing the points  $(2, 7)$  and  $(3, 8)$

**Solution**

$$y = x + 5$$

---

99.  $m = \frac{1}{6}$ , containing point  $(6, 1)$

---

100.  $m = \frac{5}{6}$ , containing point  $(6, 7)$

**Solution**

$$y = \frac{5}{6}x + 2$$

---

**101. Parallel to the line  $4x + 3y = 6$ , containing point  $(0, -3)$**

---

**102. Parallel to the line  $2x + 3y = 6$ , containing point  $(0, 5)$**

**Solution**

$$y = -\frac{2}{3}x + 5$$

---

**103.  $m = -\frac{3}{4}$ , containing point  $(8, -5)$**

---

**104.  $m = -\frac{3}{5}$ , containing point  $(10, -5)$**

**Solution**

$$y = -\frac{3}{5}x + 1$$

---

**105. Perpendicular to the line  $y - 1 = 0$ , point  $(-2, 6)$**

---

**106. Perpendicular to the line  $y$ -axis, point  $(-6, 2)$**

**Solution**

$$y = 2$$

---

**107. Containing the points  $(4, 3)$  and  $(8, 1)$**

---

**108. Containing the points  $(-2, 0)$  and  $(-3, -2)$**

**Solution**

$$y = x + 2$$

---

**109. Parallel to the line  $x = -3$ , containing point  $(-2, -1)$**

---

**110. Parallel to the line  $x = -4$ , containing point  $(-3, -5)$**

**Solution**

$$x = -3$$

---

**111. Containing the points  $(-3, -4)$  and  $(2, -5)$**

---

**112. Containing the points  $(-5, -3)$  and  $(4, -6)$**

**Solution**

$$y = -\frac{1}{3}x - \frac{14}{3}$$

---

**113. Perpendicular to the line  $x - 2y = 5$ , containing point  $(-2, 2)$**

---

**114. Perpendicular to the line  $4x + 3y = 1$ , containing point  $(0, 0)$**

**Solution**

$$y = \frac{3}{4}x$$

---

## Exercises: Everyday Math

Instructions: For questions 115-116, answer the given everyday math word problems.

**115. Cholesterol.** The age,  $x$ , and LDL cholesterol level,  $y$ , of two men are given by the points  $(18, 68)$  and  $(27, 122)$ . Find a linear equation that models the relationship between age and LDL cholesterol level.

---

**116. Fuel consumption.** The city mpg,  $x$ , and highway mpg,  $y$ , of two cars are given by the points  $(29, 40)$  and  $(19, 28)$ . Find a linear equation that models the relationship between city mpg and highway mpg.

**Solution**

$$y = 1.2x + 5.2$$

## Exercises: Writing Exercises

Instructions: For questions 117-118, answer the given writing exercises.

**117. Why are all horizontal lines parallel?**

---

**118. Explain in your own words why the slopes of two perpendicular lines must have opposite**

**signs.**

**Solution**

Answers will vary.

# EXERCISES: LINEAR FUNCTIONS AND APPLICATIONS OF LINEAR FUNCTIONS (3.12)

---

## Exercises: Verbal Problems

Instructions: For questions 1-7, answer the given verbal word problems.

**1. Terry is skiing down a steep hill. Terry's elevation,  $E(t)$ , in feet after  $t$  seconds is given by  $E(t) = 3000 - 70t$ . Write a complete sentence describing Terry's starting elevation and how it is changing over time.**

**Solution**

Terry starts at an elevation of 3000 feet and descends 70 feet per second.

---

**2. Jessica is walking home from a friend's house. After 2 minutes she is 1.4 miles from home. Twelve minutes after leaving, she is 0.9 miles from home. What is her rate in miles per hour?**

---

**3. A boat is 100 miles away from the marina, sailing directly toward it at 10 miles per hour. Write an equation for the distance of the boat from the marina after  $t$  hours.**

**Solution**

$$d(t) = 100 - 10t$$

---

**4. Explain how to find the output variable in a word problem that uses a linear function.**

---

**5. Explain how to find the input variable in a word problem that uses a linear function.**

**Solution**

Determine the independent variable. This is the variable upon which the output depends.

---

**6. Explain how to determine the slope in a word problem that uses a linear function.**

---

**7. Explain how to interpret the initial value in a word problem that uses a linear function.**

**Solution**

To determine the initial value, find the output when the input is equal to zero.

---

## Exercises: Algebraic Problems

Instructions: For questions 8-9, consider this scenario: A town's population has been decreasing at a constant rate. In 2010 the population was 5,900. By 2012 the population had dropped 4,700. Assume this trend continues.

**8. Predict the population in 2016.**

**Solution**

2,300

---

**9. Identify the year in which the population will reach 0.**

---

### Exercises: Algebraic Problems

Instructions: For questions 10-11, consider this scenario: A town's population has been increasing at a constant rate. In 2010 the population was **46,020**. By 2012 the population had increased to **52,070**. Assume this trend continues.

**10. Predict the population in 2016.**

**Solution**

64,170

---

**11. Identify the year in which the population will reach 75,000.**

---

### Exercises: Algebraic Problems

Instructions: For questions 12-17, consider this scenario: A town has an initial population of **75,000**. It grows at a constant rate of **2,500** per year for **5** years.

**12. Find the linear function that models the town's population  $P$  as a function of the year,  $t$ , where  $t$  is the number of years since the model began.**

**Solution**

$$P(t) = 75,000 + 2500t$$

---

**13. Find a reasonable domain and range for the function  $P$ .**

---

**14. If the function  $P$  is graphed, find and interpret the  $x$ - and  $y$ -intercepts.**

**Solution**

$(-30, 0)$  Thirty years before the start of this model, the town had no citizens.

$(0, 75,000)$  Initially, the town had a population of 75,000.

---

**15. If the function  $P$  is graphed, find and interpret the slope of the function.**

---

**16. When will the population reach 100,000?**

**Solution**

Ten years after the model began

---

**17. What is the population in the year 12 years from the onset of the model?**

---

## Exercises: Algebraic Problems

Instructions: For questions 18-23, consider this scenario: The weight of a newborn is **7.5** pounds. The baby gained one-half pound a month for its first year.

**18. Find the linear function that models the baby's weight  $W$  as a function of the age of the baby, in months,  $t$ .**

**Solution**

$$W(t) = 0.5t + 7.5$$

---

**19. Find a reasonable domain and range for the function  $W$ .**

---

**20. If the function  $W$  is graphed, find and interpret the  $x$ - and  $y$ -intercepts.**

**Solution**

$(-15, 0)$ : The  $x$ -intercept is not a plausible set of data for this model because it means the baby weighed 0 pounds 15 months prior to birth.  $(0, 7.5)$ : The baby weighed 7.5 pounds at birth.

---

**21. If the function  $W$  is graphed, find and interpret the slope of the function.**

---

**22. When did the baby weight 10.4 pounds?**

**Solution**

At age 5.8 months

---

23. What is the output when the input is 6.2?

---

## Exercises: Algebraic Problems

Instructions: For questions 24-29, consider this scenario: The number of people afflicted with the common cold in the winter months steadily decreased by **205** each year from 2005 until 2010. In 2005, **12,025** people were inflicted.

24. Find the linear function that models the number of people inflicted with the common cold  $C$  as a function of the year,  $t$ .

**Solution**

$$C(t) = 12,025 - 205t$$

---

25. Find a reasonable domain and range for the function  $C$ .

---

26. If the function  $C$  is graphed, find and interpret the  $x$ - and  $y$ -intercepts.

**Solution**

$(58.7, 0)$ : In roughly 59 years, the number of people inflicted with the common cold would be 0.

$(0, 12,025)$ : Initially there were 12,025 people afflicted by the common cold.

---

27. If the function  $C$  is graphed, find and interpret the slope of the function.

---

**28. When will the output reach 0?**

**Solution**

2063

**29. In what year will the number of people be 9,700?**

### Exercises: Graphical Problems

Instructions: For questions 30-33, use the graph in Figure 3P.12.1, which shows the profit,  $y$ , in thousands of dollars, of a company in a given year,  $t$ , where  $t$  represents the number of years since 1980.

Figure 3P.12.1

**30. Find the linear function  $y$ , where  $y$  depends on  $t$ , the number of years since 1980.**

**Solution**

$$y = -2t + 180$$

---

**31. Find and interpret the  $y$ -intercept.**

---

**32. Find and interpret the  $x$ -intercept.**

**Solution**

In 2070, the company's profit will be zero.

---

**33. Find and interpret the slope.**

---

## Exercises: Graphical Problems

Instructions: For questions 34-37, use the graph in Figure 3P.12.2, which shows the profit,  $y$ , in thousands of dollars, of a company in a given year,  $t$ , where  $t$  represents the number of years since 1980.

Figure 3P.12.2

**34. Find the linear function  $y$ , where  $y$  depends on  $t$ , the number of years since 1980.**

**Solution**

$$y = 30t - 300$$

---

**35. Find and interpret the  $y$ -intercept.**

**Solution**

$(0, -300)$  In 1980, the company lost \$300,000.

---

**36. Find and interpret the  $x$ -intercept.**

---

**37. Find and interpret the slope.****Solution**

$y = 30t - 300$  of form  $y = mx + b$ ,  $m = 30$ . For each year after 1980, the company's profits increased \$30,000 per year

## Exercises: Numeric Problems

Instructions: For questions 38-40, use the median home values in Mississippi and Hawaii (adjusted for inflation) shown in Table 3P.12.1. Assume that the house values are changing linearly.

**Table 3P.12.1: Median Home Values of Mississippi and Hawaii in 1950 and 2000**

Year	Mississippi	Hawaii
1950	\$25,200	\$74,400
2000	\$71,400	\$272,700

**38. In which state have home values increased at a higher rate?****39. If these trends were to continue, what would be the median home value in Mississippi in 2010?****Solution**

\$80,640

**40. If we assume the linear trend existed before 1950 and continues after 2000, the two states' median house values will be (or were) equal in what year? (The answer might be absurd.)**

## Exercises: Numeric

Instructions: For questions 41-43, use the median home values in Indiana and Alabama (adjusted for inflation) shown in [\(Figure\)](#). Assume that the house values are changing linearly.

**Table 3P.12.2: Median Home Values of Indiana and Alabama in 1950 and 2000**

Year	Indiana	Alabama
1950	\$37,700	\$27,100
2000	\$94,300	\$85,100

**41. In which state have home values increased at a higher rate?**

**Solution**

Alabama

---

**42. If these trends were to continue, what would be the median home value in Indiana in 2010?**

---

**43. If we assume the linear trend existed before 1950 and continues after 2000, the two states' median house values will be (or were) equal in what year? (The answer might be absurd.)**

**Solution**

2328

---

## Exercises: Real-World Applications

Instructions: For questions 44-66, solve the given real-world application problems.

**44. At noon, a barista notices that she has \$20 in her tip jar. If she makes an average of \$0.50 from each customer, how much will she have in her tip jar if she serves  $n$  more customers during her shift?**

**Solution**

$$20 + 0.5n$$

---

**45. A gym membership with two personal training sessions costs \$125, while gym membership with five personal training sessions costs \$260. What is cost per session?**

---

**46. A clothing business finds there is a linear relationship between the number of shirts,  $n$ , it can sell and the price,  $p$ , it can charge per shirt. In particular, historical data shows that 1,000 shirts can be sold at a price of \$30, while 3,000 shirts can be sold at a price of \$22. Find a linear equation in the form  $p(n) = mn + b$  that gives the price  $p$  they can charge for  $n$  shirts.**

**Solution**

$$p(n) = -0.004n + 34$$

---

**47. A phone company charges for service according to the formula:  $C(n) = 24 + 0.1n$ , where  $n$  is the number of minutes talked, and  $C(n)$  is the monthly charge, in dollars. Find and interpret the rate of change and initial value.**

---

**48. A farmer finds there is a linear relationship between the number of bean stalks,  $n$ , she plants**

and the yield,  $y$ , each plant produces. When she plants 30 stalks, each plant yields 30 oz of beans. When she plants 34 stalks, each plant produces 28 oz of beans. Find a linear relationship in the form  $y = mn + b$  that gives the yield when  $n$  stalks are planted.

**Solution**

$$y = -0.5n + 45$$

---

49. A city's population in the year 1960 was 287,500. In 1989 the population was 275,900. Compute the rate of growth of the population and make a statement about the population rate of change in people per year.

---

50. A town's population has been growing linearly. In 2003, the population was 45,000, and the population has been growing by 1,700 people each year. Write an equation,  $P(t)$ , for the population  $t$  years after 2003.

**Solution**

$$P(t) = 1700t + 45,000$$

---

51. Suppose that average annual income (in dollars) for the years 1990 through 1999 is given by the linear function:  $I(x) = 1054x + 23,286$ , where  $x$  is the number of years after 1990. Which of the following interprets the slope in the context of the problem?

- a. As of 1990, average annual income was \$23,286.
  - b. In the ten-year period from 1990–1999, average annual income increased by a total of \$1,054.
  - c. Each year in the decade of the 1990s, average annual income increased by \$1,054.
  - d. Average annual income rose to a level of \$23,286 by the end of 1999.
- 

52. When temperature is 0 degrees Celsius, the Fahrenheit temperature is 32. When the Celsius temperature is 100, the corresponding Fahrenheit temperature is 212. Express the Fahrenheit

temperature as a linear function of  $C$ , the Celsius temperature,  $F(C)$ .

- a. Find the rate of change of Fahrenheit temperature for each unit change temperature of Celsius.
- b. Find and interpret  $F(28)$ .
- c. Find and interpret  $F(-40)$ .

**Solution**

- a. Rate of change  $= \frac{\Delta F}{\Delta C} = \frac{212 - 32}{100 - 0} = 1.8$  degrees F for one degree change in C
  - b.  $F(28) = 1.8(28) + 32 = 82.4$  degrees F is 28 degrees C
  - c.  $F(-40) = 1.8(-40) + 32 = -40$  degrees F is -40 degrees C
- 

53. In 2004, a school population was 1001. By 2008 the population had grown to 1697. Assume the population is changing linearly.

- a. How much did the population grow between the year 2004 and 2008?
  - b. How long did it take the population to grow from 1001 students to 1697 students?
  - c. What is the average population growth per year?
  - d. What was the population in the year 2000?
  - e. Find an equation for the population,  $P$ , of the school  $t$  years after 2000.
  - f. Using your equation, predict the population of the school in 2011.
- 

54. In 2003, a town's population was 1431. By 2007 the population had grown to 2134. Assume the population is changing linearly.

- a. How much did the population grow between the year 2003 and 2007?
- b. How long did it take the population to grow from 1431 people to 2134 people?
- c. What is the average population growth per year?
- d. What was the population in the year 2000?
- e. Find an equation for the population,  $P$ , of the town  $t$  years after 2000.
- f. Using your equation, predict the population of the town in 2014.

**Solution**

a.  $2134 - 1431 = 703$  people

b.  $2007 - 2003 = 4$  years

c. Average rate of growth  $= \frac{703}{4} = 175.75$  people per year. So, using  $y = mx + b$ , we have

$$y = 175.75x + 1431.$$

d. The year 2000 corresponds to  $t = -3$ .

So,  $y = 175.75(-3) + 1431 = 903.75$  or roughly 904 people in year 2000

e. If the year 2000 corresponds to  $t = 0$ , then we have ordered pair  $(0, 903.75)$ .

$$y = 175.75x + 903.75 \text{ corresponds to } P(t) = 175.75t + 903.75.$$

f. The year 2014 corresponds to  $t = 14$ . Therefore,  $P(14) = 175.75(14) + 903.75 = 3364.25$ .

So, a population of 3364.

**55. A phone company has a monthly cellular plan where a customer pays a flat monthly fee and then a certain amount of money per minute used on the phone. If a customer uses 410 minutes, the monthly cost will be \$71.50. If the customer uses 720 minutes, the monthly cost will be \$118.**

- Find a linear equation for the monthly cost of the cell plan as a function of  $x$ , the number of monthly minutes used.
- Interpret the slope and  $y$ -intercept of the equation.
- Use your equation to find the total monthly cost if 687 minutes are used.

**56. A phone company has a monthly cellular data plan where a customer pays a flat monthly fee of \$10 and then a certain amount of money per megabyte (MB) of data used on the phone. If a customer uses 20 MB, the monthly cost will be \$11.20. If the customer uses 130 MB, the monthly cost will be \$17.80.**

- Find a linear equation for the monthly cost of the data plan as a function of  $x$ , the number of MB used.
- Interpret the slope and  $y$ -intercept of the equation.
- Use your equation to find the total monthly cost if 250 MB are used.

**Solution**

a.

Ordered pairs are  $(20, 11.20)$  and  $(130, 17.80)$

$$m = \frac{17.80 - 11.20}{130 - 20} = 0.06 \text{ and } b \text{ is at the point } (0, 10)$$

$$y = mx + b$$

$$y = 0.06x + 10$$

$$\text{or } C(x) = 0.06x + 10$$

b.

0.06 – For every MB, the client is charged 6 cents.

$(0, 10)$  – If no usage occurs, the client is charged \$10.

c.

$$\begin{aligned} C(250) &= 0.06(250) + 10 \\ &= \$25 \end{aligned}$$

**57. In 1991, the moose population in a park was measured to be 4,360. By 1999, the population was measured again to be 5,880. Assume the population continues to change linearly.**

**a. Find a formula for the moose population,  $P$  since 1990.**

**b. What does your model predict the moose population to be in 2003?**

**58. In 2003, the owl population in a park was measured to be 340. By 2007, the population was measured again to be 285. The population changes linearly. Let the input be years since 1990.**

**a. Find a formula for the owl population,  $P$ . Let the input be years since 2003.**

**b. What does your model predict the owl population to be in 2012?**

**Solution**

a.

Ordered pairs are  $(0, 340)$  and  $(4, 285)$

$$m = \frac{285 - 340}{4 - 0} = -13.75 \text{ and } b \text{ is at the point } (0, 340)$$

$$y = mx + b$$

$$y = -13.75x + 340$$

$$\text{or } P(t) = -13.75t + 340$$

b.

The year 2012 corresponds to  $t = 9$

$$\begin{aligned} P(9) &= -13.75(9) + 340 \\ &= 216.25 \text{ or } 216 \text{ owls} \end{aligned}$$

---

**59. The Federal Helium Reserve held about 16 billion cubic feet of helium in 2010 and is being depleted by about 2.1 billion cubic feet each year.**

- Give a linear equation for the remaining federal helium reserves,  $R$ , in terms of  $t$ , the number of years since 2010.
  - In 2015, what will the helium reserves be?
  - If the rate of depletion doesn't change, in what year will the Federal Helium Reserve be depleted?
- 

**60. Suppose the world's oil reserves in 2014 are 1,820 billion barrels. If, on average, the total reserves are decreasing by 25 billion barrels of oil each year:**

- Give a linear equation for the remaining oil reserves,  $R$ , in terms of  $t$ , the number of years since now.
- Seven years from now, what will the oil reserves be?
- If the rate at which the reserves are decreasing is constant, when will the world's oil reserves be depleted?

**Solution**

a.

The year 2014 corresponds to  $t = 0$ .

We have  $m = -25$  and  $b$  at the point  $(0, 1820)$

$$y = mx + b$$

$$y = -25x + 1820$$

$$\text{or } R(t) = -25t + 1820$$

b.

$$\begin{aligned} R(7) &= -25(7) + 1820 \\ &= 645 \text{ billion cubic feet} \end{aligned}$$

c.

$$\begin{aligned}
 0 &= -25t + 1820 \\
 -1820 &= -25t \\
 72.8 &= t \Rightarrow 2014 + 72.8 = 2086.8. \text{ So, in the year 2086}
 \end{aligned}$$

---

**61. You are choosing between two different prepaid cell phone plans. The first plan charges a rate of 26 cents per minute. The second plan charges a monthly fee of \$19.95 *plus* 11 cents per minute. How many minutes would you have to use in a month in order for the second plan to be preferable?**

---

**62. You are choosing between two different window washing companies. The first charges \$5 per window. The second charges a base fee of \$40 plus \$3 per window. How many windows would you need to have for the second company to be preferable?**

**Solution**

Plan 1:  $y = 5x$  where  $x$  is number of windows

Plan 2:  $y = 3x + 40$  where  $x$  is number of windows

$$3x + 40 \leq 5x$$

$$40 \leq 2x$$

$$20 \leq x$$

So, more than 20 windows

---

**63. When hired at a new job selling jewelry, you are given two pay options:**

**Option A: Base salary of \$17,000 a year with a commission of 12% of your sales**

**Option B: Base salary of \$20,000 a year with a commission of 5% of your sales**

**How much jewelry would you need to sell for option A to produce a larger income?**

---

**64. When hired at a new job selling electronics, you are given two pay options:**

**Option A:** Base salary of \$14,000 a year with a commission of 10% of your sales

**Option B:** Base salary of \$19,000 a year with a commission of 4% of your sales

How many electronics would you need to sell for option A to produce a larger income?

**Solution**

Option A:  $y = 0.10x + 14,000$  where  $x$  is dollars of sales.

Option B:  $y = 0.04x + 19,000$  where  $x$  is dollars of sales.

$$0.10x + 14,000 \geq 0.04x + 19,000$$

$$0.06x + 14,000 \geq 19,000$$

$$0.06x \geq 5,000$$

$$x \geq 83,333.33$$

So, more than \$83,333.33 in sales.

**65. When hired at a new job selling electronics, you are given two pay options:**

**Option A:** Base salary of \$20,000 a year with a commission of 12% of your sales

**Option B:** Base salary of \$26,000 a year with a commission of 3% of your sales

How many electronics would you need to sell for option A to produce a larger income?

**66. When hired at a new job selling electronics, you are given two pay options:**

**Option A:** Base salary of \$10,000 a year with a commission of 9% of your sales

**Option B:** Base salary of \$20,000 a year with a commission of 4% of your sales

How much electronics would you need to sell for option A to produce a larger income?

**Solution**

Option A:  $y = 0.09x + 10,000$  where  $x$  is dollars of sales.

Option B:  $y = 0.04x + 20,000$  where  $x$  is dollars of sales.

$$0.09x + 10,000 \geq 0.04x + 20,000$$

$$0.05x + 10,000 \geq 20,000$$

$$0.05x \geq 10,000$$

$$x \geq 200,000$$

So, more than \$200,000 in sales.

# EXERCISES: SOLVE SYSTEMS OF EQUATIONS BY GRAPHING (4.1)

---

## Exercises: Determine Whether an Ordered Pair is a Solution of a System of Equations

Instructions: For questions 1-8, determine if the following points are solutions to the given system of equations.

1. 
$$\begin{cases} 2x - 6y = 0 \\ 3x - 4y = 5 \end{cases}$$
  
a.  $(3, 1)$   
b.  $(-3, 4)$

**Solution**

a. yes

b. no

---

2. 
$$\begin{cases} 7x - 4y = -1 \\ -3x - 2y = 1 \end{cases}$$
  
a.  $(1, 2)$   
b.  $(1, -2)$

---

3. 
$$\begin{cases} 2x + y = 5 \\ x + y = 1 \end{cases}$$

a.  $(4, 3)$

b.  $(2, 0)$

**Solution**

a. yes

b. no

---

4. 
$$\begin{cases} -3x + y = 8 \\ -x + 2y = -9 \end{cases}$$

a.  $(-5, -7)$

b.  $(-5, 7)$

---

5. 
$$\begin{cases} x + y = 2 \\ y = \frac{3}{4}x \end{cases}$$

a.  $\left(\frac{8}{7}, \frac{6}{7}\right)$

b.  $\left(1, \frac{3}{4}\right)$

**Solution**

a. yes

b. no

---

6. 
$$\begin{cases} x + y = 1 \\ y = \frac{2}{5}x \end{cases}$$

a.  $\left(\frac{5}{7}, \frac{2}{7}\right)$

b.  $(5, 2)$

---

$$7. \begin{cases} x + 5y = 10 \\ y = \frac{3}{5}x + 1 \end{cases}$$

a.  $(-10, 4)$

b.  $\left(\frac{5}{4}, \frac{7}{4}\right)$

**Solution**

a. no

b. yes

---

$$8. \begin{cases} x + 3y = 9 \\ y = \frac{2}{3}x - 2 \end{cases}$$

a.  $(-6, 5)$

b.  $\left(5, \frac{4}{3}\right)$

---

## Exercises: Solve a System of Linear Equations by Graphing

Instructions: For questions 9-50, solve the following systems of equations by graphing.

$$9. \begin{cases} 3x + y = -3 \\ 2x + 3y = 5 \end{cases}$$

**Solution**

$(-2, 3)$

---

$$10. \begin{cases} -x + y = 2 \\ 2x + y = -4 \end{cases}$$

---

$$11. \begin{cases} -3x + y = -1 \\ 2x + y = 4 \end{cases}$$

**Solution**

$$(1, 2)$$

---

$$12. \begin{cases} -2x + 3y = -3 \\ x + y = 4 \end{cases}$$

---

$$13. \begin{cases} y = x + 2 \\ y = -2x + 2 \end{cases}$$

**Solution**

$$(0, 2)$$

---

$$14. \begin{cases} y = x - 2 \\ y = -3x + 2 \end{cases}$$

---

$$15. \begin{cases} y = \frac{3}{2}x + 1 \\ y = -\frac{1}{2}x + 5 \end{cases}$$

**Solution**

$$(2, 4)$$

---

$$16. \begin{cases} y = \frac{2}{3}x - 2 \\ y = -\frac{1}{3}x - 5 \end{cases}$$

---

$$17. \begin{cases} -x + y = -3 \\ 4x + 4y = 4 \end{cases}$$

**Solution**

$$(2, -1)$$

---

$$18. \begin{cases} x - y = 3 \\ 2x - y = 4 \end{cases}$$

---

$$19. \begin{cases} -3x + y = -1 \\ 2x + y = 4 \end{cases}$$

**Solution**

$$(1, 2)$$

---

$$20. \begin{cases} -3x + y = -2 \\ 4x - 2y = 6 \end{cases}$$

---

$$21. \begin{cases} x + y = 5 \\ 2x - y = 4 \end{cases}$$

**Solution**

$$(3, 2)$$

---

$$22. \begin{cases} x - y = 2 \\ 2x - y = 6 \end{cases}$$

---

$$23. \begin{cases} x + y = 2 \\ x - y = 0 \end{cases}$$

**Solution**

$$(1, 1)$$

---

$$24. \begin{cases} x + y = 6 \\ x - y = -8 \end{cases}$$

---

$$25. \begin{cases} x + y = -5 \\ x - y = 3 \end{cases}$$

**Solution**

$$(-1, -4)$$

---

$$26. \begin{cases} x + y = 4 \\ x - y = 0 \end{cases}$$

---

$$27. \begin{cases} x + y = -4 \\ -x + 2y = -2 \end{cases}$$

**Solution**

$$(3, 3)$$

---

$$28. \begin{cases} -x + 3y = 3 \\ x + 3y = 3 \end{cases}$$

---

$$29. \begin{cases} -2x + 3y = 3 \\ x + 3y = 12 \end{cases}$$

**Solution**

$$(-5, 6)$$

---

$$30. \begin{cases} 2x - y = 4 \\ 2x + 3y = 12 \end{cases}$$

---

$$31. \begin{cases} 2x + 3y = 6 \\ y = -2 \end{cases}$$

**Solution**

$$(6, -2)$$

---

$$32. \begin{cases} -2x + y = 2 \\ y = 4 \end{cases}$$

---

$$33. \begin{cases} x - 3y = -3 \\ y = 2 \end{cases}$$

**Solution**

$$(3, 2)$$

---

$$34. \begin{cases} 2x - 2y = 8 \\ y = -3 \end{cases}$$

---

$$35. \begin{cases} 2x - y = -1 \\ x = 1 \end{cases}$$

**Solution**

$(1, 3)$

---

$$36. \begin{cases} x + 2y = 2 \\ x = -2 \end{cases}$$

---

$$37. \begin{cases} x - 3y = -6 \\ x = -3 \end{cases}$$

**Solution**

$(-3, 1)$

---

$$38. \begin{cases} x + y = 4 \\ x = 1 \end{cases}$$

---

$$39. \begin{cases} 4x - 3y = 8 \\ 8x - 6y = 14 \end{cases}$$

**Solution**

no solution

---

$$40. \begin{cases} x + 3y = 4 \\ -2x - 6y = 3 \end{cases}$$

---

$$41. \begin{cases} -2x + 4y = 4 \\ y = \frac{1}{2}x \end{cases}$$

**Solution**

no solution

---

$$42. \begin{cases} 3x + 5y = 10 \\ y = -\frac{3}{5}x + 1 \end{cases}$$

---

$$43. \begin{cases} x = -3y + 4 \\ 2x + 6y = 8 \end{cases}$$

**Solution**

no solution

---

$$44. \begin{cases} 4x = 3y + 7 \\ 8x - 6y = 14 \end{cases}$$

---

$$45. \begin{cases} 2x + y = 6 \\ -8x - 4y = -24 \end{cases}$$

**Solution**

infinitely many solutions

---

$$46. \begin{cases} 5x + 2y = 7 \\ -10x - 4y = -14 \end{cases}$$

---

$$47. \begin{cases} x + 3y = -6 \\ 4y = -\frac{4}{3}x - 8 \end{cases}$$

**Solution**

infinitely many solutions

---

$$48. \begin{cases} -x + 2y = -6 \\ y = -\frac{1}{2}x - 1 \end{cases}$$

---

$$49. \begin{cases} -3x + 2y = -2 \\ y = -x + 4 \end{cases}$$

**Solution**

$(2, 2)$

---

$$50. \begin{cases} -x + 2y = -2 \\ y = -x - 1 \end{cases}$$

---

## Exercises: Determine the Number of Solutions of a Linear System

Instructions: For questions 51-62, determine the number of solutions and then classify the system of equations **without** graphing.

$$51. \begin{cases} y = \frac{2}{3}x + 1 \\ -2x + 3y = 5 \end{cases}$$

**Solution**

0 solutions

---

$$52. \begin{cases} y = \frac{1}{3}x + 2 \\ x - 3y = 9 \end{cases}$$

$$53. \begin{cases} y = -2x + 1 \\ 4x + 2y = 8 \end{cases}$$

**Solution**

0 solutions

---

$$54. \begin{cases} y = 3x + 4 \\ 9x - 3y = 18 \end{cases}$$

---

$$55. \begin{cases} y = \frac{2}{3}x + 1 \\ 2x - 3y = 7 \end{cases}$$

**Solution**

no solutions, inconsistent, independent

---

$$56. \begin{cases} 3x + 4y = 12 \\ y = -3x - 1 \end{cases}$$

$$57. \begin{cases} 4x + 2y = 10 \\ 4x - 2y = -6 \end{cases}$$

**Solution**

consistent, 1 solution

---

$$58. \begin{cases} 5x + 3y = 4 \\ 2x - 3y = 5 \end{cases}$$

$$59. \begin{cases} y = -\frac{1}{2}x + 5 \\ x + 2y = 10 \end{cases}$$

**Solution**

infinitely many solutions

---

$$60. \begin{cases} y = x + 1 \\ -x + y = 1 \end{cases}$$

---

$$61. \begin{cases} y = 2x + 3 \\ 2x - y = -3 \end{cases}$$

**Solution**

infinitely many solutions

---

$$62. \begin{cases} 5x - 2y = 10 \\ y = \frac{5}{2}x - 5 \end{cases}$$

---

## Exercises: Solve Applications of Systems of Equations by Graphing

Instructions: For questions 63–66, solve.

**63. Molly is making strawberry infused water. For each ounce of strawberry juice, she uses three times as many ounces of water. How many ounces of strawberry juice and how many ounces of water does she need to make 64 ounces of strawberry infused water?**

**Solution**

Molly needs 16 ounces of strawberry juice and 48 ounces of water.

---

**64. Jamal is making a snack mix that contains only pretzels and nuts. For every ounce of nuts, he will use 2 ounces of pretzels. How many ounces of pretzels and how many ounces of nuts does he need to make 45 ounces of snack mix?**

---

**65. Enrique is making a party mix that contains raisins and nuts. For each ounce of nuts, he uses twice the amount of raisins. How many ounces of nuts and how many ounces of raisins does he need to make 24 ounces of party mix?**

**Solution**

Enrique needs 8 ounces of nuts and 16 ounces of water.

---

**66. Owen is making lemonade from concentrate. The number of quarts of water he needs is 4 times the number of quarts of concentrate. How many quarts of water and how many quarts of concentrate does Owen need to make 100 quarts of lemonade?**

## Exercises: Everyday Math

Instructions: For questions 67-68, answer the given everyday math word problems.

**67. Leo is planning his spring flower garden. He wants to plant tulip and daffodil bulbs. He will plant 6 times as many daffodil bulbs as tulip bulbs. If he wants to plant 350 bulbs, how many tulip bulbs and how many daffodil bulbs should he plant?**

**Solution**

Leo should plant 50 tulips and 300 daffodils.

---

**68. A marketing company surveys 1,200 people. They surveyed twice as many females as males. How many males and females did they survey?**

---

## Exercises: Writing Exercises

Instructions: For questions 69-70, answer the given writing exercises.

**69. In a system of linear equations, the two equations have the same slope. Describe the possible solutions to the system.**

**Solution**

Given that it is only known that the slopes of both linear equations are the same, there are either no solutions (the graphs of the equations are parallel) or infinitely many.

---

**70. In a system of linear equations, the two equations have the same intercepts. Describe the possible solutions to the system.**

# EXERCISES: SOLVE SYSTEMS OF EQUATIONS BY SUBSTITUTION (4.2)

---

## Exercises: Solve a System of Equations by Substitution

Instructions: For questions 1-36, solve the systems of equations by substitution.

1. 
$$\begin{cases} 2x + y = -4 \\ 3x - 2y = -6 \end{cases}$$

**Solution**

$(-2, 0)$

---

2. 
$$\begin{cases} 2x + y = -2 \\ 3x - y = 7 \end{cases}$$

---

3. 
$$\begin{cases} x - 2y = -5 \\ 2x - 3y = -4 \end{cases}$$

**Solution**

$(7, 6)$

---

4. 
$$\begin{cases} x - 3y = -9 \\ 2x + 5y = 4 \end{cases}$$

---

$$5. \begin{cases} 5x - 2y = -6 \\ y = 3x + 3 \end{cases}$$

**Solution**

$$(0, 3)$$

---

$$6. \begin{cases} -2x + 2y = 6 \\ y = -3x + 1 \end{cases}$$

---

$$7. \begin{cases} 2x + 3y = 3 \\ y = -x + 3 \end{cases}$$

**Solution**

$$(6, -3)$$

---

$$8. \begin{cases} 2x + 5y = -14 \\ y = -2x + 2 \end{cases}$$

---

$$9. \begin{cases} 2x + 5y = 1 \\ y = \frac{1}{3}x - 2 \end{cases}$$

**Solution**

$$(3, -1)$$

---

$$10. \begin{cases} 3x + 4y = 1 \\ y = -\frac{2}{5}x + 2 \end{cases}$$

---

$$11. \begin{cases} 3x - 2y = 6 \\ y = \frac{2}{3}x + 2 \end{cases}$$

**Solution**

$(6, 6)$

---

$$12. \begin{cases} -3x - 5y = 3 \\ y = \frac{1}{2}x - 5 \end{cases}$$

$$13. \begin{cases} 2x + y = 10 \\ -x + y = -5 \end{cases}$$

**Solution**

$(5, 0)$

---

$$14. \begin{cases} -2x + y = 10 \\ -x + 2y = 16 \end{cases}$$

$$15. \begin{cases} 3x + y = 1 \\ -4x + y = 15 \end{cases}$$

**Solution**

$(-2, 7)$

---

$$16. \begin{cases} x + y = 0 \\ 2x + 3y = -4 \end{cases}$$

---

$$17. \begin{cases} x + 3y = 1 \\ 3x + 5y = -5 \end{cases}$$

**Solution**

$$(-5, 2)$$

---

$$18. \begin{cases} x + 2y = -1 \\ 2x + 3y = 1 \end{cases}$$

---

$$19. \begin{cases} 2x + y = 5 \\ x - 2y = -15 \end{cases}$$

**Solution**

$$(-1, 7)$$

---

$$20. \begin{cases} 4x + y = 10 \\ x - 2y = -20 \end{cases}$$

---

$$21. \begin{cases} y = -2x - 1 \\ y = -\frac{1}{3}x + 4 \end{cases}$$

**Solution**

$$(-3, 5)$$

---

$$22. \begin{cases} y = x - 6 \\ y = -\frac{3}{2}x + 4 \end{cases}$$

---

$$23. \begin{cases} y = 2x - 8 \\ y = \frac{3}{5}x + 6 \end{cases}$$

**Solution**

(10, 12)

---

$$24. \begin{cases} y = -x - 1 \\ y = x + 7 \end{cases}$$

---

$$25. \begin{cases} 4x + 2y = 8 \\ 8x - y = 1 \end{cases}$$

**Solution**

$\left(\frac{1}{2}, 3\right)$

---

$$26. \begin{cases} -x - 12y = -1 \\ 2x - 8y = -6 \end{cases}$$

---

$$27. \begin{cases} 15x + 2y = 6 \\ -5x + 2y = -4 \end{cases}$$

**Solution**

$\left(\frac{1}{2}, -\frac{3}{4}\right)$

---

$$28. \begin{cases} 2x - 15y = 7 \\ 12x + 2y = -4 \end{cases}$$

---

$$29. \begin{cases} y = 3x \\ 6x - 2y = 0 \end{cases}$$

**Solution**

Infinitely many solutions

---

$$30. \begin{cases} x = 2y \\ 4x - 8y = 0 \end{cases}$$

---

$$31. \begin{cases} 2x + 16y = 8 \\ -x - 8y = -4 \end{cases}$$

**Solution**

Infinitely many solutions

---

$$32. \begin{cases} 15x + 4y = 6 \\ -30x - 8y = -12 \end{cases}$$

---

$$33. \begin{cases} y = -4x \\ 4x + y = 1 \end{cases}$$

**Solution**

No solution

---

$$34. \begin{cases} y = -\frac{1}{4}x \\ x + 4y = 8 \end{cases}$$

---

$$35. \begin{cases} y = \frac{7}{8}x + 4 \\ -7x + 8y = 6 \end{cases}$$

**Solution**

No solution

---

$$36. \begin{cases} y = -\frac{2}{3}x + 5 \\ 2x + 3y = 11 \end{cases}$$

---

## Exercises: Solve Applications of Systems of Equations by Substitution

Instructions: For questions 37-51, translate to a system of equations and solve.

**37. The sum of two numbers is 15. One number is 3 less than the other. Find the numbers.**

**Solution**

The numbers are 6 and 9.

---

**38. The sum of two numbers is 30. One number is 4 less than the other. Find the numbers.**

---

**39. The sum of two numbers is  $-26$ . One number is 12 less than the other. Find the numbers.**

**Solution**

The numbers are  $-7$  and  $-19$ .

---

**40. The perimeter of a rectangle is 50. The length is 5 more than the width. Find the length and width.**

---

**41. The perimeter of a rectangle is 60. The length is 10 more than the width. Find the length and width.**

**Solution**

The length is 20 and the width is 10.

---

**42. The perimeter of a rectangle is 58. The length is 5 more than three times the width. Find the length and width.**

---

**43. The perimeter of a rectangle is 84. The length is 10 more than three times the width. Find the length and width.**

**Solution**

The length is 34 and the width is 8.

---

**44. The measure of one of the small angles of a right triangle is 14 more than 3 times the measure of the other small angle. Find the measure of both angles.**

---

**45. The measure of one of the small angles of a right triangle is 26 more than 3 times the measure of the other small angle. Find the measure of both angles.**

**Solution**

The measures are  $16^\circ$  and  $74^\circ$ .

---

**46. The measure of one of the small angles of a right triangle is 15 less than twice the measure of the other small angle. Find the measure of both angles.**

---

**47. The measure of one of the small angles of a right triangle is 45 less than twice the measure of the other small angle. Find the measure of both angles.**

**Solution**

The measures are  $45^\circ$  and  $45^\circ$ .

---

**48. Maxim has been offered positions by two car dealers. The first company pays a salary of \$10,000 plus a commission of \$1,000 for each car sold. The second pays a salary of \$20,000 plus a commission of \$500 for each car sold. How many cars would need to be sold to make the total pay the same?**

---

**49. Jackie has been offered positions by two cable companies. The first company pays a salary of 14,000 plus a commission of \$100 for each cable package sold. The second pays a salary of \$20,000 plus a commission of \$25 for each cable package sold. How many cable packages would need to be sold to make the total pay the same?**

**Solution**

80 cable packages would need to be sold.

---

50. Amara currently sells televisions for company. A at a salary of \$17,000 plus a \$100 commission for each television she sells. Company B offers her a position with a salary of \$29,000 plus a \$20 commission for each television she sells. How televisions would Amara need to sell for the options to be equal?

51. Mitchell currently sells stoves for company. A at a salary of \$12,000 plus a \$150 commission for each stove he sells. Company B offers him a position with a salary of \$24,000 plus a \$50 commission for each stove he sells. How many stoves would Mitchell need to sell for the options to be equal?

**Solution**

Mitchell would need to sell 120 stoves.

## Exercises: Everyday Math

Instructions: For questions 52-53, answer the given everyday math word problems.

52. When Gloria spent 15 minutes on the elliptical trainer and then did circuit training for 30 minutes, her fitness app says she burned 435 calories. When she spent 30 minutes on the elliptical trainer and 40 minutes circuit training she burned 690 calories. Solve the system

$$\begin{cases} 15e + 30c = 435 \\ 30e + 40c = 690 \end{cases} \text{ for } e, \text{ the number of calories she burns for each minute on the elliptical}$$

trainer, and  $c$ , the number of calories she burns for each minute of circuit training.

53. Stephanie left Riverside, California, driving her motorhome north on Interstate 15 towards Salt Lake City at a speed of 56 miles per hour. Half an hour later, Tina left Riverside in her car on the

same route as Stephanie, driving 70 miles per hour. Solve the system  $\begin{cases} 56s = 70t \\ s = t + \frac{1}{2} \end{cases}$ .

a. for  $t$  to find out how long it will take Tina to catch up to Stephanie.

**b. what is the value of  $s$ , the number of hours Stephanie will have driven before Tina catches up to her?**

**Solution**

a.  $t = 2$  hours

b.  $s = 2\frac{1}{2}$  hours

## Exercises: Writing Exercises

Instructions: For questions 54-55, answer the given writing exercises.

**54. Solve the system of equations** 
$$\begin{cases} x + y = 10 \\ x - y = 6 \end{cases}$$

**a. by graphing**

**b. by substitution**

**c. Which method do you prefer? Why?**

**55. Solve the system of equations** 
$$\begin{cases} 3x + y = 12 \\ x = y - 8 \end{cases}$$
 **by substitution and explain all your steps in words.**

**Solution**

Answers will vary.

# EXERCISES: SOLVE SYSTEMS OF EQUATIONS BY ELIMINATION (4.3)

---

## Exercises: Solve a System of Equations by Elimination

Instructions: For questions 1-41, solve the systems of equations by elimination.

1. 
$$\begin{cases} 5x + 2y = 2 \\ -3x - y = 0 \end{cases}$$

---

2. 
$$\begin{cases} -3x + y = -9 \\ x - 2y = -12 \end{cases}$$

**Solution**

$(6, 9)$

---

3. 
$$\begin{cases} 6x - 5y = -1 \\ 2x + y = 13 \end{cases}$$

---

4. 
$$\begin{cases} 3x - y = -7 \\ 4x + 2y = -6 \end{cases}$$

**Solution**

$(-2, 1)$

---

$$5. \begin{cases} x + y = -1 \\ x - y = -5 \end{cases}$$

---

$$6. \begin{cases} x + y = -8 \\ x - y = -6 \end{cases}$$

**Solution**

$$(-7, -1)$$

---

$$7. \begin{cases} 3x - 2y = 1 \\ -x + 2y = 9 \end{cases}$$

---

$$8. \begin{cases} -7x + 6y = -10 \\ x - 6y = 22 \end{cases}$$

**Solution**

$$(-2, -4)$$

---

$$9. \begin{cases} 3x + 2y = -3 \\ -x - 2y = -19 \end{cases}$$

---

$$10. \begin{cases} 5x + 2y = 1 \\ -5x - 4y = -7 \end{cases}$$

**Solution**

$$(-1, 3)$$

---

$$11. \begin{cases} 6x + 4y = -4 \\ -6x - 5y = 8 \end{cases}$$

---

$$12. \begin{cases} 3x - 4y = -11 \\ x - 2y = -5 \end{cases}$$

**Solution**

$$(-1, 2)$$

---

$$13. \begin{cases} 5x - 7y = 29 \\ x + 3y = -3 \end{cases}$$

---

$$14. \begin{cases} 6x - 5y = -75 \\ -x - 2y = -13 \end{cases}$$

**Solution**

$$(-5, 9)$$

---

$$15. \begin{cases} -x + 4y = 8 \\ 3x + 5y = 10 \end{cases}$$

---

$$16. \begin{cases} 2x - 5y = 7 \\ 3x - y = 17 \end{cases}$$

**Solution**

$$(6, 1)$$

---

$$17. \begin{cases} 5x - 3y = -1 \\ 2x - y = 2 \end{cases}$$

---

$$18. \begin{cases} 7x + y = -4 \\ 13x + 3y = 4 \end{cases}$$

**Solution**

$(-2, 10)$

---

$$19. \begin{cases} -3x + 5y = -13 \\ 2x + y = -26 \end{cases}$$

---

$$20. \begin{cases} 3x - 5y = -9 \\ 5x + 2y = 16 \end{cases}$$

**Solution**

$(2, 3)$

---

$$21. \begin{cases} 4x - 3y = 3 \\ 2x + 5y = -31 \end{cases}$$

---

$$22. \begin{cases} 4x + 7y = 14 \\ -2x + 3y = 32 \end{cases}$$

**Solution**

$(-7, 6)$

---

$$23. \begin{cases} 5x + 2y = 21 \\ 7x - 4y = 9 \end{cases}$$

---

$$24. \begin{cases} 3x + 8y = -3 \\ 2x + 5y = -3 \end{cases}$$

**Solution**

$$(-9, 3)$$

---

$$25. \begin{cases} 11x + 9y = -5 \\ 7x + 5y = -1 \end{cases}$$

---

$$26. \begin{cases} 3x + 8y = 67 \\ 5x + 3y = 60 \end{cases}$$

**Solution**

$$(9, 5)$$

---

$$27. \begin{cases} 2x + 9y = -4 \\ 3x + 13y = -7 \end{cases}$$

---

$$28. \begin{cases} \frac{1}{3}x - y = -3 \\ x + \frac{5}{2}y = 2 \end{cases}$$

**Solution**

$$(-3, 2)$$

---

$$29. \begin{cases} x + \frac{1}{2}y = \frac{3}{2} \\ \frac{1}{5}x - \frac{1}{5}y = 3 \end{cases}$$

---

$$30. \begin{cases} x + \frac{1}{3}y = -1 \\ \frac{1}{2}x - \frac{1}{3}y = -2 \end{cases}$$

**Solution**

$$(-2, 3)$$

---

$$31. \begin{cases} \frac{1}{3}x - y = -3 \\ \frac{2}{3}x + \frac{5}{2}y = 3 \end{cases}$$

---

$$32. \begin{cases} 2x + y = 3 \\ 6x + 3y = 9 \end{cases}$$

**Solution**

infinitely many solutions

---

$$33. \begin{cases} x - 4y = -1 \\ -3x + 12y = 3 \end{cases}$$

---

$$34. \begin{cases} -3x - y = 8 \\ 6x + 2y = -16 \end{cases}$$

**Solution**

infinitely many solutions

---

$$35. \begin{cases} 4x + 3y = 2 \\ 20x + 15y = 10 \end{cases}$$

---

$$36. \begin{cases} 3x + 2y = 6 \\ -6x - 4y = -12 \end{cases}$$

**Solution**

infinitely many solutions

---

$$37. \begin{cases} 5x - 8y = 12 \\ 10x - 16y = 20 \end{cases}$$

---

$$38. \begin{cases} -11x + 12y = 60 \\ -22x + 24y = 90 \end{cases}$$

**Solution**

inconsistent, no solution

---

$$39. \begin{cases} 7x - 9y = 16 \\ -21x + 27y = -24 \end{cases}$$

---

$$40. \begin{cases} 5x - 3y = 15 \\ y = \frac{5}{3}x - 2 \end{cases}$$

**Solution**

inconsistent, no solution

---

$$41. \begin{cases} 2x + 4y = 7 \\ y = -\frac{1}{2}x - 4 \end{cases}$$

---

## Exercises: Solve Applications of Systems of Equations by Elimination

Instructions: For questions 42-49, translate to a system of equations and solve.

**42. The sum of two numbers is 65. Their difference is 25. Find the numbers.**

**Solution**

The numbers are 20 and 45.

---

**43. The sum of two numbers is 37. Their difference is 9. Find the numbers.**

---

**44. The sum of two numbers is  $-27$ . Their difference is  $-59$ . Find the numbers.**

**Solution**

The numbers are 16 and  $-43$ .

---

**45. The sum of two numbers is  $-45$ . Their difference is  $-89$ . Find the numbers.**

---

**46. Andrea is buying some new shirts and sweaters. She is able to buy 3 shirts and 2 sweaters for**

**\$114 or she is able to buy 2 shirts and 4 sweaters for \$164. How much does a shirt cost? How much does a sweater cost?**

**Solution**

A shirt costs \$16 and a sweater costs \$33.

---

**47. Peter is buying office supplies. He is able to buy 3 packages of paper and 4 staplers for \$40 or he is able to buy 5 packages of paper and 6 staplers for \$62. How much does a package of paper cost? How much does a stapler cost?**

---

**48. The total amount of sodium in 2 hot dogs and 3 cups of cottage cheese is 4720 mg. The total amount of sodium in 5 hot dogs and 2 cups of cottage cheese is 6300 mg. How much sodium is in a hot dog? How much sodium is in a cup of cottage cheese?**

**Solution**

There are 860 mg in a hot dog. There are 1,000 mg in a cup of cottage cheese.

---

**49. The total number of calories in 2 hot dogs and 3 cups of cottage cheese is 960 calories. The total number of calories in 5 hot dogs and 2 cups of cottage cheese is 1190 calories. How many calories are in a hot dog? How many calories are in a cup of cottage cheese?**

---

## Exercises: Choose the Most Convenient Method to Solve a System of Linear Equations

Instructions: For questions 50-53, decide whether it would be more convenient to solve the system of equations by substitution or elimination.

50.

$$\begin{array}{l} \text{a.} \left\{ \begin{array}{l} 8x - 15y = -32 \\ 6x + 3y = -5 \end{array} \right. \\ \text{b.} \left\{ \begin{array}{l} x = 4y - 3 \\ 4x - 2y = -6 \end{array} \right. \end{array}$$

**Solution**

a. elimination

b. substitution

---

51.

$$\begin{array}{l} \text{a.} \left\{ \begin{array}{l} y = 7x - 5 \\ 3x - 2y = 16 \end{array} \right. \\ \text{b.} \left\{ \begin{array}{l} 12x - 5y = -42 \\ 3x + 7y = -15 \end{array} \right. \end{array}$$

---

52.

$$\begin{array}{l} \text{a.} \left\{ \begin{array}{l} y = 4x + 9 \\ 5x - 2y = -21 \end{array} \right. \\ \text{b.} \left\{ \begin{array}{l} 9x - 4y = 24 \\ 3x + 5y = -14 \end{array} \right. \end{array}$$

**Solution**

- a. substitution
  - b. elimination
- 

53.

$$\begin{array}{l} \text{a. } \left\{ \begin{array}{l} 14x - 15y = -30 \\ 7x + 2y = 10 \end{array} \right. \\ \text{b. } \left\{ \begin{array}{l} x = 9y - 11 \\ 2x - 7y = -27 \end{array} \right. \end{array}$$

---

## Exercises: Everyday Math

Instructions: For questions 54-55, answer the given everyday math word problems.

54. Norris can row 3 miles upstream against the current in the same amount of time it takes him to row 5 miles downstream, with the current. Solve the system.  $\begin{cases} r - c = 3 \\ r + c = 5 \end{cases}$
- a. for  $r$ , his rowing speed in still water.
  - b. Then solve for  $c$ , the speed of the river current.

**Solution**

- a.  $r = 4$
  - b.  $c = 1$
- 

55. Josie wants to make 10 pounds of trail mix using nuts and raisins, and she wants the total cost of the trail mix to be \$54. Nuts cost \$6 per pound and raisins cost \$3 per pound. Solve the system

$$\begin{cases} n + r = 10 \\ 6n + 3r = 54 \end{cases}$$
 to find  $n$ , the number of pounds of nuts, and  $r$ , the number of pounds of raisins she should use.

---

## Exercises: Writing Exercises

Instructions: For questions 56-57, answer the given writing exercises.

56. Solve the system 
$$\begin{cases} x + y = 10 \\ 5x + 8y = 56 \end{cases}$$
- by substitution
  - by graphing
  - Which method do you prefer? Why?

**Solution**

- $(8, 2)$
- 

Figure 4P.3.1

- Answers will vary.
-

57. Solve the system  $\begin{cases} x + y = -12 \\ y = 4 - \frac{1}{2}x \end{cases}$

a. by substitution

b. by graphing

c. Which method do you prefer? Why?

# EXERCISES: SOLVE APPLICATIONS WITH SYSTEMS OF EQUATIONS (4.4)

---

## Exercises: Translate to a System of Equations

Instructions: For questions 1-14, translate to a system of equations and solve the system.

**1. The sum of two numbers is fifteen. One number is three less than the other. Find the numbers.**

**Solution**

The numbers are 6 and 9.

---

**2. The sum of two numbers is twenty-five. One number is five less than the other. Find the numbers.**

---

**3. The sum of two numbers is negative thirty. One number is five times the other. Find the numbers.**

**Solution**

The numbers are  $-5$  and  $-25$ .

---

**4. The sum of two numbers is negative sixteen. One number is seven times the other. Find the numbers.**

---

**5. Twice a number plus three times a second number is twenty-two. Three times the first number plus four times the second is thirty-one. Find the numbers.**

**Solution**

The numbers are 5 and 4.

---

**6. Six times a number plus twice a second number is four. Twice the first number plus four times the second number is eighteen. Find the numbers.**

---

**7. Three times a number plus three times a second number is fifteen. Four times the first plus twice the second number is fourteen. Find the numbers.**

**Solution**

The numbers are 2 and 3.

---

**8. Twice a number plus three times a second number is negative one. The first number plus four times the second number is two. Find the numbers.**

---

**9. A married couple together earn \$75,000. The husband earns \$15,000 more than five times what his wife earns. What does the wife earn?**

**Solution**

\$10,000

---

**10. During two years in college, a student earned \$9,500. The second year she earned \$500 more than twice the amount she earned the first year. How much did she earn the first year?**

---

**11. Daniela invested a total of \$50,000, some in a certificate of deposit (CD) and the remainder in bonds. The amount invested in bonds was \$5000 more than twice the amount she put into the CD. How much did she invest in each account?**

**Solution**

She put \$15,000 into a CD and \$35,000 in bonds.

---

**12. Jorge invested \$28,000 into two accounts. The amount he put in his money market account was \$2,000 less than twice what he put into a CD. How much did he invest in each account?**

---

**13. In her last two years in college, Marlene received \$42,000 in loans. The first year she received a loan that was \$6,000 less than three times the amount of the second year's loan. What was the amount of her loan for each year?**

**Solution**

The amount of the first year's loan was \$30,000 and the amount of the second year's loan was \$12,000.

---

**14. Jen and David owe \$22,000 in loans for their two cars. The amount of the loan for Jen's car is \$2000 less than twice the amount of the loan for David's car. How much is each car loan?**

---

## Exercises: Solve Direct Translation Applications

Instructions: For questions 15-24, translate to a system of equations and solve.

**15. Alyssa is twelve years older than her sister, Bethany. The sum of their ages is forty-four. Find their ages.**

**Solution**

Bethany is 16 years old and Alyssa is 28 years old.

---

**16. Robert is 15 years older than his sister, Helen. The sum of their ages is sixty-three. Find their ages.**

---

**17. The age of Noelle's dad is six less than three times Noelle's age. The sum of their ages is seventy-four. Find their ages.**

**Solution**

Noelle is 20 years old and her dad is 54 years old.

---

**18. The age of Mark's dad is 4 less than twice Marks's age. The sum of their ages is ninety-five. Find their ages.**

---

**19. Two containers of gasoline hold a total of fifty gallons. The big container can hold ten gallons less than twice the small container. How many gallons does each container hold?**

**Solution**

The small container holds 20 gallons and the large container holds 30 gallons.

---

**20. June needs 48 gallons of punch for a party and has two different coolers to carry it in. The bigger cooler is five times as large as the smaller cooler. How many gallons can each cooler hold?**

---

**21. Shelly spent 10 minutes jogging and 20 minutes cycling and burned 300 calories. The next day,**

**Shelly swapped times, doing 20 minutes of jogging and 10 minutes of cycling and burned the same number of calories. How many calories were burned for each minute of jogging and how many for each minute of cycling?**

**Solution**

There were 10 calories burned jogging and 10 calories burned cycling.

---

**22. Drew burned 1800 calories Friday playing one hour of basketball and canoeing for two hours. Saturday he spent two hours playing basketball and three hours canoeing and burned 3200 calories. How many calories did he burn per hour when playing basketball?**

---

**23. Troy and Lisa were shopping for school supplies. Each purchased different quantities of the same notebook and thumb drive. Troy bought four notebooks and five thumb drives for \$116. Lisa bought two notebooks and three thumb drives for \$68. Find the cost of each notebook and each thumb drive.**

**Solution**

Notebooks are \$4 and thumb drives are \$20.

---

**24. Nancy bought seven pounds of oranges and three pounds of bananas for \$17. Her husband later bought three pounds of oranges and six pounds of bananas for \$12. What was the cost per pound of the oranges and the bananas?**

---

## Exercises: Solve Geometry Applications

Instructions: For questions 25-40, translate to a system of equations and solve.

**25. The difference of two complementary angles is 30 degrees. Find the measures of the angles.**

**Solution**

The measures are 60 degrees and 30 degrees.

---

**26. The difference of two complementary angles is 68 degrees. Find the measures of the angles.**

---

**27. The difference of two supplementary angles is 70 degrees. Find the measures of the angles.**

**Solution**

The measures are 125 degrees and 55 degrees.

---

**28. The difference of two supplementary angles is 24 degrees. Find the measure of the angles.**

---

**29. The difference of two supplementary angles is 8 degrees. Find the measures of the angles.**

**Solution**

94 degrees and 86 degrees

---

**30. The difference of two supplementary angles is 88 degrees. Find the measures of the angles.**

---

**31. The difference of two complementary angles is 55 degrees. Find the measures of the angles.**

**Solution**

72.5 degrees and 17.5 degrees

---

**32. The difference of two complementary angles is 17 degrees. Find the measures of the angles.**

---

**33. Two angles are supplementary. The measure of the larger angle is four more than three times the measure of the smaller angle. Find the measures of both angles.**

**Solution**

The measures are 44 degrees and 136 degrees.

---

**34. Two angles are supplementary. The measure of the larger angle is five less than four times the measure of the smaller angle. Find the measures of both angles.**

---

**35. Two angles are complementary. The measure of the larger angle is twelve less than twice the measure of the smaller angle. Find the measures of both angles.**

**Solution**

The measures are 34 degrees and 56 degrees.

---

**36. Two angles are complementary. The measure of the larger angle is ten more than four times the measure of the smaller angle. Find the measures of both angles.**

---

**37. Wayne is hanging a string of lights 45 feet long around the three sides of his rectangular patio,**

which is adjacent to his house. The length of his patio, the side along the house, is five feet longer than twice its width. Find the length and width of the patio.

**Solution**

The width is 10 feet and the length is 25 feet.

---

38. Darrin is hanging 200 feet of Christmas garland on the three sides of fencing that enclose his rectangular front yard. The length, the side along the house, is five feet less than three times the width. Find the length and width of the fencing.

---

39. A frame around a rectangular family portrait has a perimeter of 60 inches. The length is fifteen less than twice the width. Find the length and width of the frame.

**Solution**

The width is 15 feet and the length is 15 feet.

---

40. The perimeter of a rectangular toddler play area is 100 feet. The length is ten more than three times the width. Find the length and width of the play area.

---

## Exercises: Solve Uniform Motion Applications

Instructions: For questions 41-52, translate to a system of equations and solve.

41. Sarah left Minneapolis heading east on the interstate at a speed of 60 mph. Her sister followed

her on the same route, leaving two hours later and driving at a rate of 70 mph. How long will it take for Sarah's sister to catch up to Sarah?

**Solution**

It took Sarah's sister 12 hours.

---

42. College roommates John and David were driving home to the same town for the holidays. John drove 55 mph, and David, who left an hour later, drove 60 mph. How long will it take for David to catch up to John?

---

43. At the end of spring break, Lucy left the beach and drove back towards home, driving at a rate of 40 mph. Lucy's friend left the beach for home 30 minutes (half an hour) later, and drove 50 mph. How long did it take Lucy's friend to catch up to Lucy?

**Solution**

It took Lucy's friend 2 hours.

---

44. Felecia left her home to visit her daughter driving 45 mph. Her husband waited for the dog sitter to arrive and left home twenty minutes ( $\frac{1}{3}$  hour) later. He drove 55 mph to catch up to Felecia. How long before he reaches her?

---

45. The Jones family took a 12 mile canoe ride down the Indian River in two hours. After lunch, the return trip back up the river took three hours. Find the rate of the canoe in still water and the rate of the current.

**Solution**

The canoe rate is 5 mph and the current rate is 1 mph.

---

**46. A motor boat travels 60 miles down a river in three hours but takes five hours to return upstream. Find the rate of the boat in still water and the rate of the current.**

---

**47. A motor boat traveled 18 miles down a river in two hours but going back upstream, it took 4.5 hours due to the current. Find the rate of the motor boat in still water and the rate of the current. (Round to the nearest hundredth.).**

**Solution**

The boat rate is 6.5 mph and the current rate is 2.5 mph.

---

**48. A river cruise boat sailed 80 miles down the Mississippi River for four hours. It took five hours to return. Find the rate of the cruise boat in still water and the rate of the current. (Round to the nearest hundredth.).**

---

**49. A small jet can fly 1,072 miles in 4 hours with a tailwind but only 848 miles in 4 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.**

**Solution**

The jet rate is 240 mph and the wind speed is 28 mph.

---

**50. A small jet can fly 1,435 miles in 5 hours with a tailwind but only 1,215 miles in 5 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.**

---

**51. A commercial jet can fly 868 miles in 2 hours with a tailwind but only 792 miles in 2 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.**

**Solution**

The jet rate is 415 mph and the wind speed is 19 mph.

---

52. A commercial jet can fly 1,320 miles in 3 hours with a tailwind but only 1,170 miles in 3 hours into a headwind. Find the speed of the jet in still air and the speed of the wind.

---

## Exercises: Everyday Math

Instructions: For questions 53-54, answer the given everyday math word problems.

53. At a school concert, 425 tickets were sold. Student tickets cost \$5 each and adult tickets cost \$8 each. The total receipts for the concert were \$2,851.

Solve the system  $\begin{cases} s + a = 425 \\ 5s + 8a = 2,851 \end{cases}$  to find  $s$ , the number of student tickets and  $a$ , the number of adult tickets.

**Solution**

$$s = 183, a = 242$$

---

54. The first graders at one school went on a field trip to the zoo. The total number of children and adults who went on the field trip was 115. The number of adults was  $\frac{1}{4}$  the number of children.

Solve the system  $\begin{cases} c + a = 115 \\ a = \frac{1}{4}c \end{cases}$  to find  $c$ , the number of children and  $a$ , the number of adults.

---

## Exercises: Writing Exercises

Instructions: For questions 55-56, answer the given writing exercises.

**55. Write an application problem similar to [\(Example 4.4.3\)](#) using the ages of two of your friends or family members. Then translate to a system of equations and solve it.**

**Solution**

Answers will vary.

---

**56. Write a uniform motion problem similar to [\(Example 4.4.8\)](#) that relates to where you live with your friends or family members. Then translate to a system of equations and solve it.**

# EXERCISES: SOLVE MIXTURE APPLICATIONS WITH SYSTEMS OF EQUATIONS (4.5)

---

## Exercises: Solve Mixture Applications

Instructions: For questions 1-24, translate to a system of equations and solve.

**1. Tickets to a Broadway show cost \$35 for adults and \$15 for children. The total receipts for 1650 tickets at one performance were \$47,150. How many adult and how many child tickets were sold?**

**Solution**

There 1120 adult tickets and 530 child tickets sold.

---

**2. Tickets for a show are \$70 for adults and \$50 for children. One evening performance had a total of 300 tickets sold and the receipts totaled \$17,200. How many adult and how many child tickets were sold?**

---

**3. Tickets for a train cost \$10 for children and \$22 for adults. Josie paid \$1,200 for a total of 72 tickets. How many children's tickets and how many adult tickets did Josie buy?**

**Solution**

Josie bought 40 adult tickets and 32 children tickets.

---

**4. Tickets for a baseball game are \$69 for Main Level seats and \$39 for Terrace Level seats. A group of sixteen friends went to the game and spent a total of \$804 for the tickets. How many of Main Level and how many Terrace Level tickets did they buy?**

---

**5. Tickets for a dance recital cost \$15 for adults and \$7 for children. The dance company sold 253 tickets and the total receipts were \$2,771. How many adult tickets and how many child tickets were sold?**

**Solution**

There were 125 adult tickets and 128 children tickets sold.

---

**6. Tickets for the community fair cost \$12 for adults and \$5 dollars for children. On the first day of the fair, 312 tickets were sold for a total of \$2,204. How many adult tickets and how many child tickets were sold?**

---

**7. Brandon has a cup of quarters and dimes with a total value of \$3.80. The number of quarters is four less than twice the number of dimes. How many quarters and how many dimes does Brandon have?**

**Solution**

Brandon has 12 quarters and 8 dimes.

---

**8. Sherri saves nickels and dimes in a coin purse for her daughter. The total value of the coins in the purse is \$0.95. The number of nickels is two less than five times the number of dimes. How many nickels and how many dimes are in the coin purse?**

---

**9. Peter has been saving his loose change for several days. When he counted his quarters and dimes, he found they had a total value \$13.10. The number of quarters was fifteen more than three times**

**the number of dimes. How many quarters and how many dimes did Peter have?**

**Solution**

Peter had 11 dimes and 48 quarters.

---

**10. Lucinda had a pocketful of dimes and quarters with a value of ? \$6.20. The number of dimes is eighteen more than three times the number of quarters. How many dimes and how many quarters does Lucinda have?**

---

**11. A cashier has 30 bills, all of which are \$10 or \$20 bills. The total value of the money is \$460. How many of each type of bill does the cashier have?**

**Solution**

The cashier has fourteen \$10 bills and sixteen \$20 bills.

---

**12. A cashier has 54 bills, all of which are \$10 or \$20 bills. The total value of the money is \$910. How many of each type of bill does the cashier have?**

---

**13. Marissa wants to blend candy selling for \$1.80 per pound with candy costing \$1.20 per pound to get a mixture that costs her \$1.40 per pound to make. She wants to make 90 pounds of the candy blend. How many pounds of each type of candy should she use?**

**Solution**

Marissa should use 60 pounds of the \$1.20/lb candy and 30 pounds of the \$1.80/lb candy.

---

**14. How many pounds of nuts selling for \$6 per pound and raisins selling for \$3 per pound should Kurt combine to obtain 120 pounds of trail mix that cost him \$5 per pound?**

---

**15. Hannah has to make twenty-five gallons of punch for a potluck. The punch is made of soda and fruit drink. The cost of the soda is \$1.79 per gallon and the cost of the fruit drink is \$2.49 per gallon. Hannah's budget requires that the punch cost \$2.21 per gallon. How many gallons of soda and how many gallons of fruit drink does she need?**

**Solution**

Hannah needs 10 gallons of soda and 15 gallons of fruit drink.

---

**16. Joseph would like to make 12 pounds of a coffee blend at a cost of \$6.25 per pound. He blends Ground Chicory at \$4.40 a pound with Jamaican Blue Mountain at \$8.84 per pound. How much of each type of coffee should he use?**

---

**17. Julia and her husband own a coffee shop. They experimented with mixing a City Roast Columbian coffee that cost \$7.80 per pound with French Roast Columbian coffee that cost \$8.10 per pound to make a 20 pound blend. Their blend should cost them \$7.92 per pound. How much of each type of coffee should they buy?**

**Solution**

Julia and her husband should buy 12 pounds of City Roast Columbian coffee and 8 pounds of French Roast Columbian coffee.

---

**18. Melody wants to sell bags of mixed candy at her lemonade stand. She will mix chocolate pieces that cost \$4.89 per bag with peanut butter pieces that cost \$3.79 per bag to get a total of twenty-five bags of mixed candy. Melody wants the bags of mixed candy to cost her \$4.23 a bag to make. How many bags of chocolate pieces and how many bags of peanut butter pieces should she use?**

---

**19. Jotham needs 70 liters of a 50% alcohol solution. He has a 30% and an 80% solution available. How many liters of the 30% and how many liters of the 80% solutions should he mix to make the 50% solution?**

**Solution**

Jotham should mix 2 liters of the 30% solution and 28 liters of the 80% solution.

---

**20. Joy is preparing 15 liters of a 25% saline solution. She only has 40% and 10% solution in her lab. How many liters of the 40% and how many liters of the 10% should she mix to make the 25% solution?**

---

**21. A scientist needs 65 liters of a 15% alcohol solution. She has available a 25% and a 12% solution. How many liters of the 25% and how many liters of the 12% solutions should she mix to make the 15% solution?**

**Solution**

The scientist should mix 15 liters of the 25% solution and 50 liters of the 12% solution.

---

**22. A scientist needs 120 liters of a 20% acid solution for an experiment. The lab has available a 25% and a 10% solution. How many liters of the 25% and how many liters of the 10% solutions should the scientist mix to make the 20% solution?**

---

**23. A 40% antifreeze solution is to be mixed with a 70% antifreeze solution to get 240 liters of a 50% solution. How many liters of the 40% and how many liters of the 70% solutions will be used?**

**Solution**

160 liters of the 40% solution and 80 liters of the 70% solution will be used.

---

**24. A 90% antifreeze solution is to be mixed with a 75% antifreeze solution to get 360 liters of a 85% solution. How many liters of the 90% and how many liters of the 75% solutions will be used?**

---

## Exercises: Solve Interest Applications

Instructions: For questions 25-32, translate to a system of equations and solve.

**25. Hattie had \$3,000 to invest and wants to earn 10.6% interest per year. She will put some of the money into an account that earns 12% per year and the rest into an account that earns 10% per year. How much money should she put into each account?**

**Solution**

Hattie should invest \$900 at 12% and \$2,100 at 10%.

---

**26. Carol invested \$2,560 into two accounts. One account paid 8% interest and the other paid 6% interest. She earned 7.25% interest on the total investment. How much money did she put in each account?**

---

**27. Sam invested \$48,000, some at 6% interest and the rest at 10%. How much did he invest at each rate if he received \$4,000 in interest in one year?**

**Solution**

Sam invested \$28,000 at 10% and \$20,000 at 6%.

---

**28. Arnold invested \$64,000, some at 5.5% interest and the rest at 9%. How much did he invest at each rate if he received \$4,500 in interest in one year?**

---

**29. After four years in college, Josie owes \$65,800 in student loans. The interest rate on the federal**

loans is 4.5% and the rate on the private bank loans is 2%. The total interest she owed for one year was \$2,878.50. What is the amount of each loan?

**Solution**

The federal loan is \$62,500 and the bank loan is \$3,300.

---

30. Mark wants to invest \$10,000 to pay for his daughter's wedding next year. He will invest some of the money in a short term CD that pays 12% interest and the rest in a money market savings account that pays 5% interest. How much should he invest at each rate if he wants to earn \$1,095 in interest in one year?

---

31. A trust fund worth \$25,000 is invested in two different portfolios. This year, one portfolio is expected to earn 5.25% interest and the other is expected to earn 4%. Plans are for the total interest on the fund to be \$1,150 in one year. How much money should be invested at each rate?

**Solution**

\$12,000 should be invested at 5.25% and \$13,000 should be invested at 4%.

---

32. A business has two loans totaling \$85,000. One loan has a rate of 6% and the other has a rate of 4.5%. This year, the business expects to pay \$4,650 in interest on the two loans. How much is each loan?

---

## Exercises: Everyday Math

Instructions: For questions 33-34, translate to a system of equations and solve.

33. Laurie was completing the treasurer's report for her son's Boy Scout troop at the end of the school year. She didn't remember how many boys had paid the \$15 full-year registration fee and how many had paid the \$10 partial-year fee. She knew that the number of boys who paid for a full-year was ten more than the number who paid for a partial-year. If \$250 was collected for all the registrations, how many boys had paid the full-year fee and how many had paid the partial-year fee?

**Solution**

14 boys paid the full-year fee. 4 boys paid the partial-year fee,

---

34. As the treasurer of her daughter's Girl Scout troop, Laney collected money for some girls and adults to go to a three-day camp. Each girl paid \$75 and each adult paid \$30. The total amount of money collected for camp was \$765. If the number of girls is three times the number of adults, how many girls and how many adults paid for camp?

---

## Exercises: Writing Exercises

Instructions: For questions 35-36, answer the given writing exercises.

34. Take a handful of two types of coins, and write a problem similar to [\(Example 4.5.2\)](#) relating the total number of coins and their total value. Set up a system of equations to describe your situation and then solve it.

**Solution**

Answers will vary.

---

35. In [\(Example 4.5.6\)](#) we solved the system of equations

$$\begin{cases} b + f = 21,540 \\ 0.105b + 0.059f = 1669.68 \end{cases}$$

**by substitution. Would you have used substitution or elimination to solve this system? Why?**

# EXERCISES: ADD AND SUBTRACT POLYNOMIALS (5.1)

---

## Exercises: Identify Polynomials, Monomials, Binomials, and Trinomials

Instructions: For questions 1-4, determine if each of the following polynomials is a monomial, binomial, trinomial, or other polynomial.

1.

a.  $81b^5 - 24b^3 + 1$

b.  $5c^3 + 11c^2 - c - 8$

c.  $\frac{14}{15}y + \frac{1}{7}$

d.  $5$

e.  $4y + 17$

**Solution**

a. trinomial

b. polynomial

c. binomial

d. monomial

e. binomial

---

2.

a.  $x^2 - y^2$

b.  $-13c^4$

c.  $x^2 + 5x - 7$

d.  $x^2y^2 - 2xy + 8$

e. 19

3.

a.  $8 - 3x$

b.  $z^2 - 5z - 6$

c.  $y^3 - 8y^2 + 2y - 16$

d.  $81b^5 - 24b^3 + 1$

e.  $-18$

**Solution**

a. binomial

b. trinomial

c. polynomial

d. trinomial

e. monomial

4.

a.  $11y^2$

b.  $-73$

c.  $6x^2 - 3xy + 4x - 2y + y^2$

d.  $4y + 17$

e.  $5c^3 + 11c^2 - c - 8$

## Exercises: Determine the Degree of Polynomials

Instructions: For questions 5-8, determine the degree of each polynomial.

5.

a.  $6a^2 + 12a + 14$

b.  $18xy^2z$

c.  $5x + 2$

d.  $y^3 - 8y^2 + 2y - 16$

e.  $-24$

**Solution**

a. 2

b. 4

c. 1

d. 3

e. 0

---

6.

a.  $9y^3 - 10y^2 + 2y - 6$

b.  $-12p^4$

c.  $a^2 + 9a + 18$

d.  $20x^2y^2 - 10a^2b^2 + 30$

e. 17

---

7.

a.  $14 - 29x$

b.  $z^2 - 5z - 6$

c.  $y^3 - 8y^2 + 2y - 16$

d.  $23ab^2 - 14$

e.  $-3$

**Solution**

a. 1

b. 2

c. 3

d. 3

e. 0

8.

a.  $62y^2$

b. 15

c.  $6x^2 - 3xy + 4x - 2y + y^2$

d.  $10 - 9x$

e.  $m^4 + 4m^3 + 6m^2 + 4m + 1$

## Exercises: Add and Subtract Monomials

Instructions: For questions 9-32, add or subtract the monomials.

9.  $7x^2 + 5x^2$

**Solution**

$12x^2$

10.  $4y^3 + 6y^3$

11.  $-12w + 18w$

**Solution**

$6w$

12.  $-3m + 9m$

---

13.  $4a - 9a$

**Solution**

$-5a$

---

14.  $-y - 5y$

---

15.  $28x - (-12x)$

**Solution**

$40x$

---

16.  $13z - (-4z)$

---

17.  $-5b - 17b$

**Solution**

$-22b$

---

18.  $-10x - 35x$

---

19.  $12a + 5b - 22a$

**Solution**

$$-10a + 5b$$

---

$$20. 14x - 3y - 13x$$

---

$$21. 2a^2 + b^2 - 6a^2$$

**Solution**

$$-4a^2 + b^2$$

---

$$22. 5u^2 + 4v^2 - 6u^2$$

---

$$23. xy^2 - 5x - 5y^2$$

**Solution**

$$xy^2 - 5x - 5y^2$$

---

$$24. pq^2 - 4p - 3q^2$$

---

$$25. a^2b - 4a - 5ab^2$$

**Solution**

$$a^2b - 4a - 5ab^2$$

---

26.  $x^2y - 3x + 7xy^2$

---

27.  $12a + 8b$

**Solution**

$12a + 8b$

---

28.  $19y + 5z$

---

29. **Add:**  $4a, -3b, -8a$

**Solution**

$-4a - 3b$

---

30. **Add:**  $4x, 3y, -3x$

---

31. **Subtract**  $5x^6$  from  $-12x^6$ .

**Solution**

$-17x^6$

---

32. **Subtract**  $2p^4$  from  $-7p^4$ .

---

## Exercises: Add and Subtract Polynomials

Instructions: For questions 33-70, add or subtract the polynomials.

33.  $(5y^2 + 12y + 4) + (6y^2 - 8y + 7)$

**Solution**

$$11y^2 + 4y + 11$$

---

34.  $(4y^2 + 10y + 3) + (8y^2 - 6y + 5)$

---

35.  $(x^2 + 6x + 8) + (-4x^2 + 11x - 9)$

**Solution**

$$-3x^2 + 17x - 1$$

---

36.  $(y^2 + 9y + 4) + (-2y^2 - 5y - 1)$

---

37.  $(8x^2 - 5x + 2) + (3x^2 + 3)$

**Solution**

$$11x^2 - 5x + 5$$

---

38.  $(7x^2 - 9x + 2) + (6x^2 - 4)$

---

39.  $(5a^2 + 8) + (a^2 - 4a - 9)$

**Solution**

$6a^2 - 4a - 1$

---

40.  $(p^2 - 6p - 18) + (2p^2 + 11)$

---

41.  $(4m^2 - 6m - 3) - (2m^2 + m - 7)$

**Solution**

$2m^2 - 7m + 4$

---

42.  $(3b^2 - 4b + 1) - (5b^2 - b - 2)$

---

43.  $(a^2 + 8a + 5) - (a^2 - 3a + 2)$

**Solution**

$5a + 3$

---

44.  $(b^2 - 7b + 5) - (b^2 - 2b + 9)$

---

45.  $(12s^2 - 15s) - (s - 9)$

**Solution**

$$12s^2 - 16s + 9$$

---

46.  $(10r^2 - 20r) - (r - 8)$

47. Subtract  $(9x^2 + 2)$  from  $(12x^2 - x + 6)$ .

**Solution**

$$3x^2 - x + 4$$

---

48. Subtract  $(5y^2 - y + 12)$  from  $(10y^2 - 8y - 20)$ .

49. Subtract  $(7w^2 - 4w + 2)$  from  $(8w^2 - w + 6)$ .

**Solution**

$$w^2 + 3w + 4$$

---

50. Subtract  $(5x^2 - x + 12)$  from  $(9x^2 - 6x - 20)$ .

51. Find the sum of  $(2p^3 - 8)$  and  $(p^2 + 9p + 18)$ .

**Solution**

$$2p^3 + p^2 + 9p + 10$$

---

**52. Find the sum of  $(q^2 + 4q + 13)$  and  $(7q^3 - 3)$ .**

---

**53. Find the sum of  $(8a^3 - 8a)$  and  $(a^2 + 6a + 12)$ .**

**Solution**

$$8a^3 + a^2 - 2a + 12$$

---

**54. Find the sum of  $(b^2 + 5b + 13)$  and  $(4b^3 - 6)$ .**

---

**55. Find the difference of  $(w^2 + w - 42)$  and  $(w^2 - 10w + 24)$ .**

**Solution**

$$11w - 66$$

---

**56. Find the difference of  $(z^2 - 3z - 18)$  and  $(z^2 + 5z - 20)$ .**

---

**57. Find the difference of  $(c^2 + 4c - 33)$  and  $(c^2 - 8c + 12)$ .**

**Solution**

$$12c - 45$$

---

**58. Find the difference of  $(t^2 - 5t - 15)$  and  $(t^2 + 4t - 17)$ .**

---

$$59. (7x^2 - 2xy + 6y^2) + (3x^2 - 5xy)$$

**Solution**

$$10x^2 - 7xy + 6y^2$$

---

$$60. (-5x^2 - 4xy - 3y^2) + (2x^2 - 7xy)$$

---

$$61. (7m^2 + mn - 8n^2) + (3m^2 + 2mn)$$

**Solution**

$$10m^2 + 3mn - 8n^2$$

---

$$62. (2r^2 - 3rs - 2s^2) + (5r^2 - 3rs)$$

---

$$63. (a^2 - b^2) - (a^2 + 3ab - 4b^2)$$

**Solution**

$$-3ab + 3b^2$$

---

$$64. (m^2 + 2n^2) - (m^2 - 8mn - n^2)$$

---

$$65. (u^2 - v^2) - (u^2 - 4uv - 3v^2)$$

**Solution**

$$4uv + 2v^2$$

---

$$66. (j^2 - k^2) - (j^2 - 8jk - 5k^2)$$

---

$$67. (p^3 - 3p^2q) + (2pq^2 + 4q^3) - (3p^2q + pq^2)$$

**Solution**

$$p^3 - 6p^2q + pq^2 + 4q^3$$

---

$$68. (a^3 - 2a^2b) + (ab^2 + b^3) - (3a^2b + 4ab^2)$$

---

$$69. (x^3 - x^2y) - (4xy^2 - y^3) + (3x^2y - xy^2)$$

**Solution**

$$x^3 + 2x^2y - 5xy^2 + y^3$$

---

$$70. (x^3 - 2x^2y) - (xy^2 - 3y^3) - (x^2y - 4xy^2)$$

---

## Exercises: Evaluate a Polynomial for a Given Value

Instructions: For questions 71-78, evaluate each polynomial for the given value.

**71. Evaluate  $8y^2 - 3y + 2$  when:**

**a.  $y = 5$**

b.  $y = -2$

c.  $y = 0$

**Solution**

a. 187

b. 46

c. 2

---

**72. Evaluate  $5y^2 - y - 7$  when:**

a.  $y = -4$

b.  $y = 1$

c.  $y = 0$

---

**73. Evaluate  $4 - 36x$  when:**

a.  $x = 3$

b.  $x = 0$

c.  $x = -1$

**Solution**

a.  $-104$

b. 4

c. 40

---

**74. Evaluate  $16 - 36x^2$  when:**

a.  $x = -1$

b.  $x = 0$

c.  $x = 2$

---

**75. A painter drops a brush from a platform 75 feet high. The polynomial  $-16t^2 + 75$  gives the**

height of the brush  $t$  seconds after it was dropped. Find the height after  $t = 2$  seconds.

**Solution**

11

---

76. A girl drops a ball off a cliff into the ocean. The polynomial  $-16t^2 + 250$  gives the height of a ball  $t$  seconds after it is dropped from a 250-foot tall cliff. Find the height after  $t = 2$  seconds.

---

77. A manufacturer of stereo sound speakers has found that the revenue received from selling the speakers at a cost of  $p$  dollars each is given by the polynomial  $-4p^2 + 420p$ . Find the revenue received when  $p = 60$  dollars.

**Solution**

\$10,800

---

78. A manufacturer of the latest basketball shoes has found that the revenue received from selling the shoes at a cost of  $p$  dollars each is given by the polynomial  $-4p^2 + 420p$ . Find the revenue received when  $p = 90$  dollars.

## Exercises: Everyday Math

Instructions: For questions 79-83, answer the given everyday math word problems.

79. **Fuel Efficiency.** The fuel efficiency (in miles per gallon) of a car going at a speed of  $x$  miles per hour is given by the polynomial  $-\frac{1}{150}x^2 + \frac{1}{3}x$ . Find the fuel efficiency when  $x = 30$  mph.

**Solution**

4

---

**80. Stopping Distance.** The number of feet it takes for a car traveling at  $x$  miles per hour to stop on dry, level concrete is given by the polynomial  $0.06x^2 + 1.1x$ . Find the stopping distance when  $x = 40$  mph.

---

**81. Rental Cost.** The cost to rent a rug cleaner for  $d$  days is given by the polynomial  $5.50d + 25$ . Find the cost to rent the cleaner for 6 days.

**Solution**

\$58

---

**82. Height of Projectile.** The height (in feet) of an object projected upward is given by the polynomial  $-16t^2 + 60t + 90$  where  $t$  represents time in seconds. Find the height after  $t = 2.5$  seconds.

---

**83. Temperature Conversion.** The temperature in degrees Fahrenheit is given by the polynomial  $\frac{9}{5}c + 32$  where  $c$  represents the temperature in degrees Celsius. Find the temperature in degrees Fahrenheit when  $c = 65^\circ$ .

**Solution**

149° F

---

## Exercises: Writing Exercises

Instructions: For questions 84-87, answer the given writing exercises.

**84. Using your own words, explain the difference between a monomial, a binomial, and a trinomial.**

---

**85. Using your own words, explain the difference between a polynomial with five terms and a polynomial with a degree of 5.**

**Solution**

Answers will vary.

---

**86. Ariana thinks the sum  $6y^2 + 5y^4$  is  $11y^6$ . What is wrong with her reasoning?**

---

**87. Jonathan thinks that  $\frac{1}{3}$  and  $\frac{1}{x}$  are both monomials. What is wrong with his reasoning?**

**Solution**

Answers will vary.

# EXERCISES: USE MULTIPLICATION PROPERTIES OF EXPONENTS (5.2)

---

## Exercises: Simplify Expressions with Exponents

Instructions: For questions 1-10, simplify each expression with exponents.

1.

a.  $3^5$

b.  $9^1$

c.  $\left(\frac{1}{3}\right)^2$

d.  $(0.2)^4$

---

2.

a.  $10^4$

b.  $17^1$

c.  $\left(\frac{2}{9}\right)^2$

d.  $(0.5)^3$

**Solution**

a. 10,000

b. 17

c.  $\frac{4}{81}$

d. 0.125

---

3.

a.  $2^6$

b.  $14^1$

c.  $\left(\frac{2}{5}\right)^3$

d.  $(0.7)^2$ 

---

4.

a.  $8^3$

b.  $8^1$

c.  $\left(\frac{3}{4}\right)^3$

d.  $(0.4)^3$

**Solution**

a. 512

b. 8

c.  $\frac{27}{64}$

d. 0.064

---

5.

a.  $(-6)^4$

b.  $-6^4$ 

---

6.

a.  $(-2)^6$

b.  $-2^6$

**Solution**

a.  $64$

b.  $-64$ 

---

7.

a.  $-\left(\frac{1}{4}\right)^4$

b.  $\left(-\frac{1}{4}\right)^4$ 

---

8.

a.  $-\left(\frac{2}{3}\right)^2$

b.  $\left(-\frac{2}{3}\right)^2$

**Solution**

a.  $-\frac{4}{9}$

b.  $\frac{4}{9}$ 

---

9.

a.  $-0.5^2$

b.  $(-0.5)^2$ 

---

10.

a.  $-0.1^4$

b.  $(-0.1)^4$

**Solution**

a.  $-0.0001$

b.  $0.0001$ 

---

## Exercises: Simplify Expressions Using the Product Property for Exponents

Instructions: For questions 11-26, simplify each expression using the Product Property for Exponents.

11.  $d^3 \cdot d^6$ 

---

12.  $x^4 \cdot x^2$

**Solution**

$x^6$ 

---

13.  $n^{19} \cdot n^{12}$ 

---

14.  $q^{27} \cdot q^{15}$

**Solution**

$q^{42}$ 

---

15.

a.  $4^5 \cdot 4^9$

b.  $8^9 \cdot 8$ 

---

16.

a.  $3^{10} \cdot 3^6$

b.  $5 \cdot 5^4$

**Solution**

a.  $3^{16}$

b.  $5^5$ 

---

17.

a.  $y \cdot y^3$

b.  $z^{25} \cdot z^8$ 

---

18.

a.  $w^5 \cdot w$

b.  $u^{41} \cdot u^{53}$

**Solution**

a.  $w^6$

b.  $u^{94}$ 

---

19.  $w \cdot w^2 \cdot w^3$ 

---

20.  $y \cdot y^3 \cdot y^5$

**Solution**

$$y^9$$

---

$$21. a^4 \cdot a^3 \cdot a^9$$

---

$$22. c^5 \cdot c^{11} \cdot c^2$$

**Solution**

$$c^{18}$$

---

$$23. m^x \cdot m^3$$

---

$$24. n^y \cdot n^2$$

**Solution**

$$n^{y+2}$$

---

$$25. y^a \cdot y^b$$

---

$$26. x^p \cdot x^q$$

**Solution**

$$x^{p+q}$$

---

## Exercises: Simplify Expressions Using the Power Property for Exponents

Instructions: For questions 27-30, simplify each expression using the Power Property for Exponents.

27.

a.  $(m^4)^2$

b.  $(10^3)^6$

---

28.

a.  $(b^2)^7$

b.  $(3^8)^2$

**Solution**

a.  $b^{14}$

b.  $3^{16}$

---

29.

a.  $(y^3)^x$

b.  $(5^x)^y$

---

30.

a.  $(x^2)^y$

b.  $(7^a)^b$

**Solution**

a.  $x^{2y}$

b.  $7^{ab}$

---

## Exercises: Simplify Expressions Using the Product to a Power Property

Instructions: For questions 31-34, simplify each expression using the Product to a Power Property.

31.

a.  $(6a)^2$

b.  $(3xy)^2$

---

32.

a.  $(5x)^2$

b.  $(4ab)^2$

**Solution**

a.  $25x^2$

b.  $16a^2b^2$

---

33.

a.  $(-4m)^3$

b.  $(5ab)^3$ 

---

34.

a.  $(-7n)^3$

b.  $(3xyz)^4$

**Solution**

a.  $-343n^3$  b.  $81x^4y^4z^4$

## Exercises: Simplify Expressions by Applying Several Properties

Instructions: For questions 35-45, simplify each expression.

35.

a.  $(y^2)^4 \cdot (y^3)^2$

b.  $(10a^2b)^3$

36.

a.  $(w^4)^3 \cdot (w^5)^2$

b.  $(2xy^4)^5$

**Solution**

a.  $w^{22}$

b.  $32x^5y^{20}$

37.

- a.  $(-2r^3s^2)^4$   
b.  $(m^5)^3 \cdot (m^9)^4$
- 

38.

- a.  $(-10q^2p^4)^3$   
b.  $(n^3)^{10} \cdot (n^5)^2$

**Solution**

- a.  $-1000q^6p^{12}$   
b.  $n^{40}$
- 

39.

- a.  $(3x)^2(5x)$   
b.  $(5t^2)^3(3t)^2$
- 

40.

- a.  $(2y)^3(6y)$   
b.  $(10k^4)^3(5k^6)^2$

**Solution**

- a.  $48y^4$   
b.  $25,000k^{24}$
- 

41.

- a.  $(5a)^2(2a)^3$   
b.  $\left(\frac{1}{2}y^2\right)^3\left(\frac{2}{3}y\right)^2$
-

**42.**

a.  $(4b)^2(3b)^3$

b.  $\left(\frac{1}{2}j^2\right)^5\left(\frac{2}{5}j^3\right)^2$

**Solution**

a.  $432b^5$

b.  $\frac{1}{200}j^{16}$ 

---

**43.**

a.  $\left(\frac{2}{5}x^2y\right)^3$

b.  $\left(\frac{8}{9}xy^4\right)^2$ 

---

**44.**

a.  $(2r^2)^3(4r)^2$

b.  $(3x^3)^3(x^5)^4$

**Solution**

a.  $128r^8$

b.  $\frac{1}{200}j^{16}$ 

---

**45.**

a.  $(m^2n)^2(2mn^5)^4$

b.  $(3pq^4)^2(6p^6q)^2$ 

---

## Exercises: Multiply Monomials

Instructions: For questions 46-57, multiply the monomials.

46.  $(6y^7)(-3y^4)$

**Solution**

$$-18y^{11}$$

---

47.  $(-10x^5)(-3x^3)$

48.  $(-8u^6)(-9u)$

**Solution**

$$72u^7$$

---

49.  $(-6c^4)(-12c)$

50.  $\left(\frac{1}{5}f^8\right)(20f^3)$

**Solution**

$$4f^{11}$$

---

51.  $\left(\frac{1}{4}d^5\right)(36d^2)$

---

52.  $(4a^3b)(9a^2b^6)$

**Solution**

$36a^5b^7$

---

53.  $(6m^4n^3)(7mn^5)$

---

54.  $\left(\frac{4}{7}rs^2\right)(14rs^3)$

**Solution**

$8r^2s^5$

---

55.  $\left(\frac{5}{8}x^3y\right)(24x^5y)$

---

56.  $\left(\frac{2}{3}x^2y\right)\left(\frac{3}{4}xy^2\right)$

**Solution**

$\frac{1}{2}x^3y^3$

---

$$57. \left(\frac{3}{5}m^3n^2\right) \left(\frac{5}{9}m^2n^3\right)$$

---

## Exercises: Mixed Practice

Instructions: For questions 58-77, simplify each expression.

$$58. (x^2)^4 \cdot (x^3)^2$$

**Solution**

$$x^{14}$$

---

$$59. (y^4)^3 \cdot (y^5)^2$$

---

$$60. (a^2)^6 \cdot (a^3)^8$$

**Solution**

$$a^{36}$$

---

$$61. (b^7)^5 \cdot (b^2)^6$$

---

$$62. (2m^6)^3$$

**Solution**

$$8m^{18}$$

---

$$63. (3y^2)^4$$

---

$$64. (10x^2y)^3$$

**Solution**

$$1000x^6y^3$$

---

$$65. (2mn^4)^5$$

---

$$66. (-2a^3b^2)^4$$

**Solution**

$$16a^{12}b^8$$

---

$$67. (-10u^2v^4)^3$$

---

$$68. \left(\frac{2}{3}x^2y\right)^3$$

**Solution**

$$\frac{8}{27}x^6y^3$$

---

$$69. \left(\frac{7}{9}pq^4\right)^2$$

---

$$70. (8a^3)^2(2a)^4$$

**Solution**

$$1024a^{10}$$

---

$$71. (5r^2)^3(3r)^2$$

---

$$72. (10p^4)^3(5p^6)^2$$

**Solution**

$$25000p^{24}$$

---

$$73. (4x^3)^3(2x^5)^4$$

---

$$74. \left(\frac{1}{2}x^2y^3\right)^4(4x^5y^3)^2$$

**Solution**

$$x^{18}y^{18}$$

---

$$75. \left(\frac{1}{3}m^3n^2\right)^4 (9m^8n^3)^2$$

---

$$76. (3m^2n)^2 (2mn^5)^4$$

**Solution**

$$144m^8n^{22}$$

---

$$77. (2pq^4)^3 (5p^6q)^2$$

---

## Exercises: Use the Definition of a Negative Exponent

Instructions: For questions 78-105, simplify.

78.

a.  $4^{-2}$

b.  $10^{-3}$

---

79.

a.  $3^{-4}$

b.  $10^{-2}$

**Solution**

a.  $\frac{1}{81}$

b.  $\frac{1}{100}$

**80.**

a.  $5^{-3}$

b.  $10^{-5}$

**81.**

a.  $2^{-8}$

b.  $10^{-2}$

**Solution**

a.  $\frac{1}{256}$

b.  $\frac{1}{100}$

**82.**

a.  $\frac{1}{c^{-5}}$

b.  $\frac{1}{3^{-2}}$

**83.**

a.  $\frac{1}{c^{-5}}$

b.  $\frac{1}{5^{-2}}$

**Solution**

a.  $c^5$

b. 25

---

**84.**

a.  $\frac{1}{q^{-10}}$

b.  $\frac{1}{10^{-3}}$

---

**85.**

a.  $\frac{1}{t^{-9}}$

b.  $\frac{1}{10^{-4}}$

**Solution**

a.  $t^9$

b. 10000

---

**86.**

a.  $\left(\frac{5}{8}\right)^{-2}$

b.  $\left(-\frac{3m}{n}\right)^{-2}$

---

87.

a.  $\left(\frac{3}{10}\right)^{-2}$

b.  $\left(-\frac{2}{cd}\right)^{-3}$

**Solution**

a.  $\frac{100}{9}$

b.  $-\frac{c^3 d^3}{8}$ 

---

88.

a.  $\left(\frac{4}{9}\right)^{-3}$

b.  $\left(-\frac{u^2}{2v}\right)^{-5}$ 

---

89.

a.  $\left(\frac{7}{2}\right)^{-3}$

b.  $\left(-\frac{3}{xy^2}\right)^{-3}$

**Solution**

a.  $\frac{8}{343}$

b.  $-\frac{x^3 y^6}{27}$ 

---

90.

a.  $(-5)^{-2}$

b.  $-5^{-2}$

c.  $\left(-\frac{1}{5}\right)^{-2}$

d.  $-\left(\frac{1}{5}\right)^{-2}$ 

---

91.

a.  $(-7)^{-2}$

b.  $-7^{-2}$

c.  $\left(-\frac{1}{7}\right)^{-2}$

d.  $-\left(\frac{1}{7}\right)^{-2}$

**Solution**

a.  $\frac{1}{49}$

b.  $-\frac{1}{49}$

c. 49

d. -49

---

92.

a.  $-3^{-3}$

b.  $\left(-\frac{1}{3}\right)^{-3}$

c.  $-\left(\frac{1}{3}\right)^{-3}$

d.  $(-3)^{-3}$ 

---

93.

a.  $-5^{-3}$

b.  $\left(-\frac{1}{5}\right)^{-3}$

c.  $-\left(\frac{1}{5}\right)^{-3}$

d.  $(-5)^{-3}$

**Solution**

a.  $-\frac{1}{125}$

b.  $-125$

c.  $-125$

d.  $-\frac{1}{125}$ 

---

94.

a.  $3 \cdot 5^{-1}$

b.  $(3 \cdot 5)^{-1}$ 

---

95.

a.  $2 \cdot 5^{-1}$

b.  $(2 \cdot 5)^{-1}$

**Solution**

a.  $\frac{2}{5}$

b.  $\frac{1}{10}$ 

---

96.

a.  $4 \cdot 5^{-2}$

b.  $(4 \cdot 5)^{-2}$ 

---

97.

a.  $3 \cdot 4^{-2}$

b.  $(3 \cdot 4)^{-2}$

**Solution**

a.  $\frac{3}{16}$

b.  $\frac{1}{144}$ 

---

98.

a.  $m^{-4}$

b.  $(x^3)^{-4}$ 

---

99.

a.  $b^{-5}$

b.  $(k^2)^{-5}$

**Solution**

a.  $\frac{1}{b^5}$

b.  $\frac{1}{k^{10}}$ 

---

100.

- a.  $p^{-10}$   
b.  $(q^6)^{-8}$
- 

101.

- a.  $s^{-8}$   
b.  $(a^9)^{-10}$

**Solution**

- a.  $\frac{1}{s^8}$   
b.  $\frac{1}{a^{90}}$
- 

102.

- a.  $7n^{-1}$   
b.  $(7n)^{-1}$   
c.  $(-7n)^{-1}$
- 

103.

- a.  $6r^{-1}$   
b.  $(6r)^{-1}$   
c.  $(-6r)^{-1}$

**Solution**

- a.  $\frac{6}{r}$   
b.  $\frac{1}{6r}$   
c.  $-\frac{1}{6r}$
-

104.

- a.  $(3p)^{-2}$
  - b.  $3p^{-2}$
  - c.  $-3p^{-2}$
- 

105.

- a.  $(2q)^{-4}$
- b.  $2q^{-4}$
- c.  $-2q^{-4}$

**Solution**

- a.  $\frac{1}{16q^4}$
- b.  $\frac{2}{q^4}$
- c.  $-\frac{2}{q^4}$

## Exercises: Simplify Expressions with Integer Exponents

Instructions: For questions 106-127, simplify.

106.

- a.  $b^4 b^{-8}$
  - b.  $r^{-2} r^5$
  - c.  $x^{-7} x^{-3}$
- 

107.

- a.  $s^3 \cdot s^{-7}$

**b.**  $q^{-8} \cdot q^3$   
**c.**  $y^{-2} \cdot y^{-5}$

**Solution**

a.  $\frac{1}{s^4}$   
b.  $\frac{1}{q^5}$   
c.  $\frac{1}{y^7}$

---

**108.**

**a.**  $a^3 \cdot a^{-3}$   
**b.**  $a \cdot a^3$   
**c.**  $a \cdot a^{-3}$

---

**109.**

**a.**  $y^5 \cdot y^{-5}$   
**b.**  $y \cdot y^5$   
**c.**  $y \cdot y^{-5}$

**Solution**

a. 1  
b.  $y^6$   
c.  $\frac{1}{y^4}$

---

**110.**  $p^5 \cdot p^{-2} \cdot p^{-4}$

---

**111.**  $x^4 \cdot x^{-2} \cdot x^{-3}$

**Solution**

$$\frac{1}{x}$$

---

**112.**  $(w^4 x^{-5})(w^{-2} x^{-4})$

---

**113.**  $(m^3 n^{-3})(m^{-5} n^{-1})$

**Solution**

$$\frac{1}{m^2 n^4}$$

---

**114.**  $(uv^{-2})(u^{-5}v^{-3})$

---

**115.**  $(pq^{-4})(p^{-6}q^{-3})$

**Solution**

$$\frac{1}{p^5 q^7}$$

---

**116.**  $(-6c^{-3}d^9)(2c^4d^{-5})$

---

**117.**  $(-2j^{-5}k^8)(7j^2k^{-3})$

**Solution**

$$-\frac{14k^5}{j^3}$$

---

$$118. (-4r^{-2}s^{-8})(9r^4s^3)$$

---

$$119. (-5m^4n^6)(8m^{-5}n^{-3})$$

**Solution**

$$-\frac{40n^3}{m}$$

---

$$120. (5x^2)^{-2}$$

---

$$121. (4y^3)^{-3}$$

**Solution**

$$\frac{1}{64y^9}$$

---

$$122. (3z^{-3})^2$$

---

$$123. (2p^{-5})^2$$

**Solution**

$$\frac{4}{p^{10}}$$

---

$$124. \frac{t^9}{t^{-3}}$$

---

$$125. \frac{n^5}{n^{-2}}$$

**Solution**

$$n^7$$

---

$$126. \frac{x^{-7}}{x^{-3}}$$

---

$$127. \frac{y^{-5}}{y^{-10}}$$

**Solution**

$$y^5$$

## Exercises: Everyday Math

Instructions: For questions 128-131, answer the given everyday math word problems.

**128. Email.** Kate emails a flyer to ten of her friends and tells them to forward it to ten of their friends, who forward it to ten of their friends, and so on. The number of people who receive the email on the second round is  $10^2$ , on the third round is  $10^3$ , as shown in the table below. How many people will receive the email on the sixth round? Simplify the expression to show the number of people who receive the email.

**Table 5P.2.1: Number of People Receiving Email per Round**

Round	Number of people
1	10
2	$10^2$
3	$10^3$
...	...
6	?

**Solution**

1,000,000

---

**129. Salary.** Jamal's boss gives him a 3% raise every year on his birthday. This means that each year, Jamal's salary is 1.03 times his last year's salary. If his original salary was \$35,000, his salary after 1 year was  $\$35,000(1.03)$ , after 2 years was  $\$35,000(1.03)^2$ , after 3 years was  $\$35,000(1.03)^3$ , as shown in the table below. What will Jamal's salary be after 10 years? Simplify the expression, to show Jamal's salary in dollars.

**Figure 5P.2.2: Jamal's Salary by Year**

Year	Salary
1	\$35,000 (1.03)
2	$\$35,000(1.03)^2$
3	$\$35,000(1.03)^3$
...	...
10	?

**130. Clearance.** A department store is clearing out merchandise in order to make room for new inventory. The plan is to mark down items by 30% each week. This means that each week the cost of an item is 70% of the previous week's cost. If the original cost of a sofa was \$1,000, the cost for the first week would be  $\$1,000 (0.70)$  and the cost of the item during the second week would be  $\$1,000(0.70)^2$ . Complete the table shown below. What will be the cost of the sofa during the fifth week? Simplify the expression, to show the cost in dollars.

**Figure 5P.2.3: Cost of Merchandise per Week**

Week	Cost
1	$\$1,000 (0.70)$
2	$\$1,000(0.70)^2$
3	
...	...
5	?

**Solution**

\$168.07

**131. Depreciation.** Once a new car is driven away from the dealer, it begins to lose value. Each year,

a car loses 10% of its value. This means that each year the value of a car is 90% of the previous year's value. If a new car was purchased for \$20,000, the value at the end of the first year would be \$20,000 (0.90) and the value of the car after the end of the second year would be  $\$20,000(0.90)^2$ . Complete the table shown below. What will be the value of the car at the end of the eighth year? Simplify the expression, to show the value in dollars.

Figure 5P.2.4: Depreciation of a New Car over 8 years

Year	Cost
1	\$20,000 (0.90)
2	$\$20,000(0.90)^2$
3	
...	...
8	?

## Exercises: Writing Exercises

Instructions: For questions 132-135,

132. Use the Product Property for Exponents to explain why  $x \cdot x = x^2$ .

**Solution**

Answers will vary.

133. Explain why  $-5^3 = (-5)^3$  but  $-5^4 \neq (-5)^4$ .

134. Jorge thinks  $\left(\frac{1}{2}\right)^2$  is 1. What is wrong with his reasoning?

### **Solution**

Answers will vary.

---

**135. Explain why  $x^3 \cdot x^5$  is  $x^8$ , and not  $x^{15}$ .**

- a. Explain the meaning of the exponent in the expression  $2^3$ .**
- b. Explain the meaning of the exponent in the expression  $2^{-3}$ .**

# EXERCISES: MULTIPLY POLYNOMIALS (5.3)

---

## Exercises: Multiply a Polynomial by a Monomial

Instructions: For questions 1-64, multiply.

1.  $4(w + 10)$

**Solution**

$$4w + 40$$

---

2.  $6(b + 8)$

3.  $-3(a + 7)$

**Solution**

$$-3a - 21$$

---

4.  $-5(p + 9)$

5.  $2(x - 7)$

**Solution**

$$2x - 14$$

---

$$6. 7(y - 4)$$

---

$$7. -3(k - 4)$$

**Solution**

$$-3k + 12$$

---

$$8. -8(j - 5)$$

---

$$9. q(q + 5)$$

**Solution**

$$q^2 + 5q$$

---

$$10. k(k + 7)$$

---

$$11. -b(b + 9)$$

**Solution**

$$-b^2 - 9b$$

---

12.  $-y(y + 3)$

---

13.  $-x(x - 10)$

**Solution**

$$-x^2 + 10x$$

---

14.  $-p(p - 15)$

---

15.  $6r(4r + s)$

**Solution**

$$24r^2 + 6rs$$

---

16.  $5c(9c + d)$

---

17.  $12x(x - 10)$

**Solution**

$$12x^2 - 120x$$

---

18.  $9m(m - 11)$

---

19.  $-9a(3a + 5)$

**Solution**

$$-27a^2 - 45a$$

---

20.  $-4p(2p + 7)$

---

21.  $3(p^2 + 10p + 25)$

**Solution**

$$3p^2 + 30p + 75$$

---

22.  $6(y^2 + 8y + 16)$

---

23.  $-8x(x^2 + 2x - 15)$

**Solution**

$$-8x^3 - 16x^2 + 120x$$

---

24.  $-5t(t^2 + 3t - 18)$

---

25.  $5q^3(q^3 - 2q + 6)$

**Solution**

$$5q^6 - 10q^4 + 30q^3$$

---

26.  $4x^3 (x^4 - 3x + 7)$

---

27.  $-8y (y^2 + 2y - 15)$

**Solution**

$$-8y^3 - 16y^2 + 120y$$

---

28.  $-5m (m^2 + 3m - 18)$

---

29.  $5q^3 (q^2 - 2q + 6)$

**Solution**

$$5q^5 - 10q^4 + 30q^3$$

---

30.  $9r^3 (r^2 - 3r + 5)$

---

31.  $-4z^2 (3z^2 + 12z - 1)$

**Solution**

$$-12z^4 - 48z^3 + 4z^2$$

---

32.  $-3x^2 (7x^2 + 10x - 1)$

---

33.  $(2m - 9)m$

**Solution**

$$2m^2 - 9m$$

---

34.  $(8j - 1)j$

---

35.  $(w - 6) \cdot 8$

**Solution**

$$8w - 48$$

---

36.  $(k - 4) \cdot 5$

---

37.  $4(x + 10)$

**Solution**

$$4x + 40$$

---

38.  $6(y + 8)$

---

39.  $15(r - 24)$

**Solution**

$$15r - 360$$

---

40.  $12(v - 30)$

---

41.  $-3(m + 11)$

**Solution**

$-3m - 33$

---

42.  $-4(p + 15)$

---

43.  $-8(z - 5)$

**Solution**

$-8z + 40$

---

44.  $-3(x - 9)$

---

45.  $u(u + 5)$

**Solution**

$u^2 + 5u$

---

46.  $q(q + 7)$

---

**47.**  $n(n^2 - 3n)$

**Solution**

$$n^3 - 3n^2$$

---

**48.**  $s(s^2 - 6s)$

**Solution**

**49.**  $6x(4x + y)$

**Solution**

$$24x^2 + 6xy$$

---

**50.**  $5a(9a + b)$

**Solution**

**51.**  $5p(11p - 5q)$

**Solution**

$$55p^2 - 25pq$$

---

**52.**  $12u(3u - 4v)$

**Solution**

**53.**  $3(v^2 + 10v + 25)$

**Solution**

$$3v^2 + 30v + 75$$

---

54.  $6(x^2 + 8x + 16)$

---

55.  $2n(4n^2 - 4n + 1)$

**Solution**

$$8n^3 - 8n^2 + 2n$$

---

56.  $3r(2r^2 - 6r + 2)$

---

57.  $-8y(y^2 + 2y - 15)$

**Solution**

$$-8y^3 - 16y^2 + 120y$$

---

58.  $-5m(m^2 + 3m - 18)$

---

59.  $5q^3(q^2 - 2q + 6)$

**Solution**

$$5q^5 - 10q^4 + 30q^3$$

---

60.  $9r^3(r^2 - 3r + 5)$

---

**61.**  $-4z^2 (3z^2 + 12z - 1)$

**Solution**

$$-12z^4 - 48z^3 + 4z^2$$

---

**62.**  $-3x^2 (7x^2 + 10x - 1)$

**63.**  $(2y - 9) y$

**Solution**

$$18y^2 - 9y$$

---

**64.**  $(8b - 1) b$ 

---

### Exercises: Multiply a Binomial by a Binomial

Instructions: For questions 65-68, multiply the following binomials using:

- a. the Distributive Property
- b. the FOIL method
- c. the Vertical Method.

**65.**  $(w + 5) (w + 7)$

**Solution**

$$w^2 + 12w + 35$$

---

66.  $(y + 9)(y + 3)$

---

67.  $(p + 11)(p - 4)$

**Solution**

$$p^2 + 7p - 44$$

---

68.  $(q + 4)(q - 8)$

---

### Exercises: Multiply a Binomial by a Binomial

Instructions: For questions 69-94, multiply the binomials. Use any method.

69.  $(x + 8)(x + 3)$

**Solution**

$$x^2 + 11x + 24$$

---

70.  $(y + 7)(y + 4)$

---

71.  $(y - 6)(y - 2)$

**Solution**

$$y^2 - 8y + 12$$

---

72.  $(x - 7)(x - 2)$

---

73.  $(w - 4)(w + 7)$

**Solution**

$$w^2 + 3w - 28$$

---

74.  $(q - 5)(q + 8)$

---

75.  $(p + 12)(p - 5)$

**Solution**

$$p^2 + 7p - 60$$

---

76.  $(m + 11)(m - 4)$

---

77.  $(6p + 5)(p + 1)$

**Solution**

$$6p^2 + 11p + 5$$

---

78.  $(7m + 1)(m + 3)$

---

79.  $(2t - 9)(10t + 1)$

**Solution**

$$20t^2 - 88t - 9$$

---

80.  $(3r - 8)(11r + 1)$

81.  $(5x - y)(3x - 6)$

**Solution**

$$15x^2 - 3xy - 30x + 6y$$

---

82.  $(10a - b)(3a - 4)$

83.  $(a + b)(2a + 3b)$

**Solution**

$$2a^2 + 5ab + 3b^2$$

---

84.  $(r + s)(3r + 2s)$

85.  $(4z - y)(z - 6)$

**Solution**

$$4z^2 - 24z - zy + 6y$$

---

86.  $(5x - y)(x - 4)$

---

87.  $(x^2 + 3)(x + 2)$

**Solution**

$$x^3 + 2x^2 + 3x + 6$$

---

88.  $(y^2 - 4)(y + 3)$

---

89.  $(x^2 + 8)(x^2 - 5)$

**Solution**

$$x^4 + 3x^2 - 40$$

---

90.  $(y^2 - 7)(y^2 - 4)$

---

91.  $(5ab - 1)(2ab + 3)$

**Solution**

$$10a^2b^2 + 13ab - 3$$

---

92.  $(2xy + 3)(3xy + 2)$

---

93.  $(6pq - 3)(4pq - 5)$

**Solution**

$$24p^2q^2 - 42pq + 15$$

---

94.  $(3rs - 7)(3rs - 4)$

---

### Exercises: Multiply a Trinomial by a Binomial

Instructions: For questions 95-98, multiply using:

- a. the Distributive Property
- b. the Vertical Method

95.  $(x + 5)(x^2 + 4x + 3)$

**Solution**

$$x^3 + 9x^2 + 23x + 15$$

---

96.  $(u + 4)(u^2 + 3u + 2)$

---

97.  $(y + 8)(4y^2 + y - 7)$

**Solution**

$$4y^3 + 33y^2 + y - 56$$

---

98.  $(a + 10)(3a^2 + a - 5)$

---

### Exercises: Multiply a Trinomial by a Binomial

Instructions: For questions 99-102, multiply. Use either method.

99.  $(w - 7)(w^2 - 9w + 10)$

**Solution**

$$w^3 - 16w^2 + 73w - 70$$

---

100.  $(p - 4)(p^2 - 6p + 9)$

---

101.  $(3q + 1)(q^2 - 4q - 5)$

**Solution**

$$3q^3 - 11q^2 - 19q - 5$$

---

102.  $(6r + 1)(r^2 - 7r - 9)$

---

## Exercises: Mixed Practice

Instructions: For questions 103-121, solve.

**103.**  $(10y - 6) + (4y - 7)$

**Solution**

$$14y - 13$$

---

**104.**  $(15p - 4) + (3p - 5)$

---

**105.**  $(x^2 - 4x - 34) - (x^2 + 7x - 6)$

**Solution**

$$-11x - 28$$

---

**106.**  $(j^2 - 8j - 27) - (j^2 + 2j - 12)$

---

**107.**  $5q(3q^2 - 6q + 11)$

**Solution**

$$15q^3 - 30q^2 + 55q$$

---

108.  $8t(2t^2 - 5t + 6)$

---

109.  $(s - 7)(s + 9)$

**Solution**

$$s^2 + 2s - 63$$

---

110.  $(x - 5)(x + 13)$

---

111.  $(y^2 - 2y)(y + 1)$

**Solution**

$$y^3 - y^2 - 2y$$

---

112.  $(a^2 - 3a)(4a + 5)$

---

113.  $(3n - 4)(n^2 + n - 7)$

**Solution**

$$3n^3 - n^2 - 25n + 28$$

---

114.  $(6k - 1)(k^2 + 2k - 4)$

---

**115.**  $(7p + 10)(7p - 10)$

**Solution**

$$49p^2 - 100$$

---

**116.**  $(3y + 8)(3y - 8)$ 

---

**117.**  $(4m^2 - 3m - 7)m^2$

**Solution**

$$4m^4 - 3m^3 - 7m^2$$

---

**118.**  $(15c^2 - 4c + 5)c^4$ 

---

**119.**  $(5a + 7b)(5a + 7b)$

**Solution**

$$25a^2 + 70ab + 49b^2$$

---

**120.**  $(3x - 11y)(3x - 11y)$ 

---

**121.**  $(4y + 12z)(4y - 12z)$

**Solution**

$$16y^2 - 144z^2$$

---

## Exercises: Everyday Math

Instructions: For questions 122-123, solve the given everyday math word problems.

**122. Mental math.** You can use binomial multiplication to multiply numbers without a calculator. Say you need to multiply 13 times 15. Think of 13 as  $10 + 3$  and 15 as  $10 + 5$ .

- a. Multiply  $(10 + 3)(10 + 5)$  by the FOIL method.
- b. Multiply  $13 \cdot 15$  without using a calculator.
- c. Which way is easier for you? Why?

---

**123. Mental math** You can use binomial multiplication to multiply numbers without a calculator. Say you need to multiply 18 times 17. Think of 18 as  $20 - 2$  and 17 as  $20 - 3$ .

- a. Multiply  $(20 - 2)(20 - 3)$  by the FOIL method.
- b. Multiply  $18 \cdot 17$  without using a calculator.
- c. Which way is easier for you? Why?

**Solution**

- a. 306
  - b. 306
  - c. Answers will vary.
- 

## Exercises: Writing Exercises

Instructions: For questions 124-129, answer the given writing exercises.

**124. Which method do you prefer to use when multiplying two binomials: the Distributive**

**Property, the FOIL method, or the Vertical Method? Why?**

---

**125. Which method do you prefer to use when multiplying a trinomial by a binomial: the Distributive Property or the Vertical Method? Why?**

**Solution**

Answers will vary.

---

$$(x + 2)(x - 2)$$

**126. Multiply the following:**  $(y + 7)(y - 7)$

$$(w + 5)(w - 5)$$

**Explain the pattern that you see in your answers.**

---

**127. Multiply the following:**

$$(m - 3)(m + 3)$$

$$(n - 10)(n + 10)$$

$$(p - 8)(p + 8)$$

**Explain the pattern that you see in your answers.**

**Solution**

Answers may vary.

---

**128. Multiply the following:**

$$(p + 3)(p + 3)$$

$$(q + 6)(q + 6)$$

$$(r + 1)(r + 1)$$

**Explain the pattern that you see in your answers.**

---

**129. Multiply the following:**

$$(x - 4)(x - 4)$$

$$(y - 1)(y - 1)$$

$$(z - 7)(z - 7)$$

**Explain the pattern that you see in your answers.**

**Solution**

Answers may vary.

# EXERCISES: SPECIAL PRODUCTS (5.4)

---

## Exercises: Square a Binomial Using the Binomial Squares Pattern

Instructions: For questions 1-20, square each binomial using the Binomial Squares Pattern.

1.  $(w + 4)^2$

---

2.  $(q + 12)^2$

**Solution**

$$q^2 + 24q + 144$$

---

3.  $\left(y + \frac{1}{4}\right)^2$

---

4.  $\left(x + \frac{2}{3}\right)^2$

**Solution**

$$x^2 + \frac{4}{3}x + \frac{4}{9}$$

---

5.  $(b - 7)^2$ 

---

6.  $(y - 6)^2$

**Solution**

$y^2 - 12y + 36$ 

---

7.  $(m - 15)^2$ 

---

8.  $(p - 13)^2$

**Solution**

$p^2 - 26p + 169$ 

---

9.  $(3d + 1)^2$ 

---

10.  $(4a + 10)^2$

**Solution**

$16a^2 + 80a + 100$ 

---

11.  $\left(2q + \frac{1}{3}\right)^2$ 

---

12.  $\left(3z + \frac{1}{5}\right)^2$

**Solution**

$$9z^2 + \frac{6}{5}z + \frac{1}{25}$$

---

13.  $(3x - y)^2$

---

14.  $(2y - 3z)^2$

**Solution**

$$4y^2 - 12yz + 9z^2$$

---

15.  $\left(\frac{1}{5}x - \frac{1}{7}y\right)^2$

---

16.  $\left(\frac{1}{8}x - \frac{1}{9}y\right)^2$

**Solution**

$$\frac{1}{64}x^2 - \frac{1}{36}xy + \frac{1}{81}y^2$$

---

17.  $(3x^2 + 2)^2$

---

18.  $(5u^2 + 9)^2$

**Solution**

$$25u^4 + 90u^2 + 81$$

---

19.  $(4y^3 - 2)^2$

20.  $(8p^3 - 3)^2$

**Solution**

$$64p^6 - 48p^3 + 9$$

---

### Exercises: Multiply Conjugates Using the Product of Conjugates Pattern

Instructions: For questions 21-44, multiply each pair of conjugates using the Product of Conjugates Pattern.

21.  $(m - 7)(m + 7)$

22.  $(c - 5)(c + 5)$

**Solution**

$$c^2 - 25$$

---

$$23. \left(x + \frac{3}{4}\right) \left(x - \frac{3}{4}\right)$$

---

$$24. \left(b + \frac{6}{7}\right) \left(b - \frac{6}{7}\right)$$

**Solution**

$$b^2 - \frac{36}{49}$$

---

$$25. (5k + 6)(5k - 6)$$

---

$$26. (8j + 4)(8j - 4)$$

**Solution**

$$64j^2 - 16$$

---

$$27. (11k + 4)(11k - 4)$$

---

$$28. (9c + 5)(9c - 5)$$

**Solution**

$$81c^2 - 25$$

---

$$29. (11 - b)(11 + b)$$

---

30.  $(13 - q)(13 + q)$

**Solution**

$$169 - q^2$$

---

31.  $(5 - 3x)(5 + 3x)$ 

---

32.  $(4 - 6y)(4 + 6y)$

**Solution**

$$16 - 36y^2$$

---

33.  $(9c - 2d)(9c + 2d)$ 

---

34.  $(7w + 10x)(7w - 10x)$

**Solution**

$$49w^2 - 100x^2$$

---

35.  $\left(m + \frac{2}{3}n\right)\left(m - \frac{2}{3}n\right)$ 

---

36.  $\left(p + \frac{4}{5}q\right)\left(p - \frac{4}{5}q\right)$

**Solution**

$$p^2 - \frac{16}{25}q^2$$

---

$$37. (ab - 4)(ab + 4)$$

---

$$38. (xy - 9)(xy + 9)$$

**Solution**

$$x^2y^2 - 81$$

---

$$39. \left(uv - \frac{3}{5}\right)\left(uv + \frac{3}{5}\right)$$

---

$$40. \left(rs - \frac{2}{7}\right)\left(rs + \frac{2}{7}\right)$$

**Solution**

$$r^2s^2 - \frac{4}{49}$$

---

$$41. (2x^2 - 3y^4)(2x^2 + 3y^4)$$

---

$$42. (6m^3 - 4n^5)(6m^3 + 4n^5)$$

**Solution**

$$36m^6 - 16n^{10}$$

---

43.  $(12p^3 - 11q^2)(12p^3 + 11q^2)$

---

44.  $(15m^2 - 8n^4)(15m^2 + 8n^4)$

**Solution**

$225m^4 - 64n^8$

---

### Exercises: Recognize and Use the Appropriate Special Product Pattern

Instructions: For questions 45-48, find each product.

45.

- a.  $(p - 3)(p + 3)$
  - b.  $(t - 9)^2$
  - c.  $(m + n)^2$
  - d.  $(2x + y)(x - 2y)$
- 

46.

- a.  $(2r + 12)^2$
- b.  $(3p + 8)(3p - 8)$
- c.  $(7a + b)(a - 7b)$
- d.  $(k - 6)^2$

**Solution**

a.  $4r^2 + 48r + 144$

- b.  $9p^2 - 64$
  - c.  $7a^2 - 48ab - 7b^2$
  - d.  $k^2 - 12k + 36$
- 

47.

- a.  $(a^5 - 7b)^2$
  - b.  $(x^2 + 8y)(8x - y^2)$
  - c.  $(r^6 + s^6)(r^6 - s^6)$
  - d.  $(y^4 + 2z)^2$
- 

48.

- a.  $(x^5 + y^5)(x^5 - y^5)$
- b.  $(m^3 - 8n)^2$
- c.  $(9p + 8q)^2$
- d.  $(r^2 - s^3)(r^3 + s^2)$

**Solution**

- a.  $x^{10} - y^{10}$
- b.  $m^6 - 16m^3n + 64n^2$
- c.  $81p^2 + 144pq + 64q^2$
- d.  $r^5 + r^2s^2 - r^3s^3 - s^5$

## Exercises: Everyday Math

Instructions: For questions 49-50, answer the given everyday math word problems.

**49. Mental math.** You can use the product of conjugates pattern to multiply numbers without a calculator. Say you need to multiply 47 times 53. Think of 47 as  $50 - 3$  and 53 as  $50 + 3$ .

a. Multiply  $(50 - 3)(50 + 3)$  by using the product of conjugates pattern,  $(a - b)(a + b) = a^2 - b^2$ .

b. Multiply  $47 \cdot 53$  without using a calculator.

c. Which way is easier for you? Why?

**50. Mental math.** You can use the binomial squares pattern to multiply numbers without a calculator. Say you need to square 65. Think of 65 as  $60 + 5$ .

a. Multiply  $(60 + 5)^2$  by using the binomial squares pattern,  $(a + b)^2 = a^2 + 2ab + b^2$ .

.

b. Square 65 without using a calculator.

c. Which way is easier for you? Why?

**Solution**

a. 4,225

b. 4,225

c. Answers will vary.

## Exercises: Writing Exercises

Instructions: For questions 51-54, answer the given writing exercises.

**51. How do you decide which pattern to use?**

**52. Why does  $(a + b)^2$  result in a trinomial, but  $(a - b)(a + b)$  result in a binomial?**

**Solution**

Answers will vary.

**53. Marta did the following work on her homework paper:**

$$(3 - y)^2$$

$$3^2 - y^2$$

$$9 - y^2$$

**Explain what is wrong with Marta's work.**

---

**54. Use the order of operations to show that  $(3 + 5)^2$  is 64, and then use that numerical example to explain why  $(a + b)^2 \neq a^2 + b^2$ .**

**Solution**

Answers will vary.

# EXERCISES: DIVIDE MONOMIALS (5.5)

---

## Exercises: Simplify Expressions Using the Quotient Property for Exponents

Instructions: For questions 1-8, simplify.

1.

a.  $\frac{x^{18}}{x^3}$

b.  $\frac{5^{12}}{5^3}$

---

2.

a.  $\frac{y^{20}}{y^{10}}$

b.  $\frac{7^{16}}{7^2}$

**Solution**

a.  $y^{10}$

b.  $7^{14}$

---

3.

a.  $\frac{p^{21}}{p^7}$

b.  $\frac{4^{16}}{4^4}$

---

4.

a.  $\frac{u^{24}}{u^3}$

b.  $\frac{9^{15}}{9^5}$

**Solution**

a.  $u^{21}$

b.  $9^{10}$

5.

a.  $\frac{q^{18}}{q^{36}}$

b.  $\frac{10^2}{10^3}$

---

6.

a.  $\frac{t^{10}}{t^{40}}$

b.  $\frac{8^3}{8^5}$

**Solution**

a.  $\frac{1}{t^{30}}$

b.  $\frac{1}{64}$

7.

a.  $\frac{b}{b^9}$

b.  $\frac{4}{4^6}$

8.

a.  $\frac{x}{x^7}$

b.  $\frac{10}{10^3}$

**Solution**

a.  $\frac{1}{x^6}$

b.  $\frac{1}{100}$

## Exercises: Simplify Expressions with Zero Exponents

Instructions: For questions 9-18, simplify.

9.

- a.  $20^0$   
b.  $b^0$
- 

10.

- a.  $13^0$   
b.  $k^0$

**Solution**

- a. 1  
b. 1
- 

11.

- a.  $-27^0$   
b.  $-(27^0)$
- 

12.

- a.  $-15^0$   
b.  $-(15^0)$

**Solution**

- a.  $-1$   
b.  $-1$
- 

13.

- a.  $(25x)^0$   
b.  $25x^0$
-

14.

a.  $(6y)^0$

b.  $6y^0$

**Solution**

a. 1

b. 6

---

15.

a.  $(12x)^0$

b.  $(-56p^4q^3)^0$ 

---

16.

a.  $7y^0(17y)^0$

b.  $(-93c^7d^{15})^0$

**Solution**

a. 7

b. 1

---

17.

a.  $12n^0 - 18m^0$

b.  $(12n)^0 - (18m)^0$ 

---

18.

a.  $15r^0 - 22s^0$

b.  $(15r)^0 - (22s)^0$

**Solution**

a.  $-7$

b.  $0$

---

## Exercises: Simplify Expressions Using the Quotient to a Power Property

Instructions: For questions 19-22, simplify.

19.

a.  $\left(\frac{3}{4}\right)^3$

b.  $\left(\frac{p}{2}\right)^5$

c.  $\left(\frac{x}{y}\right)^6$

20.

a.  $\left(\frac{2}{5}\right)^2$

b.  $\left(\frac{x}{3}\right)^4$

c.  $\left(\frac{a}{b}\right)^5$

**Solution**

a.  $\frac{4}{25}$

b.  $\frac{x^4}{81}$

c.  $\frac{a^5}{b^5}$ 

---

21.

a.  $\left(\frac{a}{3b}\right)^4$

b.  $\left(\frac{5}{4m}\right)^2$ 

---

22.

a.  $\left(\frac{x}{2y}\right)^3$

b.  $\left(\frac{10}{3q}\right)^4$

**Solution**

a.  $\frac{x^3}{8y^3}$

b.  $\frac{10,000}{81q^4}$ 

---

## Exercises: Simplify Expressions by Applying Several Properties

Instructions: For questions 23-50, simplify.

$$23. \frac{(a^2)^3}{a^4}$$

---

$$24. \frac{(p^3)^4}{p^5}$$

**Solution**

$$p^7$$

---

$$25. \frac{(y^3)^4}{y^{10}}$$

---

$$26. \frac{(x^4)^5}{x^{15}}$$

**Solution**

$$x^5$$

---

$$27. \frac{u^6}{(u^3)^2}$$

---

$$28. \frac{v^{20}}{(v^4)^5}$$

**Solution**

$$1$$

---

$$29. \frac{m^{12}}{(m^8)^3}$$

---

$$30. \frac{n^8}{(n^6)^4}$$

**Solution**

$$\frac{1}{n^{16}}$$

---

$$31. \left( \frac{p^9}{p^3} \right)^5$$

---

$$32. \left( \frac{q^8}{q^2} \right)^3$$

**Solution**

$$q^{18}$$

---

$$33. \left( \frac{r^2}{r^6} \right)^3$$

---

$$34. \left( \frac{m^4}{m^7} \right)^4$$

**Solution**

$$\frac{1}{m^{12}}$$

---

$$35. \left( \frac{p}{r^{11}} \right)^2$$

---

$$36. \left( \frac{a}{b^6} \right)^3$$

**Solution**

$$\frac{a^3}{b^{18}}$$

---

$$37. \left( \frac{w^5}{x^3} \right)^8$$

---

$$38. \left( \frac{y^4}{z^{10}} \right)^5$$

**Solution**

$$\frac{y^{20}}{z^{50}}$$

---

$$39. \left( \frac{2j^3}{3k} \right)^4$$

$$40. \left( \frac{3m^5}{5n} \right)^3$$

**Solution**

$$\frac{27m^{15}}{125n^3}$$

---

$$41. \left( \frac{3c^2}{4d^6} \right)^3$$

$$42. \left( \frac{5u^7}{2v^3} \right)^4$$

**Solution**

$$\frac{625u^{28}}{16v^{12}}$$

---

$$43. \left( \frac{k^2 k^8}{k^3} \right)^2$$

---

$$44. \left( \frac{j^2 j^5}{j^4} \right)^3$$

**Solution**

$$j^9$$

---

$$45. \frac{(t^2)^5 (t^4)^2}{(t^3)^7}$$

---

$$46. \frac{(q^3)^6 (q^2)^3}{(q^4)^8}$$

**Solution**

$$\frac{1}{q^8}$$

---

$$47. \frac{(-2p^2)^4 (3p^4)^2}{(-6p^3)^2}$$

---

$$48. \frac{(-2k^3)^2 (6k^2)^4}{(9k^4)^2}$$

**Solution**

$$64k^6$$

---

$$49. \frac{(-4m^3)^2 (5m^4)^3}{(-10m^6)^3}$$

---

$$50. \frac{(-10n^2)^3 (4n^5)^2}{(2n^8)^2}$$

**Solution**

$$-4,000$$

---

## Exercises: Divide Monomials

Instructions: For questions 51-66, divide the monomials.

$$51. 56b^8 \div 7b^2$$

---

$$52. 63v^{10} \div 9v^2$$

**Solution**

$$7v^8$$

---

$$53. -88y^{15} \div 8y^3$$

---

$$54. -72u^{12} \div 12u^4$$

**Solution**

$$-6u^8$$

---

$$55. \frac{45a^6b^8}{-15a^{10}b^2}$$

---

$$56. \frac{54x^9y^3}{-18x^6y^{15}}$$

**Solution**

$$-\frac{3x^3}{y^{12}}$$

---

$$57. \frac{15r^4s^9}{18r^9s^2}$$

---

$$58. \frac{20m^8n^4}{30m^5n^9}$$

**Solution**

$$\frac{-2m^3}{3n^5}$$

---

$$59. \frac{18a^4b^8}{-27a^9b^5}$$

---

$$60. \frac{45x^5y^9}{-60x^8y^6}$$

**Solution**

$$\frac{-3y^3}{4x^3}$$

---

$$61. \frac{64q^{11}r^9s^3}{48q^6r^8s^5}$$

---

$$62. \frac{65a^{10}b^8c^5}{42a^7b^6c^8}$$

**Solution**

$$\frac{65a^3b^2}{42c^3}$$

---

$$63. \frac{(10m^5n^4)(5m^3n^6)}{25m^7n^5}$$

---

$$64. \frac{(-18p^4q^7)(-6p^3q^8)}{-36p^{12}q^{10}}$$

**Solution**

$$\frac{-3q^5}{p^5}$$

---

$$65. \frac{(6a^4b^3)(4ab^5)}{(12a^2b)(a^3b)}$$

---

$$66. \frac{(4u^2v^5)(15u^3v)}{(12u^3v)(u^4v)}$$

**Solution**

$$\frac{5v^4}{u^2}$$

---

## Exercises: Mixed Practice

Instructions: For questions 67-80, solve.

67.

- a.  $24a^5 + 2a^5$
  - b.  $24a^5 - 2a^5$
  - c.  $24a^5 \cdot 2a^5$
  - d.  $24a^5 \div 2a^5$
- 

68.

a.  $15n^{10} + 3n^{10}$

b.  $15n^{10} - 3n^{10}$

c.  $15n^{10} \cdot 3n^{10}$

d.  $15n^{10} \div 3n^{10}$

**Solution**

a.  $18n^{10}$

b.  $12n^{10}$

c.  $45n^{20}$

d. 5

---

**69.**

a.  $p^4 \cdot p^6$

b.  $(p^4)^6$

---

**70.**

a.  $q^5 \cdot q^3$

b.  $(q^5)^3$

**Solution**

a.  $q^8$

b.  $q^{15}$

---

**71.**

a.  $\frac{y^3}{y}$

b.  $\frac{y}{y^3}$

---

72.

a.  $\frac{z^6}{z^5}$

b.  $\frac{z^5}{z^6}$

**Solution**

a.  $z$

b.  $\frac{1}{z}$

73.  $(8x^5)(9x) \div 6x^3$

74.  $(4y)(12y^7) \div 8y^2$

**Solution**

$6y^6$

75.  $\frac{27a^7}{3a^3} + \frac{54a^9}{9a^5}$

76.  $\frac{32c^{11}}{4c^5} + \frac{42c^9}{6c^3}$

**Solution**

$15c^6$

$$77. \frac{32y^5}{8y^2} - \frac{60y^{10}}{5y^7}$$

---

$$78. \frac{48x^6}{6x^4} - \frac{35x^9}{7x^7}$$

**Solution**

$$3x^2$$

---

$$79. \frac{63r^6s^3}{9r^4s^2} - \frac{72r^2s^2}{6s}$$

---

$$80. \frac{56y^4z^5}{7y^3z^3} - \frac{45y^2z^2}{5y}$$

**Solution**

$$-yz^2$$

## Exercises: Everyday Math

Instructions: For questions 81-82, answer the given everyday math word problems.

**81. Memory.** One megabyte is approximately  $10^6$  bytes. One gigabyte is approximately  $10^9$  bytes. How many megabytes are in one gigabyte?

---

**82. Memory.** One gigabyte is approximately  $10^9$  bytes. One terabyte is approximately  $10^{12}$  bytes. How many gigabytes are in one terabyte?

**Solution**

$$10^3$$

---

## Exercises: Writing Exercises

Instructions: For questions 83-86, answer the given writing exercises.

**83. Jennifer** thinks the quotient  $\frac{a^{24}}{a^6}$  simplifies to  $a^4$ . What is wrong with her reasoning?

---

**84. Maurice** simplifies the quotient  $\frac{d^7}{d}$  by writing  $\frac{\cancel{d}^7}{\cancel{d}} = 7$ . What is wrong with his reasoning?

**Solution**

Answers will vary.

---

**85. When Drake** simplified  $-3^0$  and  $(-3)^0$  he got the same answer. Explain how using the Order of Operations correctly gives different answers.

---

**86. Robert** thinks  $x^0$  simplifies to 0. What would you say to convince Robert he is wrong?

**Solution**

Answers will vary.

# EXERCISES: DIVIDE POLYNOMIALS (5.6)

---

## Exercises: Divide a Polynomial by a Monomial

Instructions: For questions 1-32, divide each polynomial by the monomial.

1.  $\frac{45y + 36}{9}$

---

2.  $\frac{30b + 75}{5}$

**Solution**

$$6b + 15$$

---

3.  $\frac{8d^2 - 4d}{2}$

---

4.  $\frac{42x^2 - 14x}{7}$

**Solution**

$$6x^2 - 2x$$

---

5.  $(16y^2 - 20y) \div 4y$ 

---

6.  $(55w^2 - 10w) \div 5w$

**Solution**

$11w - 2$ 

---

7.  $(9n^4 + 6n^3) \div 3n$ 

---

8.  $(8x^3 + 6x^2) \div 2x$

**Solution**

$4x^2 + 3x$ 

---

9.  $\frac{18y^2 - 12y}{-6}$ 

---

10.  $\frac{20b^2 - 12b}{-4}$

**Solution**

$-5b^2 + 3b$ 

---

11.  $\frac{35a^4 + 65a^2}{-5}$ 

---

$$12. \frac{51m^4 + 72m^3}{-3}$$

**Solution**

$$-17m^4 - 24m^3$$

---

$$13. \frac{310y^4 - 200y^3}{5y^2}$$

$$14. \frac{412z^8 - 48z^5}{4z^3}$$

**Solution**

$$103z^5 - 12z^2$$

---

$$15. \frac{46x^3 + 38x^2}{2x^2}$$

$$16. \frac{51y^4 + 42y^2}{3y^2}$$

**Solution**

$$17y^2 + 14$$

---

$$17. (24p^2 - 33p) \div (-3p)$$

---

18.  $(35x^4 - 21x) \div (-7x)$

**Solution**

$$-5x^3 + 3$$

---

19.  $(63m^4 - 42m^3) \div (-7m^2)$

---

20.  $(48y^4 - 24y^3) \div (-8y^2)$

**Solution**

$$-6y^2 + 3y$$

---

21.  $(63a^2b^3 + 72ab^4) \div (9ab)$

---

22.  $(45x^3y^4 + 60xy^2) \div (5xy)$

**Solution**

$$9x^2y^3 + 12y$$

---

23. 
$$\frac{52p^5q^4 + 36p^4q^3 - 64p^3q^2}{4p^2q}$$

---

24. 
$$\frac{49c^2d^2 - 70c^3d^3 - 35c^2d^4}{7cd^2}$$

**Solution**

$$7c - 10c^2d - 5cd^2$$

---

$$25. \frac{66x^3y^2 - 110x^2y^3 - 44x^4y^3}{11x^2y^2}$$

---

$$26. \frac{72r^5s^2 + 132r^4s^3 - 96r^3s^5}{12r^2s^2}$$

**Solution**

$$6r^3 + 11r^2s - 8rs^3$$

---

$$27. \frac{4w^2 + 2w - 5}{2w}$$

---

$$28. \frac{12q^2 + 3q - 1}{3q}$$

**Solution**

$$4q + 1 - \frac{1}{3q}$$

---

$$29. \frac{10x^2 + 5x - 4}{-5x}$$

---

$$30. \frac{20y^2 + 12y - 1}{-4y}$$

**Solution**

$$-5y - 3 + \frac{1}{4y}$$

---

$$31. \frac{36p^3 + 18p^2 - 12p}{6p^2}$$

---

$$32. \frac{63a^3 - 108a^2 + 99a}{9a^2}$$

**Solution**

$$7a - 12 + \frac{11}{a}$$

---

## Exercises: Divide a Polynomial by a Binomial

Instructions: For questions 33-54, divide each polynomial by the binomial.

$$33. (y^2 + 7y + 12) \div (y + 3)$$

---

$$34. (d^2 + 8d + 12) \div (d + 2)$$

**Solution**

$$d + 6$$

---

35.  $(x^2 - 3x - 10) \div (x + 2)$

---

36.  $(a^2 - 2a - 35) \div (a + 5)$

**Solution**

$a - 7$

---

37.  $(t^2 - 12t + 36) \div (t - 6)$

---

38.  $(x^2 - 14x + 49) \div (x - 7)$

**Solution**

$x - 7$

---

39.  $(6m^2 - 19m - 20) \div (m - 4)$

---

40.  $(4x^2 - 17x - 15) \div (x - 5)$

**Solution**

$4x + 3$

---

41.  $(q^2 + 2q + 20) \div (q + 6)$

---

$$42. (p^2 + 11p + 16) \div (p + 8)$$

**Solution**

$$p + 3 - \frac{8}{p + 8}$$

---

$$43. (y^2 - 3y - 15) \div (y - 8)$$

---

$$44. (x^2 + 2x - 30) \div (x - 5)$$

**Solution**

$$x + 7 + \frac{5}{x - 5}$$

---

$$45. (3b^3 + b^2 + 2) \div (b + 1)$$

---

$$46. (2n^3 - 10n + 24) \div (n + 3)$$

**Solution**

$$2n^2 - 6n + 8$$

---

$$47. (2y^3 - 6y - 36) \div (y - 3)$$

---

$$48. (7q^3 - 5q - 2) \div (q - 1)$$

**Solution**

$$7q^2 + 7q + 2$$

---

$$49. (z^3 + 1) \div (z + 1)$$

---

$$50. (m^3 + 1000) \div (m + 10)$$

**Solution**

$$m^2 - 10m + 100$$

---

$$51. (a^3 - 125) \div (a - 5)$$

---

$$52. (x^3 - 216) \div (x - 6)$$

**Solution**

$$x^2 + 6x + 36$$

---

$$53. (64x^3 - 27) \div (4x - 3)$$

---

$$54. (125y^3 - 64) \div (5y - 4)$$

**Solution**

$$25y^2 + 20x + 16$$

## Exercises: Everyday Math

Instructions: For questions 55-56, answer the given everyday math word problems.

**55. Average cost.** Pictures Plus produces digital albums. The company's average cost (in dollars) to make  $x$  albums is given by the expression  $\frac{7x + 500}{x}$ .

- Find the quotient by dividing the numerator by the denominator.
- What will the average cost (in dollars) be to produce 20 albums?

**56. Handshakes.** At a company meeting, every employee shakes hands with every other employee. The number of handshakes is given by the expression  $\frac{n^2 - n}{2}$ , where  $n$  represents the number of employees. How many handshakes will there be if there are 10 employees at the meeting?

**Solution**

45

## Exercises: Writing Exercises

Instructions: For questions 57-58, answer the given writing exercises.

**57.** James divides  $48y + 6$  by 6 this way:  $\frac{48y + \cancel{6}}{\cancel{6}} = 48y$ . What is wrong with his reasoning?

**58. Divide  $\frac{10x^2 + x - 12}{2x}$  and explain with words how you get each term of the quotient.**

**Solution**

Answers will vary.

# EXERCISES: USE PROPERTIES OF ANGLES, TRIANGLES, AND THE PYTHAGOREAN THEOREM (6.1)

---

## Exercises: Use the Properties of Angles

Instructions: For questions 1-2, find:

- a. the supplement and
- b. the complement of the given angle

1.  $53^\circ$

**Solution**

a.  $127^\circ$

b.  $37^\circ$

---

2.  $29^\circ$

**Solution**

a.  $151^\circ$

b.  $61^\circ$

---

## Exercises: Use the Properties of Angles

Instructions: For questions 3-10, use the properties of angles to solve.

**3. Find the supplement of a  $135^\circ$  angle.**

**Solution**

$45^\circ$

---

**4. Find the complement of a  $38^\circ$  angle.**

**Solution**

$52^\circ$

---

**5. Find the complement of a  $27.5^\circ$  angle.**

**Solution**

$62.5^\circ$

---

**6. Find the supplement of a  $109.5^\circ$  angle.**

**Solution**

$70.5^\circ$

---

**7. Two angles are supplementary. The larger angle is  $56^\circ$  more than the smaller angle. Find the measures of both angles.**

**Solution** $62^\circ, 118^\circ$ 

---

**8. Two angles are supplementary. The smaller angle is  $36^\circ$  less than the larger angle. Find the measures of both angles.**

---

**9. Two angles are complementary. The smaller angle is  $34^\circ$  less than the larger angle. Find the measures of both angles.**

**Solution** $62^\circ, 28^\circ$ 

---

**10. Two angles are complementary. The larger angle is  $52^\circ$  more than the smaller angle. Find the measures of both angles.**

---

## Exercises: Use the Properties of Triangles

Instructions: For questions 11-22, solve using properties of triangles.

**11. The measures of two angles of a triangle are  $26^\circ$  and  $98^\circ$ . Find the measure of the third angle.**

**Solution** $56^\circ$ 

---

**12. The measures of two angles of a triangle are  $61^\circ$  and  $84^\circ$ . Find the measure of the third angle.**

**Solution**

$35^\circ$

---

**13. The measures of two angles of a triangle are  $105^\circ$  and  $31^\circ$ . Find the measure of the third angle.**

**Solution**

$44^\circ$

---

**14. The measures of two angles of a triangle are  $47^\circ$  and  $72^\circ$ . Find the measure of the third angle.**

**Solution**

$61^\circ$

---

**15. One angle of a right triangle measures  $33^\circ$ . What is the measure of the other angle?**

**Solution**

$57^\circ$

---

**16. One angle of a right triangle measures  $51^\circ$ . What is the measure of the other angle?**

**Solution**

$39^\circ$

---

**17. One angle of a right triangle measures  $22.5^\circ$ . What is the measure of the other angle?**

**Solution**

$67.5^\circ$

---

**18. One angle of a right triangle measures  $36.5^\circ$ . What is the measure of the other angle?**

**Solution**

$53.5^\circ$

---

**19. The two smaller angles of a right triangle have equal measures. Find the measures of all three angles.**

**Solution**

$45^\circ$ ,  $45^\circ$ ,  $90^\circ$

---

**20. The measure of the smallest angle of a right triangle is  $20^\circ$  less than the measure of the other small angle. Find the measures of all three angles.**

---

**21. The angles in a triangle are such that the measure of one angle is twice the measure of the smallest angle, while the measure of the third angle is three times the measure of the smallest angle. Find the measures of all three angles.**

**Solution**

$30^\circ$ ,  $60^\circ$ ,  $90^\circ$

---

**22. The angles in a triangle are such that the measure of one angle is  $20^\circ$  more than the measure of the smallest angle, while the measure of the third angle is three times the measure of the smallest angle. Find the measures of all three angles.**

---

## Exercises: Find the Length of the Missing or Indicated Side

Instructions: For questions 23-24, find the length of the indicated side(s).

23. In the following exercises,  $\triangle ABC$  is similar to  $\triangle XYZ$ . Find the length of the indicated side.

Figure 6P.1.1

### Solution

Side  $b = 12$

Side  $x = 6$

24. On a map, San Francisco, Las Vegas, and Los Angeles form a triangle whose sides are shown in the figure below. The actual distance from Los Angeles to Las Vegas is 270 miles.

Figure 6P.1.2

- Find the distance from Los Angeles to San Francisco.
- Find the distance from San Francisco to Las Vegas.

**Solution**

- a. 351 miles  
b. 567 miles
- 

**Exercises: Use the Pythagorean Theorem**

Instructions: For questions 25-28, use the Pythagorean Theorem to find the length of the hypotenuse.

25.

Figure 6P1.3

**Solution**

15

**Exercises: Pythagorean Theorem Applications**

Instructions: For questions 37-40, solve. Approximate to the nearest tenth, if necessary.

37. A 13 *foot* string of lights will be attached to the top of a 12 *foot* pole for a holiday display. How far from the base of the pole should the end of the string of lights be anchored?

Figure 6P.1.15

**Solution**

5 feet

38. Pam wants to put a banner across her garage door to congratulate her son on his college graduation. The garage door is 12 feet high and 16 feet wide. How long should the banner be to fit the garage door?

Figure 6P.16

**Solution**

20 feet

39. Chi is planning to put a path of paving stones through her flower garden. The flower garden is a square with sides of 10 feet. What will the length of the path be?

Figure 6P.17

**Solution**

14.1 feet

**40. Brian borrowed a 20-foot extension ladder to paint his house. If he sets the base of the ladder 6 feet from the house, how far up will the top of the ladder reach?**

Figure 6P.1.18

**Solution**

19.1 feet

## Exercises: Everyday Math

Instructions: For questions 41-42, answer the given everyday math word problems.

**41. Building a scale model.** Joe wants to build a doll house for his daughter. He wants the doll house to look just like his house. His house is 30 feet wide and 35 feet tall at the highest point of the roof. If the dollhouse will be 2.5 feet wide, how tall will its highest point be?

**Solution**

2.9 feet

**42. Measurement** A city engineer plans to build a footbridge across a lake from point  $X$  to point  $Y$ , as shown in the picture below. To find the length of the footbridge, she draws a right triangle  $\triangle XYZ$  with right angle at  $X$ . She measures the distance from  $X$  to  $Z$  is 800 feet, and from  $Y$  to  $Z$  is 1,000 feet. How long will the bridge be?

Figure 6P.1.19

## Exercises: Writing Exercises

Instructions: For questions 43-44, answer the given writing exercises.

**43. Write three of the properties of triangles from this section and then explain each in your own words.**

**Solution**

Answers will vary.

---

**44. Explain how the figure below illustrates the Pythagorean Theorem for a triangle with legs of length 3 and 4.**

Figure 6P.1.20

# EXERCISES: USE PROPERTIES OF RECTANGLES, TRIANGLES, AND TRAPEZOIDS (6.2)

---

## Exercises: Understand Linear, Square, and Cubic Measure

Instructions: For questions 1-6, determine whether you would measure each item using linear, square, or cubic units.

**1. amount of water in a fish tank**

**Solution**

cubic

---

**2. length of dental floss**

---

**3. living area of an apartment**

**Solution**

square

---

**4. floor space of a bathroom tile**

---

**5. height of a doorway**

**Solution**

linear

---

**6. capacity of a truck trailer**

---

**Exercises: Find the Perimeter**

Instructions: For questions 7-12, find each figure's:

- a. perimeter
- b. area

Assume each side of the square is **1** cm.

**7.**

Figure 6P.2.1

**Solution**

- a. **10** cm
  - b. **4** sq. cm
- 

**8.**

Figure  
6P.2.2

## Exercises: Use the Properties of Rectangles

Instructions: For each rectangle in questions 13-16, find the:

- a. perimeter
- b. area

**13. The length of a rectangle is 85 feet and the width is 45 feet.**

**Solution**

- a. 260 ft
  - b. 3825 sq. ft
- 

**14. The length of a rectangle is 26 inches and the width is 58 inches.**

---

**15. A rectangular room is 15 feet wide by 14 feet long.**

**Solution**

- a. 58 ft
  - b. 210 sq. ft
- 

**16. A driveway is in the shape of a rectangle 20 feet wide by 35 feet long.**

---

## Exercises: Use the Properties of Rectangles

Instructions: For questions 17-40, solve.

**17. Find the length of a rectangle with perimeter 124 inches and width 38 inches.**

**Solution**

24 inches

---

**18. Find the length of a rectangle with perimeter 20.2 yards and width of 7.8 yards.**

---

**19. Find the width of a rectangle with perimeter 92 meters and length 19 meters.**

**Solution**

27 meters

---

**20. Find the width of a rectangle with perimeter 16.2 meters and length 3.2 meters.**

---

**21. The area of a rectangle is 414 square meters. The length is 18 meters. What is the width?**

**Solution**

23 m

---

**22. The area of a rectangle is 782 square centimeters. The width is 17 centimeters. What is the length?**

---

**23. The length of a rectangle is 9 inches more than the width. The perimeter is 46 inches. Find the length and the width.**

**Solution**

7 in., 16 in.

---

24. The width of a rectangle is 8 inches more than the length. The perimeter is 52 inches. Find the length and the width.

---

25. The perimeter of a rectangle is 58 meters. The width of the rectangle is 5 meters less than the length. Find the length and the width of the rectangle.

**Solution**

17 m, 12 m

---

26. The perimeter of a rectangle is 62 feet. The width is 7 feet less than the length. Find the length and the width.

---

27. The width of the rectangle is 0.7 meters less than the length. The perimeter of a rectangle is 52.6 meters. Find the dimensions of the rectangle.

**Solution**

13.5 m, 12.8 m

---

28. The length of the rectangle is 1.1 meters less than the width. The perimeter of a rectangle is 49.4 meters. Find the dimensions of the rectangle.

---

29. The perimeter of a rectangle of 150 feet. The length of the rectangle is twice the width. Find the length and width of the rectangle.

**Solution**

25 ft, 50 ft

---

**30. The length of a rectangle is three times the width. The perimeter is 72 feet. Find the length and width of the rectangle.**

---

**31. The length of a rectangle is 3 meters less than twice the width. The perimeter is 36 meters. Find the length and width.**

**Solution**

7 m, 11 m

---

**32. The length of a rectangle is 5 inches more than twice the width. The perimeter is 34 inches. Find the length and width.**

---

**33. The width of a rectangular window is 24 inches. The area is 624 square inches. What is the length?**

**Solution**

26 in.

---

**34. The length of a rectangular poster is 28 inches. The area is 1316 square inches. What is the width?**

---

**35. The area of a rectangular roof is 2310 square meters. The length is 42 meters. What is the width?**

**Solution**

55 m

---

**36. The area of a rectangular tarp is 132 square feet. The width is 12 feet. What is the length?**

---

**37. The perimeter of a rectangular courtyard is 160 feet. The length is 10 feet more than the width. Find the length and the width.**

**Solution**

35 ft, 45 ft

---

**38. The perimeter of a rectangular painting is 306 centimeters. The length is 17 centimeters more than the width. Find the length and the width.**

---

**39. The width of a rectangular window is 40 inches less than the height. The perimeter of the doorway is 224 inches. Find the length and the width.**

**Solution**

76 in., 36 in.

---

**40. The width of a rectangular playground is 7 meters less than the length. The perimeter of the playground is 46 meters. Find the length and the width.**

---

## Exercises: Use the Properties of Triangles

Instructions: For questions 41-68, solve using the properties of triangles.

**41. Find the area of a triangle with base 12 inches and height 5 inches.**

**Solution**

30 sq. in.

---

**42. Find the area of a triangle with base 45 centimeters and height 30 centimeters.**

---

**43. Find the area of a triangle with base 8.3 meters and height 6.1 meters.**

**Solution**

25.315 sq. m

---

**44. Find the area of a triangle with base 24.2 feet and height 20.5 feet.**

---

**45. A triangular flag has base of 1 foot and height of 1.5 feet. What is its area?**

**Solution**

0.75 sq. ft

---

**46. A triangular window has base of 8 feet and height of 6 feet. What is its area?**

---

**47. If a triangle has sides of 6 feet and 9 feet and the perimeter is 23 feet, how long is the third side?**

**Solution**

8 ft

---

**48. If a triangle has sides of 14 centimeters and 18 centimeters and the perimeter is 49 centimeters, how long is the third side?**

---

**49. What is the base of a triangle with an area of 207 square inches and height of 18 inches?**

**Solution**

23 in.

---

**50. What is the height of a triangle with an area of 893 square inches and base of 38 inches?**

---

**51. The perimeter of a triangular reflecting pool is 36 yards. The lengths of two sides are 10 yards and 15 yards. How long is the third side?**

**Solution**

11 ft

---

**52. A triangular courtyard has perimeter of 120 meters. The lengths of two sides are 30 meters and 50 meters. How long is the third side?**

---

**53. An isosceles triangle has a base of 20 centimeters. If the perimeter is 76 centimeters, find the**

**length of each of the other sides.**

**Solution**

28 cm

---

**54. An isosceles triangle has a base of 25 inches. If the perimeter is 95 inches, find the length of each of the other sides.**

---

**55. Find the length of each side of an equilateral triangle with a perimeter of 51 yards.**

**Solution**

17 ft

---

**56. Find the length of each side of an equilateral triangle with a perimeter of 54 meters.**

---

**57. The perimeter of an equilateral triangle is 18 meters. Find the length of each side.**

**Solution**

6 m

---

**58. The perimeter of an equilateral triangle is 42 miles. Find the length of each side.**

---

**59. The perimeter of an isosceles triangle is 42 feet. The length of the shortest side is 12 feet. Find the length of the other two sides.**

**Solution**

15 ft

---

**60. The perimeter of an isosceles triangle is 83 inches. The length of the shortest side is 24 inches. Find the length of the other two sides.**

---

**61. A dish is in the shape of an equilateral triangle. Each side is 8 inches long. Find the perimeter.**  
**Solution**

24 in.

---

**62. A floor tile is in the shape of an equilateral triangle. Each side is 1.5 feet long. Find the perimeter.**

---

**63. A road sign in the shape of an isosceles triangle has a base of 36 inches. If the perimeter is 91 inches, find the length of each of the other sides.**

**Solution**

27.5 in.

---

**64. A scarf in the shape of an isosceles triangle has a base of 0.75 meters. If the perimeter is 2 meters, find the length of each of the other sides.**

---

**65. The perimeter of a triangle is 39 feet. One side of the triangle is 1 foot longer than the second side. The third side is 2 feet longer than the second side. Find the length of each side.**

**Solution**

12 ft, 13 ft, 14 ft

---

**66. The perimeter of a triangle is 35 feet. One side of the triangle is 5 feet longer than the second side. The third side is 3 feet longer than the second side. Find the length of each side.**

---

**67. One side of a triangle is twice the smallest side. The third side is 5 feet more than the shortest side. The perimeter is 17 feet. Find the lengths of all three sides.**

**Solution**

3 ft, 6 ft, 8 ft

---

**68. One side of a triangle is three times the smallest side. The third side is 3 feet more than the shortest side. The perimeter is 13 feet. Find the lengths of all three sides.**

---

## Exercises: Use the Properties of Trapezoids

Instructions: For questions 69-80, solve using the properties of trapezoids.

**69. The height of a trapezoid is 12 feet and the bases are 9 and 15 feet. What is the area?**

**Solution**

144 sq. ft

---

**70. The height of a trapezoid is 24 yards and the bases are 18 and 30 yards. What is the area?**

---

**71. Find the area of a trapezoid with a height of 51 meters and bases of 43 and 67 meters.**

**Solution**

2805 sq. m

---

**72. Find the area of a trapezoid with a height of 62 inches and bases of 58 and 75 inches.**

---

**73. The height of a trapezoid is 15 centimeters and the bases are 12.5 and 18.3 centimeters. What is the area?**

**Solution**

231 sq. cm

---

**74. The height of a trapezoid is 48 feet and the bases are 38.6 and 60.2 feet. What is the area?**

---

**75. Find the area of a trapezoid with a height of 4.2 meters and bases of 8.1 and 5.5 meters.**

**Solution**

28.56 sq. m

---

**76. Find the area of a trapezoid with a height of 32.5 centimeters and bases of 54.6 and 41.4 centimeters.**

---

**77. Laurel is making a banner shaped like a trapezoid. The height of the banner is 3 feet and the bases are 4 and 5 feet. What is the area of the banner?**

**Solution**

13.5 sq. ft

---

**78. Niko wants to tile the floor of his bathroom. The floor is shaped like a trapezoid with width 5 feet and lengths 5 feet and 8 feet. What is the area of the floor?**

---

**79. Theresa needs a new top for her kitchen counter. The counter is shaped like a trapezoid with width 18.5 inches and lengths 62 and 50 inches. What is the area of the counter?**

**Solution**

1036 sq. in.

---

**80. Elena is knitting a scarf. The scarf will be shaped like a trapezoid with width 8 inches and lengths 48.2 inches and 56.2 inches. What is the area of the scarf?**

## Exercises: Everyday Math

Instructions: For questions 81-84, answer the given everyday math word problems.

**81. Fence.** Jose just removed the children's playset from his back yard to make room for a rectangular garden. He wants to put a fence around the garden to keep out the dog. He has a 50 foot roll of fence in his garage that he plans to use. To fit in the backyard, the width of the garden must be 10 feet. How long can he make the other side if he wants to use the entire roll of fence?

**Solution**

15 ft

---

**82. Gardening.** Lupita wants to fence in her tomato garden. The garden is rectangular and the length is twice the width. It will take 48 feet of fencing to enclose the garden. Find the length and width of her garden.

---

**83. Fence.** Christa wants to put a fence around her triangular flowerbed. The sides of the flowerbed are 6 feet, 8 feet, and 10 feet. The fence costs \$10 per foot. How much will it cost for Christa to fence in her flowerbed?

**Solution**

\$24

---

**84. Painting.** Caleb wants to paint one wall of his attic. The wall is shaped like a trapezoid with height 8 feet and bases 20 feet and 12 feet. The cost of the painting one square foot of wall is about \$0.05. About how much will it cost for Caleb to paint the attic wall?

Figure 6P.2.7

## Exercises: Writing Exercises

Instructions: For questions 85-88, answer the given writing exercises.

**85.** If you need to put tile on your kitchen floor, do you need to know the perimeter or the area of the kitchen? Explain your reasoning.

**Solution**

Answers will vary.

---

**86. If you need to put a fence around your backyard, do you need to know the perimeter or the area of the backyard? Explain your reasoning.**

---

**87. Look at the two figures.**

Figure 6P.2.8

- Which figure looks like it has the larger area? Which looks like it has the larger perimeter?
- Now calculate the area and perimeter of each figure. Which has the larger area? Which has the larger perimeter?

**Solution**

Answers will vary.

---

**87. The length of a rectangle is 5 feet more than the width. The area is 50 square feet. Find the length and the width.**

- Write the equation you would use to solve the problem.
- Why can't you solve this equation with the methods you learned in the previous chapter?

# EXERCISES: SOLVE GEOMETRY APPLICATIONS: CIRCLES AND IRREGULAR FIGURES (6.3)

---

## Exercises: Use the Properties of Circles

Instructions: For questions 1-14, solve using the properties of circles.

- 1. The lid of a paint bucket is a circle with radius 7 inches. Find the**
- a. circumference and**
  - b. area of the lid.**

**Solution**

- a. 43.96 in.
- b. 153.86 sq. in.

- 
- 2. An extra-large pizza is a circle with radius 8 inches. Find the**
- a. circumference and**
  - b. area of the pizza.**

- 
- 3. A farm sprinkler spreads water in a circle with radius of 8.5 feet. Find the**
- a. circumference and**
  - b. area of the watered circle.**

**Solution**

- a. 53.38 ft
  - b. 226.865 sq. ft
- 

- 4. A circular rug has radius of 3.5 feet. Find the**
- a. circumference and
  - b. area of the rug.
- 

- 5. A reflecting pool is in the shape of a circle with diameter of 20 feet. What is the circumference of the pool?**

**Solution**

62.8 ft

---

- 6. A turntable is a circle with diameter of 10 inches. What is the circumference of the turntable?**
- 

- 7. A circular saw has a diameter of 12 inches. What is the circumference of the saw?**

**Solution**

37.68 in.

---

- 8. A round coin has a diameter of 3 centimeters. What is the circumference of the coin?**
- 

- 9. A barbecue grill is a circle with a diameter of 2.2 feet. What is the circumference of the grill?**

**Solution**

6.908 ft

---

**10. The top of a pie tin is a circle with a diameter of 9.5 inches. What is the circumference of the top?**

---

**11. A circle has a circumference of 163.28 inches. Find the diameter.**

**Solution**

52 in.

---

**12. A circle has a circumference of 59.66 feet. Find the diameter.**

---

**13. A circle has a circumference of 17.27 meters. Find the diameter.**

**Solution**

5.5 m

---

**14. A circle has a circumference of 80.07 centimeters. Find the diameter.**

---

## Exercises: Use the Properties of Circles

Instructions: For questions 15-18, find the radius of the circle with given circumference.

**15. A circle has a circumference of 150.72 feet.**

**Solution**

24 ft

---

16. A circle has a circumference of 251.2 centimeters.

---

17. A circle has a circumference of 40.82 miles.

**Solution**

6.5 mi

---

18. A circle has a circumference of 78.5 inches.

---

### Exercises: Find the Area of Irregular Figures

Instructions: For questions 19-38, find the area of the irregular figure. Round your answers to the nearest hundredth.

19.

Figure 6P.3.1

Figure 6P.3.20

## Exercises: Find the Area of Irregular Figures

Instructions: For questions 39-42, solve.

**39. A city park covers one block plus parts of four more blocks, as shown. The block is a square with sides 250 feet long, and the triangles are isosceles right triangles. Find the area of the park.**

Figure 6P.3.21

**Solution**

187,500 sq. ft

**40.** A gift box will be made from a rectangular piece of cardboard measuring 12 inches by 20 inches, with squares cut out of the corners of the sides, as shown. The sides of the squares are 3 inches. Find the area of the cardboard after the corners are cut out.

Figure 6P.3.22

**41.** Perry needs to put in a new lawn. His lot is a rectangle with a length of 120 feet and a width of 100 feet. The house is rectangular and measures 50 feet by 40 feet. His driveway is rectangular and measures 20 feet by 30 feet, as shown. Find the area of Perry's lawn.

Figure 6P.3.23

**Solution**

9400 sq. ft

42. Denise is planning to put a deck in her back yard. The deck will be a 20-ft by 12-ft rectangle with a semicircle of diameter 6 feet, as shown below. Find the area of the deck.

Figure 6P.3.24

## Exercises: Everyday Math

Instructions: For questions 43-44, answer the given everyday math word problems.

43. Area of a Tabletop Yuki bought a drop-leaf kitchen table. The rectangular part of the table is a 1-ft by 3-ft rectangle with a semicircle at each end, as shown.

- a. Find the area of the table with one leaf up.
- b. Find the area of the table with both leaves up.

Figure 6P.3.25

**Solution**

- a. 6.5325 sq. ft
- b. 10.065 sq. ft

**44. Painting** Leora wants to paint the nursery in her house. The nursery is an 8-ft by 10-ft rectangle, and the ceiling is 8 feet tall. There is a 3-ft by 6.5-ft door on one wall, a 3-ft by 6.5-ft closet door on another wall, and one 4-ft by 3.5-ft window on the third wall. The fourth wall has no doors or windows. If she will only paint the four walls, and not the ceiling or doors, how many square feet will she need to paint?

## Exercises: Writing Exercises

Instructions: For questions 45–46, answer the given writing exercises.

**45. Describe** two different ways to find the area of this figure, and then show your work to make sure both ways give the same area.

Figure 6P.3.26

### Solution

Answers will vary.

**46. A circle has a diameter of 14 feet. Find the area of the circle**

- a. using 3.14 for  $\pi$
- b. using  $\frac{22}{7}$  for  $\pi$ .
- c. Which calculation to do prefer? Why?

# EXERCISES: SOLVE GEOMETRY APPLICATIONS: VOLUME AND SURFACE AREA (6.4)

---

## Exercises: Find Volume and Surface Area of Rectangular Solids

Instructions: For questions 1-4, find

- a. the volume and
- b. the surface area of the rectangular solid with the given dimensions.

**1. length 2 meters, width 1.5 meters, height 3 meters**

**Solution**

- a. 9 cu. m
  - b. 27 sq. m
- 

**2. length 5 feet, width 8 feet, height 2.5 feet**

---

**3. length 3.5 yards, width 2.1 yards, height 2.4 yards**

**Solution**

- a. 17.64 cu. yd.
  - b. 41.58 sq. yd.
-

4. length 8.8 centimeters, width 6.5 centimeters, height 4.2 centimeters

---

## Exercises: Find Volume and Surface Area of Rectangular Solids

Instructions: For questions 5-8, solve.

5. Moving van. A rectangular moving van has length 16 feet, width 8 feet, and height 8 feet. Find its
- volume and
  - surface area.

**Solution**

- 1,024 cu. ft
  - 640 sq. ft
- 

6. Gift box A rectangular gift box has length 26 inches, width 16 inches, and height 4 inches. Find its
- volume and
  - surface area.
- 

7. Carton A rectangular carton has length 21.3 cm, width 24.2 cm, and height 6.5 cm. Find its
- volume and
  - surface area.

**Solution**

- 3,350.49 cu. cm
  - 1,622.42 sq. cm
-

**8. Shipping container** A rectangular shipping container has length 22.8 feet, width 8.5 feet, and height 8.2 feet. Find its

- a. volume and
  - b. surface area.
- 

## Exercises: Find Volume and Surface Area of Rectangular Solids

Instructions: For questions 9-12, find

- a. the volume and
- b. the surface area of the cube with the given side length.

**9. 5 centimeters**

**Solution**

- a. 125 cu. cm
  - b. 150 sq. cm
- 

**10. 6 inches**

---

**11. 10.4 feet**

**Solution**

- a. 1124.864 cu. ft.
  - b. 648.96 sq. ft
-

12. 12.5 meters

---

## Exercises: Find Volume and Surface Area of Rectangular Solids

Instructions: For questions 13-16, solve.

13. Science center. Each side of the cube at the Discovery Science Center in Santa Ana is 64 feet long. Find its

a. volume and

b. surface area.

**Solution**

a. 262,144 cu. ft

b. 24,576 sq. ft

---

14. Museum. A cube-shaped museum has sides 45 meters long. Find its

a. volume and

b. surface area.

---

15. Base of statue. The base of a statue is a cube with sides 2.8 meters long. Find its

a. volume and

b. surface area.

**Solution**

a. 21.952 cu. m

b. 47.04 sq. m

---

**16. Tissue box. A box of tissues is a cube with sides 4.5 inches long. Find its**

- a. volume and**
  - b. surface area.**
- 

### Exercises: Find the Volume and Surface Area of Spheres

Instructions: For questions 17-20, find

- a. the volume and
- b. the surface area of the sphere with the given radius.

Round answers to the nearest hundredth.

**17. 3 centimeters**

**Solution**

- a. 113.04 cu. cm
  - b. 113.04 sq. cm
- 

**18. 9 inches**

---

**19. 7.5 feet**

**Solution**

- a. 1,766.25 cu. ft
  - b. 706.5 sq. ft
-

20. 2.1 yards

---

## Exercises: Find the Volume and Surface Area of Spheres

Instructions: For questions 21-24, solve. Round answers to the nearest hundredth.

21. Exercise ball. An exercise ball has a radius of 15 inches. Find its

a. volume and

b. surface area.

**Solution**

a. 14,130 cu. in.

b. 2,826 sq. in.

---

22. Balloon ride. The Great Park Balloon is a big orange sphere with a radius of 36 feet . Find its

a. volume and

b. surface area.

---

23. Golf ball. A golf ball has a radius of 4.5 centimeters. Find its

a. volume and

b. surface area.

**Solution**

a. 381.51 cu. cm

b. 254.34 sq. cm

---

**24. Baseball.** A baseball has a radius of 2.9 inches. Find its

- a. volume and
  - b. surface area.
- 

## Exercises: Find the Volume and Surface Area of a Cylinder

Instructions: For questions 25-28, find

- a. the volume and
- b. the surface area of the cylinder with the given radius and height.

Round answers to the nearest hundredth.

**25. radius 3 feet, height 9 feet**

**Solution**

- a. 254.34 cu. ft
  - b. 226.08 sq. ft
- 

**26. radius 5 centimeters, height 15 centimeters**

---

**27. radius 1.5 meters, height 4.2 meters**

**Solution**

- a. 29.673 cu. m
  - b. 53.694 sq. m
-

**28. radius 1.3 yards, height 2.8 yards**

---

## Exercises: Find the Volume and Surface Area of a Cylinder

Instructions: For questions 29-32, solve. Round answers to the nearest hundredth.

**29. Coffee. can A** can of coffee has a radius of 5 cm and a height of 13 cm. Find its

**a. volume and**

**b. surface area.**

**Solution**

a. 1,020.5 cu. cm

b. 565.2 sq. cm

---

**30. Snack. pack A** snack pack of cookies is shaped like a cylinder with radius 4 cm and height 3 cm. Find its

**a. volume and**

**b. surface area.**

---

**31. Barber shop pole.** A cylindrical barber shop pole has a diameter of 6 inches and height of 24 inches. Find its

**a. volume and**

**b. surface area.**

**Solution**

a. 678.24 cu. in.

b. 508.68 sq. in.

---

- 32. Architecture.** A cylindrical column has a diameter of 8 feet and a height of 28 feet. Find its
- a. volume and**
  - b. surface area.**
- 

### Exercises: Find the Volume of Cones

Instructions: For questions 33-36, find the volume of the cone with the given dimensions.  
Round answers to the nearest hundredth.

- 33. height 9 feet and radius 2 feet**

**Solution**

37.68 cu. ft

---

- 34. height 8 inches and radius 6 inches**
- 

- 35. height 12.4 centimeters and radius 5 cm**

**Solution**

324.47 cu. cm

---

- 36. height 15.2 meters and radius 4 meters**
-

## Exercises: Find the Volume of Cones

Instructions: For questions 37-40, solve. Round answers to the nearest hundredth.

**37. Teepee.** What is the volume of a cone-shaped teepee tent that is 10 feet tall and 10 feet across at the base?

**Solution**

261.67 cu. ft

---

**38. Popcorn cup.** What is the volume of a cone-shaped popcorn cup that is 8 inches tall and 6 inches across at the base?

---

**39. Silo.** What is the volume of a cone-shaped silo that is 50 feet tall and 70 feet across at the base?

**Solution**

64,108.33 cu. ft

---

**40. Sand pile.** What is the volume of a cone-shaped pile of sand that is 12 meters tall and 30 meters across at the base?

---

## Exercises: Everyday Math

Instructions: For questions 41-42, answer the given everyday math word problems.

**41. Street light post.** The post of a street light is shaped like a truncated cone, as shown in the picture below. It is a large cone minus a smaller top cone. The large cone is 30 feet tall with base radius 1 foot. The smaller cone is 10 feet tall with base radius of 0.5 feet. To the nearest tenth,

- find the volume of the large cone.
- find the volume of the small cone.
- find the volume of the post by subtracting the volume of the small cone from the volume of the large cone.

Figure 6P.4.1

### Solution

- 31.4 cu. ft
- 2.6 cu. ft
- 28.8 cu. ft

**42. Ice cream cones** A regular ice cream cone is 4 inches tall and has a diameter of 2.5 inches. A waffle cone is 7 inches tall and has a diameter of 3.25 inches. To the nearest hundredth,

- find the volume of the regular ice cream cone.

- b. find the volume of the waffle cone.**
  - c. how much more ice cream fits in the waffle cone compared to the regular cone?**
- 

## Exercises: Writing Exercises

Instructions: For questions 43-44, answer the given writing exercises.

- 43. The formulas for the volume of a cylinder and a cone are similar. Explain how you can remember which formula goes with which shape.**

**Solution**

Answers will vary.

---

- 44. Which has a larger volume, a cube of sides of 8 feet or a sphere with a diameter of 8 feet? Explain your reasoning.**

# EXERCISES: SINE, COSINE AND TANGENT RATIOS AND APPLICATIONS OF TRIGONOMETRY (6.5)

---

## Exercises: Label Sides of Triangles

Instructions: For questions 1-2, label the sides of the triangle.

1.

Figure 6.P.5.1

**Solution**

Figure 6.P.5.2

---

2.

Figure 6.P.5.3

---

## Exercises: Finding Adjacent or Opposite Sides

Instructions: For questions 3-4, solve.

**3. If the reference angle in Question 1 is B, Find the adjacent?**

**Solution**

c

---

**4. If the reference angle in Question 2 is Z, find the opposite?**

---

## Exercises: Label and Find Sides of a Triangle

Instructions: For questions 5-6, label the sides of the triangle and find the hypotenuse, opposite and adjacent.

5.

Figure 6P.5.4

### Solution

$g$  is opposite,  $f$  is adjacent, and  $e$  is hypotenuse

Figure 6P.5.5

---

6.

Figure 6P.5.6

---

### Exercises: Find the Given Ratios

Instructions: For questions 7-10, use your calculator to find the given ratios. Round to four decimal places if necessary.

7.  $\sin 47^\circ$

**Solution**

0.7314

---

8.  $\cos 82^\circ$

---

9.  $\tan 12^\circ$

**Solution**

0.2126

---

10.  $\sin 30^\circ$ **Exercises: Find the Sine, Cosine, and Tangent of**Instructions: For the given triangles in questions 11-14, find the sine, cosine and tangent of the  $\theta$ .

11.

Figure 6P.5.7

**Solution**

$$\sin \theta = \frac{g}{e}, \quad \cos \theta = \frac{f}{e}, \quad \tan \theta = \frac{g}{f}$$

Figure 6P.5.8

12.

Figure 6P.5.9

13.

Figure 6P.5.10

**Solution**

$$\sin \theta = \frac{s}{r}, \cos \theta = \frac{t}{r}, \tan \theta = \frac{s}{t}$$

14.

Figure 6P.5.11

### Exercises: Find the Missing Side

Instructions: For the given triangles in questions 15-18, find the missing side. Round it to one decimal place.

**15. Find the hypotenuse.**

Figure 6P.5.12

**Solution**

$$b = 19.8$$

---

**16. Find  $b$  if  $a = 6$ .**

Figure 6P.5.13

---

**17. Find the opposite.**

Figure 6P.5.14

**Solution**

$$c = 12$$

---

**18. Find the adjacent.**

Figure 6P.5.15

---

### Exercises: Find the Missing Sides

Instructions: For the given triangles in questions 19-20, find the missing sides. Round it to one decimal place.

**19.**

Figure 6P.5.16

**Solution**

$$y = 19.3, z = 8.2$$

---

20.

Figure 6P.5.17

**Exercises: Solve Triangles**

Instructions: For questions 21-24, solve the triangles. Round to one decimal place.

21.

Figure 6P.5.18

**Solution**

$$\angle B = 61^\circ, \angle C = 29^\circ, \angle D = 90^\circ, b = 38.5, c = 21.3, d = 44$$

---

22.

Figure 6P.5.19

23.

Figure 6P.5.20

**Solution**

$$\angle T = 36.9^\circ, \angle R = 90^\circ, \angle S = 53.1^\circ, t = 15, r = 25, s = 20$$

24.

Figure 6P.5.21

## Exercises: Word Problems

Instructions: For questions 25-30, answer the given word problems.

**25. Kim stands 75 metres from the bottom of a tree and looks up at the top of the tree at a  $48^\circ$  angle. How tall is the tree?**

**Solution**

83.3 m

**26. A tree makes a shadow that is 6 metres long when the angle of elevation to the sun is  $52^\circ$ . How tall is the tree?**

**27. A ladder that is 15 feet is leaning against a house and makes a  $45^\circ$  angle with the ground. How far is the base of the ladder from the house?**

**Solution**

10.6 ft

---

**28. Roxanne is flying a kite and has let out 100 feet of string. The angle of elevation with the ground is  $38^\circ$ . How high is her kite above the ground?**

---

**29. Marta is flying a kite and has let out 28 metres of string. If the kite is 10 metres above the ground, what is the angle of elevation?**

**Solution**

$20.9^\circ$

---

**30. An airplane takes off from the ground at the angle of  $25^\circ$ . If the airplane traveled 200 kilometres, how high above the ground is it?**

# VERSIONING HISTORY

---

This page provides a record of edits and changes made to this book since its initial publication. Whenever edits or updates are made in the text, we provide a record and description of those changes here. If the change is minor, the version number increases by 0.1. If the edits involve a number of changes, the version number increases to the next full number.

The files posted alongside this book always reflect the most recent version.

Version	Date	Change	Affected Web Page

# GLOSSARY TERMS

---

## absolute value

The absolute value of a number is its distance from 0 on the number line. The absolute value of a number  $n$  is written as  $|n|$ .

## accuracy

the degree to which a measure value agrees with the correct value for that measurement

## additive identity

The additive identity is the number 0; adding 0 to any number does not change its value.

## additive inverse

The opposite of a number is its additive inverse. A number and its additive inverse add to 0.

## amount of discount

The amount of discount is the amount resulting when a discount rate is multiplied by the original price of an item.

## angle

An angle is formed by two rays that share a common endpoint. Each ray is called a side of the angle.

## area

The area is a measure of the surface covered by a figure.

## binomial

A binomial is a polynomial with exactly two terms.

## coefficient

The coefficient of a term is the constant that multiplies the variable in a term.

## coincident lines

Coincident lines are lines that have the same slope and same y-intercept.

## complementary angles

Two angles are complementary if the sum of the measures of their angles is 90 degrees.

## complex fraction

A complex fraction is a fraction in which the numerator or the denominator contains a fraction.

## Composite Number

A composite number is a counting number that is not prime. A composite number has factors other than 1 and itself.

## conditional equation

An equation that is true for one or more values of the variable and false for all other values of the variable is a conditional equation.

## cone

A cone is a solid figure with one circular base and a vertex.

## conjugate pair

A conjugate pair is two binomials of the form  $(a-b)$ ,  $(a+b)$ ; the pair of binomials each have the same first term and the same last term, but one binomial is a sum and the other is a difference.

## consistent system

A consistent system of equations is a system of equations with at least one solution.

## constant

A constant is a number whose value always stays the same.

## contradiction

An equation that is false for all values of the variable is called a contradiction. A contradiction has no solution.

## counting numbers

The counting numbers are the numbers 1, 2, 3, ...

## cube

A cube is a rectangular solid whose length, width, and height are equal.

## cylinder

A cylinder is a solid figure with two parallel circles of the same size at the top and bottom.

## decimal

A decimal is another way of writing a fraction whose denominator is a power of ten.

## decreasing linear function

a function with a negative slope: If  $f(x)=mx+b$ ,  $m<0$ .

## degree of a constant

The degree of any constant is 0.

## degree of a polynomial

The degree of a polynomial is the highest degree of all its terms.

## degree of a term

The degree of a term is the exponent of its variable.

## denominator

The denominator is the value on the bottom part of the fraction that indicates the number of equal parts into which the whole has been divided.

## dependent equations

Two equations are dependent if all the solutions of one equation are also solutions of the other equation.

## discount rate

The discount rate is the percent used to determine the amount of a discount, common in retail settings.

## Divisible by a Number

If a number  $m$  is a multiple of  $n$ , then  $m$  is divisible by  $n$ .

## equality symbol

The symbol “=” is called the equal sign.

## equation

An equation is two expressions connected by an equal sign.

## equilateral triangle

A triangle with all three sides of equal length is called an equilateral triangle.

## equivalent decimals

Two decimals are equivalent if they convert to equivalent fractions.

## equivalent fractions

Equivalent fractions are fractions that have the same value.

## evaluate an expression

To evaluate an expression means to find the value of the expression when the variable is replaced by a given number.

## expression

An expression is a number, a variable, or a combination of numbers and variables using operation symbols.

## Factors

If **Formula does not parse**, then  $(a$  and  $b)$  are factors of  $m$ .

## fraction

A fraction is written  $\frac{a}{b}$ , where  $b \neq 0$ .  $a$  is the numerator and  $b$  is the denominator. A fraction represents parts of a whole. The denominator  $b$  is the number of equal parts the whole has been divided into, and the numerator  $a$  indicates how many parts are included.

## geoboard

A geoboard is a board with a grid of pegs on it.

## graph of a linear equation

The graph of a linear equation  $Ax + By = C$  is a straight line. Every point on the line is a solution of the equation. Every solution of this equation is a point on this line.

## horizontal line

A horizontal line is the graph of an equation of the form  $y = b$ . The line passes through the  $y$ -axis at  $(0, b)$ .

## hypotenuse

The side of the triangle opposite the  $90^\circ$  angle is called the hypotenuse.

## identity

An equation that is true for any value of the variable is called an identity. The solution of an identity is all real numbers

## inconsistent system

An inconsistent system of equations is a system of equations with no solution.

## increasing linear function

a function with a positive slope: If  $f(x) = mx + b$ ,  $m > 0$ .

## independent equations

Two equations are independent if they have different solutions.

## integers

The whole numbers and their opposites are called the integers:  $\dots -3, -2, -1, 0, 1, 2, 3 \dots$

## intercepts of a line

The points where a line crosses the x- axis and the y- axis are called the intercepts of the line

## interest

Interest is the money that a bank pays its customers for keeping their money in the bank.

## irrational number

An irrational number is a number that cannot be written as the ratio of two integers. Its decimal form does not stop and does not repeat.

## irregular figure

An irregular figure is a figure that is not a standard geometric shape. Its area cannot be calculated using any of the standard area formulas.

## isosceles triangle

A triangle with two sides of equal length is called an isosceles triangle

## least common denominator

The least common denominator (LCD) of two fractions is the Least common multiple (LCM) of their denominators.

## least common multiple

The least common multiple of two numbers is the smallest number that is a multiple of both numbers

## legs of a right triangle

The sides of a right triangle adjacent to the right angle are called the legs.

## like terms

Terms that are either constants or have the same variables raised to the same powers are called like terms.

## linear equation

A linear equation is of the form  $Ax+By=C$ , where A and B are not both zero, is called a linear equation in two variables.

## linear function

a function with a constant rate of change that is a polynomial of degree 1, and whose graph is a straight line

## list price

The list price is the price a retailer sells an item for.

## mark-up

A mark-up is a percentage of the original cost used to increase the price of an item.

## method of adding percents

the percent uncertainty in a quantity calculated by multiplication or division is the sum of the percent uncertainties in the items used to make the calculation

## mixture problems

Mixture problems combine two or more items with different values together.

## monomial

A monomial is a term of the form  $ax^m$ , where  $a$  is a constant and  $m$  is a whole number; a monomial has exactly one term.

## multiple of a number

A number is a multiple of  $n$  if it is the product of a counting number and  $n$ .

## multiplicative identity

The multiplicative identity is the number 1; multiplying 1 by any number does not change the value of the number.

## multiplicative inverse

The reciprocal of a number is its multiplicative inverse. A number and its multiplicative inverse multiply to one.

## negative slope

A negative slope of a line goes down as you read from left to right.

## number line

A number line is used to visualize numbers. The numbers on the number line get larger as they go from left to right, and smaller as they go from right to left.

## numerator

The numerator is the value on the top part of the fraction that indicates how many parts of the whole are included.

## opposite

The opposite of a number is the number that is the same distance from zero on the number line but on the opposite side of zero:  $-a$  means the opposite of the number. The notation  $-a$  is read “the opposite of  $a$ .”

## ordered pair

An ordered pair  $(x,y)$  gives the coordinates of a point in a rectangular coordinate system.

## origin

The origin is the point labeled 0 on a number line.

## original cost

The original cost in a retail setting, is the price that a retailer pays for an item.

## parallel lines

Lines in the same plane that do not intersect.

## percent

A percent is a ratio whose denominator is 100.

## percent uncertainty

the ratio of the uncertainty of a measurement to the measure value, express as a percentage

## perimeter

The perimeter is a measure of the distance around a figure.

## perpendicular lines

Lines in the same plane that form a right angle.

## point-slope form

The point-slope form of an equation of a line with slope  $m$  and containing the point  $(x_1, y_1)$  is  $y - y_1 = m(x - x_1)$

## polynomial

A polynomial is a monomial, or two or more monomials combined by addition or subtraction.

## positive slope

A positive slope of a line goes up as you read from left to right.

## precision

the degree to which repeated measurements agree with each other

## prime factorization

The prime factorization of a number is the product of prime numbers that equals the number.

## prime number

A prime number is a counting number greater than 1, whose only factors are 1 and itself.

## principal

The principal is the original amount of money invested or borrowed for a period of time at a specific interest rate.

## quadrant

The x-axis and the y-axis divide a plane into four regions, called quadrants.

## radical sign

A radical sign is the symbol  $\sqrt{\phantom{x}}$  that denotes the positive square root.

## rate of interest

The rate of interest is a percent of the principal, usually expressed as a percent per year.

## rational number

A rational number is a number of the form  $p/q$ , where  $p$  and  $q$  are integers and  $q$  does not equal 0. A rational number can be written as the ratio of two integers. Its decimal form stops or repeats.

## real number

A real number is a number that is either rational or irrational.

## reciprocal

The reciprocal of  $\frac{a}{b}$  is  $\frac{b}{a}$ . A number and its reciprocal multiply to one:  $\frac{a}{b} \cdot \frac{b}{a} = 1$ .

## rectangle

A rectangle is a geometric figure that has four sides and four right angles.

## rectangular coordinate system

A grid system is used in algebra to show a relationship between two variables; also called the  $xy$ -plane or the 'coordinate plane'.

## repeating decimal

A repeating decimal is a decimal in which the last digit or group of digits repeats endlessly.

## right triangle

A right triangle is a triangle that has one  $90^\circ$  angle.

## rise

The rise of a line is its vertical change.

## run

The run of a line is its horizontal change.

## scientific notation

A number is expressed in scientific notation when it is of the form  $a \times 10^n$  where  $a \geq 1$  and  $a < 10$  and  $n$  is an integer.

## significant figures

the degree to which repeated measurements agree with each other

## similar figures

A right triangle is a triangle that has one  $90^\circ$  angle.

## simple interest

Simple interest is the interest earned according to the formula  $I = Prt$ .

## simplified fraction

A fraction is considered simplified if there are no common factors in its numerator and denominator.

## simplify an expression

To simplify an expression, do all operations in the expression.

## slope formula

The slope of the line between two points  $(x_1, y_1)$  and  $(x_2, y_2)$  is  $m = \frac{y_2 - y_1}{x_2 - x_1}$

## slope of a line

The slope of a line is  $m = \frac{\text{rise}}{\text{run}}$ . The rise measures the vertical change and the run measures the horizontal change.

## slope-intercept form of an equation of a line

The slope–intercept form of an equation of a line with slope  $m$  and  $y$ -intercept,  $(0, b)$  is,  $y = mx + b$ .

## solution of an equation

A solution of an equation is a value of a variable that makes a true statement when substituted into the equation.

## solutions of a system of equations

Solutions of a system of equations are the values of the variables that make all the equations true. A solution of a system of two linear equations is represented by an ordered pair  $(x, y)$ .

## square and square root

If  $n^2 = m$ , then  $m$  is the square of  $n$  and  $n$  is a square root of  $m$ .

## standard form

A polynomial is in standard form when the terms of a polynomial are written in descending order of degrees.

## supplementary angles

Two angles are supplementary if the sum of the measures of their angles is 180 degrees.

## system of linear equations

When two or more linear equations are grouped together, they form a system of linear equations.

## term

A term is a constant or the product of a constant and one or more variables.

## trapezoid

A trapezoid is four-sided figure, a quadrilateral, with two sides that are parallel and two sides that are not.

## triangle

A triangle is a geometric figure with three sides and three angles

## trinomial

A trinomial is a polynomial with exactly three terms.

### uncertainty

a quantitative measure of how much your measured values deviate from a standard or expected value

### variable

A variable is a letter that represents a number whose value may change.

### vertex of an angle

When two rays meet to form an angle, the common endpoint is called the vertex of the angle.

### vertical line

A vertical line is the graph of an equation of the form  $x=a$ . The line passes through the x-axis at  $(a,0)$ .

### whole numbers

The whole numbers are the numbers 0, 1, 2, 3, ....

### x-coordinate

The first number in an ordered pair  $(x,y)$ .

### x-intercept

The point  $(a,0)$  where the line crosses the x- axis; the x- intercept occurs when y is zero.

### y-coordinate

The second number in an ordered pair  $(x,y)$

### y-intercept

The point  $(0,b)$  where the line crosses the y- axis; the y- intercept occurs when x is zero.
